the new Constitution (1864). It established a Senate and Chamber of Deputies, the former to consist of bishops, generals, and holders of high offices, as well as 64 other members, half of whom were to be nominated by the Prince, the latter to consist of 160 members—85 for Wallachia, 75 for Moldavia—to be chosen by indirect election, the voters choosing electors by whom the Deputies were to be named. Every Ruman above twenty-five years of age who could read and write, and paid about 35 shillings in taxes, was to have a vote. In 1866 a revolution occurred by which Prince Couza was dethroned, and Prince Karl of Hohenzollern-Sigmaringen, who is at present (1878) the reigning Prince, was elected in his place. When, in the spring of 1877, war broke out between Russia and Turkey, a Convention was signed between Russia and R. by which the troops of the former power were to have free passage through the Principalities. On the 21st of May 1877 R. declared itself independent of, and began active hostilities against, Turkey. The Rumanian troops, commanded by Prince Karl, distinguished themselves greatly in the campaign. The independence of R. was confirmed by the Treaty of Berlin (July 1878), and the changes in its frontier described above were agreed upon. At the same time absolute religious equality was insisted on, this clause being intended to ensure the emancipation of the Jews, who had hitherto laboured under severe political, social, and commercial disabilities. The serfdom of the gipsies had been abolished as early as 1849. See Henke, *Rumänien, Land und Volk* (Leip. 1877), and R. J. W. Ozanne, *Three Years in R.* (Lond. 1878).

Rumford, Benjamin Thompson, Count, was born at Woburn, Massachusetts, March 26, 1753. After getting into some trouble as an officer of militia, for supposed disaffection towards the cause of the colonies, he came to England, where he acquired the confidence of Lord George Germaine, Colonial Secretary of State, and was appointed secretary for the province of Georgia. In 1780 he was made under-secretary of State. Soon after he went to America to command the king's American dragoons. Returning to England when peace was proclaimed, he was raised to the rank of colonel. He then entered the Bavarian service. In 1790 R. began the work of suppressing the professional beggars who infested Bavaria, and he succeeded. For other reforms and improvements, such as the establishment of a military school, the improvement of breed in horses and horned cattle, and the transformation of a large tract of hunting-ground near Munich into a public park, he was raised to the rank of major-general, and he became successively member of the council of state, lieutenant-general, commander-in-chief of the general staff, minister of war, and Count of the Holy Roman Empire. After the death of Karl Theodor, Elector of Bavaria, R. retired to Paris, where in 1804 he married the widow of Lavoisier. He spent the remainder of his life in scientific pursuits at Auteuil, where he died 21st August 1814. Of his numerous contributions to scientific journals some of the best are to be found in his *Essays* (4 vols. Lond. 1795-1800). As a physicist, he is famous in connection with the theory of heat, being one of the first who disproved by experiment the then universally accepted caloric theory. (See THERMODYNAMICS). Professor Tait in his *Recent Advances in Physical Science* has not only given prominence to R.'s experiments, but has pointedly called attention to the justness and penetration of the reasoning by which he interpreted them in his *Essays*. To R. the Royal Institution owes its existence. See the elaborate Memoir by G. E. Ellis prefixed to the *Complete Works of Count R.*, published by the American Academy of Arts and Sciences (5 vols. 1876).

Rum'ili or Roumelia (*i.e.* 'Roman land'), the name given by the Turks to the first government which they formed out of the territories wrested from the eastern emperors, and which comprised the whole of the peninsula S. of the Danube and Save, excepting Constantinople, Adrianople, Gallipoli, and Bosnia. The entire European dominion of the Sultan was designated *R. taraf* ('Roman side'), and the Asiatic territory *Anatol taraf* ('Eastern side'). In modern times, after the liberation of Greece, R., subdivided into twenty sandjaks, consisted of Albania, Thessaly, Macedonia, and parts of Bulgaria and Thrace. Sofia was made the capital, and a pasha of two tails governor-general, with the rank of Vizier. By a Hatti-Sherif of 1836 the province was reduced in area, and in 1855, as an eyalet, it was further contracted to the limits of W. Macedonia and N. and Central Alba-

nia, with an area of 15,130 sq. miles, and a pop. of some 1,200,000. Since 1867, when the eyalets of Prisen, Monastir, and Scutari were organised, the name R. has been used only in a geographical, and not in an administrative sense. But since the negotiation of the Treaty of Berlin (13th July 1878), the territory of the former eyalet of R. has been designated *Western R.*, in contradistinction to a newly created province which has received from the Congress the name of *Eastern R.* This new province, extending from the Black Sea to the Rhodope Mountains, and from the Balkans to an arbitrary line drawn across the former vilayet of Adrianople, 'remains under the military and political authority of the Sultan, subject to conditions of administrative autonomy.' Its length from E. to W. is 270 miles, and its greatest breadth from N. to S. is 85. A Christian governor-general is to be appointed by the Porte, with the assent of the Great Powers, for a period of five years. The Sultan has the right of fortifying the frontiers, and appointing the officers of a native gendarmerie and local militia, charged with the maintenance of internal order. After the signature of the Treaty a European Commission was formed for the purpose of settling with the Porte the administrative organisation of Eastern R. and the functions of the governor. All treaties concluded by the Porte shall be applicable to Eastern R., and the Porte engages to maintain the general laws of the Empire as to religious liberty.

Ruminan'tia, a division of quadrupeds belonging to the order *Ungulata* or that of the 'Hoofed' Mammalia. R. are *Artiodactyl* mammals, *i.e.*, they have an even number of toes. The foot is 'cloven,' and consists of a pair (third and fourth) of symmetrical toes encased in hoofs. The metacarpal and metatarsal bones are united to form a single bone—the so-called *cannon bone*, which supports the two useful toes. There are two other smaller and supplementary toes on the back of the foot in most R. A peculiar bone, the *malleolar*, replaces the distal or lower end of the fibula of the hind limb, and articulates above with the *astragalus*, and below with the *calcaneum* of the ankle. There is rarely more than one pair of incisors in the upper jaw of the adult, and these are most frequently wanting, as also are the upper canine teeth. The place of the upper incisors is taken by a hardened pad of gum, against which the lower incisors—numbering six—and lower canines—numbering two—bite, in the act of mastication. There are six molars on each side of the upper jaw, and the same number in the lower jaw, the molars and canines being separated by a considerable *diastema* or interval. The molars are marked on their crowns by two double crescents, the convexities of which are turned outwards in those of the lower, and inwards in those of the upper jaw. The exceptions to the ordinary dentition of the R. as thus described, are found in camels, in which there are two tusk-like upper incisors and upper canines; and in the musk deer, in which are well-developed canines in the upper jaw of the males. The *stomach* of R. is complex, and constitutes the most important feature of the group. It consists of four compartments, erroneously described as distinct 'stomachs.' Probably the first and second compartments of the R. stomach correspond with the anterior or *cardiac* half of the human stomach; the third and fourth compartments corresponding to the *pyloric* portion. The first and largest cavity is named the *rumen* or *paunch*, the walls being set with a number of coarse papillæ. It opens into the second stomach, or *reticulum*, by a wide aperture. The reticulum, also named the *honeycomb*, has its walls thrown into folds forming hexagonal cells. The reticulum opens into the *psalterium* or manyplies (the third compartment) by a small aperture, and its lining membrane is thrown into longitudinal folds resembling the leaves of a book. The fourth compartment, into which the manyplies opens, is called the *abomasum* or *rennet*. It is a slender, elongated portion of the stomach, and its walls are glandular, and secrete *gastric juice*—a fact clearly showing that this latter compartment is to be regarded as the true digestive sac. The *æsophagus* or *gullet* opens into the stomach about midway between the 'paunch' and 'honeycomb.'

In the act of rumination, the animal first swallows the cropped grass, which has been abundantly mixed with saliva, the food passing into the rumen or paunch. There it is moistened, and passes thence into the reticulum, the office of whose honeycombed walls appears to be that of moulding the food into pellets. When the animal is watched, a slight movement of the body, resembling that produced by hiccup, is noticed, and the pellets

of food are propelled upwards into the mouth. Here the food is thoroughly masticated, and is then swallowed for the second time, the food now passing directly into the third stomach or manyplies by the arrangement of the gullet already described. The manyplies appears to serve as a strainer for the food, and thus may strain the food which passes between the reticulum and manyplies, and also separate the liquid from the solid parts of the food after the nutriment has been swallowed for the second time. From the manyplies the food passes into the rennet, which is the true digestive cavity. In the latter compartment the nutriment is dissolved by the action of the gastric juice secreted by its glandular walls. The R. are divided into three chief groups—the *Tragulidae*, or musk deer; the *Cotylophora*, or sheep, deer, oxen, antelopes, &c.; and the *Camelidae*, or *Tylopoda*. When horns are present in R. they are usually double. In the giraffes the horns are outgrowths of the frontal bone of the skull, and thus differ in nature from the core-supported horns of the sheep, deer, &c.

Rump Parliament, The, lasted from December 6, 1648, to April 20, 1653. Cromwell blockaded the parliament with two regiments under command of Colonel Piide. All but the most rigid Independents were excluded; and by this method—'Pride's Purge,' as it was called—forty-one members were confined below the house in a room denominated Hell, 160 were sent home, while only sixty entered the hall. The sixty formed the Rump, passed resolutions approving the conduct of their general, and declared the acts of the parliament for the few days previous illegal. The R. P. likewise arraigned Charles I. for levying an army against the Commons. It tried him, condemned him, and awarded him a traitor's death. Five years afterwards Cromwell quarrelled with the parliament of his own creation, and dissolved the assembly. At his death the R. P. resumed sway, but the soldiers expelled it from Westminster on the 13th of October 1659. The army had soon to give in, however, and allowed the R. P. to govern once more. But the Independents, on March 16, 1660, found themselves in a minority, and this singular travesty of a representative government was soon after broken up.

Rum Shrub is a kind of Liqueur (q. v.), prepared from rum by adding sugar, orange or lemon juice, and water. It is imported from the W. Indies and other places, and like rum it is subject to a duty of 10s. 2d. per gallon.

Run'corn (orig. *Rum-cofan*, 'the wide cove or inlet'), a river-port of England in Cheshire, 28 miles W.S.W. of Manchester by rail, on the S. bank of the Mersey, which is here spanned by a splendid railway viaduct (1864-68) of 101 arches, the bridge proper consisting of three clear spans of 305 feet each, flanked at either end by towers 128 feet above high-water mark. R. has two churches, All Saints (1849) and Holy Trinity (1838), several chapels, a townhall (1830), market-hall (1856), public hall (1867), theatre, &c., and publishes two newspapers. Since the transfer of the R. and other property to the Bridgewater Navigation in 1872, upwards of £50,000 has been expended on the improvement of the port, including a canal connecting R. with Weston Point. Opened in 1876, this canal is 1 mile long by 100 feet wide, and admits vessels of 15 feet draught. In 1877 there entered 2297 vessels of 175,307 tons, and cleared 1661 of 157,096 tons; and on December 31st of that year 137 vessels of 7763 tons, besides 24 fishing-boats, were registered as belonging to the port. The exports amounted (1876) to £21,575; the imports to £136,999, and the customs to £1059. A soap and alkali factory employed 92 men in 1871, the chemical works 329, the tanneries 113, and the limestone quarries 161 men; and there are also rope and sail factories, shipbuilding yards (three British sailing-vessels of 232 tons in 1877), corn mills, and an iron foundry. Pop. (1871) 19,460. R. is an ancient place, where Ethelsleda founded a castle in 916, and William of Chester an Augustine priory in 1133, but it had sunk to a mere fishing-village in the last century, and owes its prosperity to its situation as terminus of the Bridgewater Canal.

Rune (Old Eng. *run*, Ger. *rune*, Goth. *runa*, and Icel. *run*) is a word probably connected with the Low German verb *raunen*, 'to cut,' or 'to carve'; hence, as the runes were in olden times invariably cut or carved, they came in a special sense to mean the cutting or carving of letters, consequently the letters themselves. From the runes being known in the sense of letters, many other significations are found in the oldest writings of the Teutonic nations. Already by Ulfilas the word *runa* is employed

to translate *mysterion*. This meaning was directly derived from the fact, that comparatively few persons were skilled in the use of the runes, and the knowledge of them was looked upon as something hidden and mysterious, if not uncanny. In Scandinavia they were, from the earliest times, connected with sorcery and witchcraft, and the tradition of their being so used has hardly yet died out in Iceland. From the fact of the runes being used in the communication of thought, may be derived several other meanings which we find attached to the word; e.g., it came to mean counsels, secret and confidential communications; lastly, every kind of acquired knowledge, ancient lore, and traditions. Nouns, adjectives, and verbs derived from the word *run* conveyed analogous meanings, as friendly counsellor, confidential friend; studious, well skilled in ancient lore; and to inquire into.

In course of time the word R. came to be exclusively applied to the alphabets used by the Teutonic nations before the introduction of Christianity, and of the Greek and Roman letters. In the Icelandic sagas we are told that Odin first taught the people of the North the use of runes. It is not, however, probable that they were a Teutonic invention. It is much more likely that they owe their origin to a still earlier alphabet. Some are of opinion that they are only a transformation of the Greek characters; and there is certainly great similarity between many of the Greek characters and the Runic letters. Others have suggested that they may have been derived from the Phœnician alphabet, or even from the cuneiform character. However that may be, it is certain that their origin dates further back than the earliest historical records which we have of the Teutonic nations.

The runes have been divided into three classes, viz., the Old English runes, the German runes, and the Scandinavian runes. There is, however, no greater difference between these three alphabets than there are in the respective modern alphabets themselves. The division is therefore more local than real, that is, the runes have been divided into classes according to where the Runic monuments have been found. One peculiarity they have in common, viz., the arrangement of the letters. The alphabet does not begin with *a*, and run on *b, c, d, e, f, &c.*, but with *f*, and runs on *u, th, o, r, k, &c.*; hence it is by some antiquarians called the *Futhork* alphabet. Usually the runes read from left to right, yet sometimes from right to left. The following are the Runic alphabets in order of the English alphabet:—

Mod. English Alphabet.	Scandinavian Runes.	Old English Runes.	German Runes.
a	ᚦ	ᚦ	ᚦ
b	ᚷ	ᚷ	ᚷ
c			
d		ᚹ	ᚹ
e		ᚺ	ᚺ
f	ᚱ	ᚱ	ᚱ
g		ᚷ	ᚷ
h	ᚨ	ᚨ	ᚨ
i	ᚦ	ᚦ	ᚦ
j		ᚨ	ᚨ
k	ᚱ	ᚱ	ᚱ
l	ᚦ	ᚦ	ᚦ
m	ᚱ	ᚱ	ᚱ
n	ᚱ	ᚱ	ᚱ
o	ᚱ	ᚱ	ᚱ
p			
q			
r	ᚱ	ᚱ	ᚱ
s	ᚱ	ᚱ	ᚱ
t	ᚱ	ᚱ	ᚱ
u	ᚱ	ᚱ	ᚱ
v	ᚱ	ᚱ	ᚱ
w			
x			
y	ᚱ	ᚱ	ᚱ
z			
Additional letters.			
th	ᚱ	ᚱ	ᚱ
ö			

Both in the Old English and the German runes there are a great many variations which have been omitted. It will be seen from these alphabets that there are several letters wanting in the Scandinavian alphabet. Some of them are not even yet wanted in the Scandinavian tongue, or Icelandic, as *c* and *g*; no more are the *x* and *z*, if the language is written phonetically. The *d*, *e*, *j*, and *p*, are, however, necessary to the language as it now is, and have been all the time since we had any literature in it. In later runes the *d* has been represented by *ᚔ*, the soft *d*, or *ᚕ* by *ᚕ*, the *e* by *ᚢ*, or *ᚦ*, the *g* by *ᚷ*, the *j* by *ᚢ* and the *p* by *ᚱ*. We do not know whether these letters were necessary at that state of the language when the runes first came into use. The probability is that they were not. Each letter of the runes was named by a word which began with the letter in question, thus *A* was called *dr*, 'year, season.' In other respects the word had no more connection with the letter than books has with *b*, or dove has with *d*; just as we see in the nursery books, *b* means a book, and *d* means a dove.

The question has been raised, which of the three alphabets was the oldest, or the original, from which the others were derived? It has been surmised that the Old English alphabet was the original, and that the Scandinavian was merely an abridgment of it. The common opinion, however, is that the Scandinavian is the oldest, and it certainly seems to point to a language in a less perfect state of development than the Old English. This fact, together with the simplicity of the Scandinavian runes, may almost be regarded as establishing its greater antiquity. On the other hand, it is quite possible that the three alphabets are independent offshoots from a parental stem which has now wholly disappeared.

There is no such thing as a Runic literature. The runes were not used for literary purposes, but for inscriptions only. These inscriptions are found on stone monuments; on implements of war, e.g., swords, shields, &c.; on personal ornaments, as arm-rings; on household furniture and other implements in common use, as chairs, benches, doors, spoons, drinking-horns, dice, &c. Not only were the runes used in the times of heathenism, but also long after Christianity was introduced, and several stone crosses have been found in the N. of England with Runic inscriptions. By far the largest number of these monuments have been found in Scandinavia, Denmark, and Iceland; but a considerable number have also been discovered in Shetland, the Orkneys, the N. of Scotland, the N. of England, and especially in the Isle of Man. In fact, the Northmen seem to have left traces of their runic writing, or rather carving, wherever they went. It is worth remarking for those who believe in the prior origin of the Old English runes, that nearly all the runic monuments found in England occur in the N., where the Scandinavian element predominated. In Germany hardly any Runic monuments have been found.

The most important publications on runes are:—*The Old Northern Runic Monuments of Scandinavia and England*, now first collected by George Stephens (1866-68). An interesting chapter on the Old English runes is in D. H. Haigh's *Conquest of Britain by the Saxons* (1861). Other publications on the runes are J. G. Liljegren, *Runnara* (1832); J. M. Kemble, *Runes of the Anglo-Saxons*, in the *Archæologia* (vol. xxviii., 327, 1840); Finn Magnusen, *Om Runerne og Runerne* (1841); A. Kirchhoff, *Das gothische Runen Alphabet*; R. von Liljencross and K. Müllenhoff, *Zur Runenlehre* (1852); R. Dybeck, *Svenska Runurkunder* (1855), *Sveriges Runurkunder* (1860); J. G. Cumming, *The Runic and other Monumental Remains in the Isle of Man* (1857); James Farrer, *Notice of Runic Monuments in the Orkneys* (1862); P. G. Thorsen, *De danske Runemindermaerker* (1863); L. F. A. Wimmer, *Runeskriftens Oprindelse og Udvikling i Norden* (1874); W. C. Grimm, *Über deutsche Runen*; and Wilhelm Grimm, *Zur Literatur der Runen*, in vol. xlii. of *Jahrbücher der Literatur*. Throughout the *Annaler for Nordisk Oldkyndighed* and *Antiquarisk Tidsskrift* are found numerous descriptions of Runic finds.

Ru'neberg, Johan Ludvig, Sweden's greatest lyrist, was born February 5, 1804, at Jakobstad, in Finland (then under Sweden), and brought up at Uleaborg, on the Gulf of Bothnia. At eighteen he left Vasa school for the University of Åbo (q. v.), where he graduated in 1827. After this he was appointed 'Docens eloquentiæ' at Helsingfors in 1830, in which year he published his first volume of *Dikter*, and a collection of *Serviska*

folksaenger. The poem *Grafven i Perthe* followed in 1831. From 1832 to 1837 R. edited the *Helsingfors Morgonblad*, which he enriched with many critical essays. To this period of intense activity belong some of his noblest works, *Elfskyttarne* (1832), a second volume of *Dikter* (1833), the comedy *Friaren fraan Landet* (1834), and the charming love-idyll *Hanna* (1836). With his appointment to the Latin 'Lectorship' at Borgaa Gymnasium (1837), R.'s life entered on a new phase. No longer forced to write prose for bread, he gave his whole soul to the poetic art. To this period belong the romance *Nadeschda* (1841), the idyll *Fulqvällen* (1841), a third volume of *Dikter* (1843), the epic *Kung Kjalmar* (1844), and the first series of *Fänrik Ståls Sagner*, among which are the finest lyrics in the Swedish language. From 1842 R. had confined himself to lecturing on Greek at Borgaa, and from 1847 to 1850 he was rector of the college. In 1851 he visited Sweden for the first time. He was everywhere received with enthusiasm, and was made a member of the Swedish Academy. In 1854 his critical prose writings were collected in a volume named *Smarre berättelser*, and from 1853 to 1857 he was engaged in bringing out a Swedish psalter for Finland. His last writings were a second series of *Fänrik Ståls Sagner* (1860), the domestic comedy *Kan ej* (1862), and the Greek tragedy *Kungarne paa Salamis* (1863), closely modelled upon Sophocles. In 1864 he was attacked by a fatal disease, under which he lingered on till the 6th May 1877, when he died at Helsingfors. In Scandinavia R. is the most popular poet of our time. Yet the form of his verse is of classic precision, and his works are distinguished by a masterly union of antique sobriety and modern romanticism which gives to them a stamp of classical delicacy and refinement. See *J. L. R.'s Lyrical Songs, Idylls, and Epigrams, Done into English* by Eirikr Magnússon, M.A., and E. H. Palmer, M.A. (Lond. 1878).

Bungpur, the chief town of the district of the same name in Bengal, British India, on the left bank of the Ghogat River, 268 miles N.E. of Calcutta. Pop. (1872), including suburbs, 14,845. It will be the terminus of a branch from the new State Railway to Darjeeling.—The district of R., which is bounded E. by the Bialmaputra, and intersected by many tributaries of that river, has an area of 3476 sq. miles. Pop. (1872) 2,149,972, chiefly Mahomedans. It is throughout flat and swampy, but fertile. The crops are rice, jute, and tobacco, of which the two latter are largely exported. The manufactures are paper-making, carpet and silk-cloth weaving, mat-making, and ivory-carving. In 1876-77 the exports by river were valued at £932,000, including jute £346,000, tobacco £278,000, cotton £67,000, and rice £37,000; the imports were valued at £480,000, chiefly piece-goods £163,000, salt £99,000, and betel-nuts £32,000. The principal mart is Ghoramara.

Runjeet Singh (Ranjit), the Lion of the Punjab, the great warrior and statesman who welded the religious community of the Sikhs into an independent nation. He was the son of a powerful Sikh chieftain called Maha Singh, and was born at Gugaranwalla, 2d November 1780. He first distinguished himself in 1799, by affording assistance to Zeman Shah, the Afghan Emperor, in transporting his heavy cannon across the Jhelum river. For this service he was made governor of Lahore. In 1802 he acquired Umritsir, the sacred city of the Sikhs. In 1805, at a general council of the community, he was virtually admitted as their temporal chief, on the policy of excluding from the Punjab all foreigners—Afghans, Mahrattas, and English; and in the following year he entered into a formal engagement of friendship with Lord Lake. In 1809, owing to suspicions of French designs, Mr. (afterwards Lord) Metcalfe was sent to him as ambassador, and a treaty was entered into, and always faithfully kept, which confined him to the N. and W. of the Sutlej river. Meanwhile he was gradually extending his power in other directions. He conquered Lûdiana in 1806 and Kangra in 1809. In 1813 he took advantage of the necessities of the exiled Afghan Emperor, Shah Shujah, to extract from him the celebrated Kohinur diamond. Multan and Peshawur were captured in 1818; and the valley of Cashmere, the great object of his ambition, in the following year. His system of government was based upon his army of native Sikhs (disciplined by French and Italian officers), who numbered 50,000 men, with 300 cannon. Though he could neither read nor write, he transacted all business himself; and all his acts were asserted to be done 'for the sake of the guru, for the advantage of the

Khalisa, and in the name of the Lord.' Latterly, he was drawn closer to the English. In 1826 he requested the aid of an English surgeon, which led to the appointment of a political agent at Lüdiana, then a British cantonment. In 1831 occurred the celebrated interview between him and Lord William Bentinck, at Rūpur, on the banks of the Sutlej, which has been called 'the Indian field of the cloth of gold.' The succeeding governor-general, Lord Auckland, persuaded him to give up his designs upon Scinde, and co-operate in the ill-fated expedition to Afghanistan; but he died on 27th June 1839, before the first capture of Cabul was effected.

Runn of Kutch (*Ran of Kachh*), a peculiar depression of the soil, extending over about 8000 sq. miles, which separates the native State of Kutch (q. v.), in India, from the neighbouring province of Scinde on the N. It is reckoned as part of the State. It is believed to represent the dried-up bed of an ancient inland sea, and the neighbourhood is especially liable to earthquakes. During the greater part of the year it is dry ground, and the surface becomes encrusted with a thick layer of salt, which attracts antelopes and wild asses. But at the time of the monsoons the sea pours in both at the E. and S.W. end, and being augmented by some small swollen rivers, turns Kutch into an island.

Runn'er, in botany, is a name given to young plants formed at the end, or at the nodes of branches or stocks creeping wholly or partially above ground, or sometimes it is applied to the prostrate creeping stocks themselves. The strawberry is a familiar example.

Runn'ers, Scar'let. See KIDNEY BEAN.

Runn'y mede, a Surrey meadow stretching along the southern bank of the Thames, opposite Charter Island, and 2 miles W. of Staines. Here, June 15, 1215, the barons were encamped, John lying on the opposite shore, and either here or on the island (it is not determined which) was signed the Great Charter (q. v.). Horse-races have been held here from time immemorial, and hence the name is interpreted by some as 'running-mede,' by others as 'the meadow of the runes,' or 'of the *rynes*' (Old Eng. 'water-brooks').

Rupée (from the Sansk. *rupiya*, 'silver'), the silver coin which is the standard measure of value throughout India. It was first struck by the Afghan Emperor Shere Shah, and forthwith adopted by Akbar and the Mogul dynasty. It then weighed 175 grains Troy, and was supposed to be pure. In early days the right of coinage was exercised by many grades of subordinate governors, and the variations in value were a regular source of profit to the *shroffs* or money-lenders. The English first received permission to open a mint at Calcutta in 1757 as a result of the battle of Plassey. From 1773 the Sicca R. was coined, weighing 170·66 grains troy, and worth about 2s. 2d. This gradually drove out the native rupces of Moorshedabad, Benares, and Furruckabad. At Madras the Arcot R., and at Bombay the Surat R., were adopted. In 1835, the present coin (then called the Company's R.), weighing exactly 180 grains troy, including 5 of alloy, was introduced for all India. It was regarded, at par, as equal to 2s. 0½d.; but in 1876 the Indian rate of exchange fell to 1s. 7d. The weight of the R. is one *tola*, and is the universal standard of weight, both for jewellers and as a multiple also for heavy goods.

Ru'pert (Ger. *Ruprecht*), **Prince, of Bavaria**, born in 1619, was the son of Friedrich V., Elector Palatine, and Elizabeth, eldest daughter of James I. of England. Charles I., his uncle, in 1642 put him at the head of a cavalry regiment, and he captured Cirencester, Hereford, Lichfield, and took part in the battles of Worcester, Edgehill, and Chalgrove Field. Henrietta Maria had said of him that he was 'a person that is capable of doing anything that he is ordered, but he is not to be trusted to take a single step out of his own head.' His impetuous bravery compensated in the king's eyes for his want of caution, and he was created Knight of the Garter and Duke of Cumberland. He took Bristol, July 27, 1643, and routed the Parliament army at Newark, but at Marston Moor ruined his cause by disregarding the movements of his colleague, the Marquis of Newcastle, and hastily retreating from the field. Notwithstanding this error, he was soon afterwards appointed commander of all the royal troops. After the defeat of Naseby (June 14, 1645), he retired to Bristol, but surrendered that city on the 22d of

August. The king thereupon deprived him of his commission. In 1648, for lack of any competent man, he was appointed to command the fleet. He was blockaded by Blake in Kinsale Harbour, and in October, 1649, forced his way out and steered for Lisbon. Blake pursued him, and R. was only saved by assistance from the King of Portugal. R. was again attacked by the same admiral at Carthage, and this time invoked the protection of Spain. But in January, 1651, the prince destroyed some British merchantmen at Malaga, and Blake burnt nearly all his vessels. R. escaped to the West Indies, where for a time he was little better than a pirate. After the restoration of Charles II. he was made a privy councillor, and served under the Duke of York against the Dutch. He again commanded the fleet for a short time, but during the last nine years of his life occupied himself in artistic and scientific pursuits at Windsor Castle, of which he was governor. He died at Spring Gardens, November 29, 1682. He was buried in Henry VII.'s Chapel, Westminster Abbey. See Treskow, *Leben des Prinzen R. von der Pfalz*, (2d ed. Berl. 1857); and Spruner, *Pfalzgraf R. der Cavalier* (Munch, 1854).

Ru'pert's Land, the official name of that part of the N.W. Territories in the Dominion of Canada, the waters of which flow into Hudson's Bay. Its W. boundary runs S.E. from Deer Lake, and on the N., S., and E. it is bounded by the watersheds of the Arctic Ocean, the river St. Lawrence, and the Atlantic Ocean. It slopes inwards to Hudson's Bay, and is well watered by the Churchill, Nelson, Hill, Severn, Equan, Albany, and Rupert rivers. The soil is very fertile, but the severe and variable climate is unfavourable to agriculture. Beavers, bears, otters, and musk-rats are abundant, and are pursued for their skins, which form the only commercial product of the district. Foxes, wolves, reindeer, wapiti, moose, and musk-oxen are also found. The population is extremely scanty.

Ru'pia is a skin disease, sometimes caused by general debility, intemperance, previous diseases, such as smallpox or scarlatina, but more frequently syphilitic in its origin. R. commences as a bullous eruption. The serous fluid degenerates into pus, which dries up into a rough, coarse, prominent scab, which remains attached for some time and then falls off, leaving a circular ulcer. Sometimes the ulcer spreads without any falling off of the scab, and thus a larger scab forms under the original one and raises it up, and so on until a projecting mass is formed like a limpet-shell.

All forms of R. being attended with debility, the treatment must be by generous diet, fresh air, and tonics. Iodide of potassium should afterwards be administered, and this should be followed by mild mercurial fumigations. In the early stage of the eruption the bullæ should be punctured, and when the scabs are formed they should be removed by poulticing, and the exposed surfaces dressed antiseptically.

Rupp'in, Neu, a small town of Prussia, province of Brandenburg, on the Lake of R., which has communication with the Elbe, 37 miles N.W. of Potsdam. It has a castle, lunatic asylum, tanneries, spinning-mills, cloth and chicory manufacture, and large cattle markets. Pop. (1875) 12,501.

Rupture. See HERNIA.

Rural Dean, a beneficed clergyman charged with the inspection of a deanery, or subdivision of an archdeaconry, under the supervision of his bishop. The office having fallen into disuse was revived by Bishop Burgess of Salisbury in 1825, but its duties are for the most part still practically transferred to the archdeacon.

Ru'rik, according to Russian chroniclers the founder of the Russian monarchy, was the leader of a band of Northmen called 'Russians' (*Roussi*) is to this day the Finnish name for the Swedes), who in 862 A.D. crossed the sea from the part of Sweden now called Sönderjylland, and penetrated the country of the Slavs as far as Novgorod, where they established themselves, and R. ruled till his death in 879. In 864 another body of Russo-Northmen, under Dyr and Oskold, seized the Polish city of Kiev, and founded there a new state under the name of the Duchy of Kiyof or Kiev. Fresh bands poured into the country, and by the year 1000 Wladimir, great-grandson of R., became ruler of the Grand Duchy of Kiev, which was extended under the new dynasty from the Gulf of Finland to beyond the confluence of the Dnieper and the Desna. It is said that the line of R. ruled Russia till it died out with Feodor, son of Ivan the Terrible.

Rusa, a genus of *Cervidae* or Deer, represented by the Sambar or Samba (*Rusa Aristoteletis*) of India, which attains a size exceeding that of the red deer. It inhabits the neighbourhood of water. The male has a prominent mane. The horns are long, and have a snag or branch just above the crown. The tips of the horns are forked. The colour is a dark brown. The R. is powerful and vicious. The Axis deer (*Axis maculata*) is another of the Rusine deer.

Ruscus. See BUTCHER'S BROOM.

Rush (Old Eng. *rise*), or **Juncus** (Lat. *jungo*, 'I join,' from its use in 'tying'), is the type genus of the natural order *Juncaceae*, and consists of upwards of 100 species of glabrous herbs, distributed chiefly through the temperate and Arctic regions: 23 species are met with in the range of British Floras. The plants have small greenish or brown flowers arranged in heads or panicles. The perianth consists of six scarious segments; the stamens are usually six; style one, with three stigmas; the ovary mostly three-celled; the ovules numerous; the capsule completely or incompletely three-celled; and the seeds with a very minute embryo. Most of the species are found in damp or wet ground, either inland, or on the sea-coast, or on high mountains. Previous to the introduction of carpets, the common species of R. were used for covering the floors of rooms. The stems of *J. conglomeratus* and *J. effusus* also serve for plaiting into mats, for chair-bottoms, &c.; and the 'pith' of these species was made use of for the slow-burning rushlight candles. The name R. has been given to a number of plants of various genera from their more or less R.-like appearance; thus bog R. is *Scheuchzeria palustris*, bulrush is *Scirpus lacustris*, flowering R. is *Butomus umbellatus*, and Dutch R. or scouring R. is *Equisetum hyemale* (q. v.).

Rush, Benjamin, M.D., LL.D., born near Philadelphia, 24th December 1745, graduated at Princeton, and after studying medicine in Philadelphia, Edinburgh, London, and Paris, began practice in Philadelphia in 1769, when he was made professor of chemistry in the college there. He took a leading part in bringing about the Declaration of Independence, was a member of the Continental Congress in June, and one of those who signed on July 4, 1776. Next year he became surgeon-general and physician-general to the army of the middle department, resigned next year from disgust at the mismanagement of the military stores; established in 1785 the first dispensary in the United States, and was a member in 1787 of the Pennsylvania Convention for ratifying the Federal Constitution. In 1789 he became medical professor at Philadelphia; is said to have saved the lives of 6000 persons during the yellow-fever epidemic of 1793; gained a practice so wide that he is said to have prescribed for 100 patients a day; and from 1799 till his death (19th April 1813) held the office of treasurer of the United States Mint. Besides valuable medical works, such as his *Medical Inquiries and Observations, Diseases of the Mind, Medical Tracts*, &c., he wrote much upon political, religious, social, and ethical topics, as in his *Essays, Literary, Moral, and Philosophical*.

Rush-Nut, a name for the tubers of *Cyperus esculentus* (q. v.).

Rushworth, John, born in Northumberland about 1607, studied for a short time at Oxford, entered Lincoln's Inn, and was called to the bar. He never, however, practised; and as early as 1630 would seem to have entered on the task of chronicling the history of his times, from day to day taking down shorthand notes in the Star and Exchequer Chambers, the Council, and other public places. In 1640 he became assistant clerk to the Long Parliament, in 1645 secretary to his kinsman Sir Thomas Fairfax, and in 1649 member for Berwick-upon-Tweed. The Restoration proved R.'s undoing, for though he became Sir Orlando Bridgman's secretary (1677), and sat again for Berwick (1679-81), he was arrested for debt (1684), and lodged in the King's Bench, where he died, May 12, 1690. R.'s single but enormous work, *Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament* (8 vols. Lond. 1659-1701; 2d ed. 1721), described by Mr. Green as 'invaluable for any exact study of the times,' covers the period 1618-48, one entire volume being devoted to the trial of the Earl of Strafford.

Ruskin, John, the son of a wealthy wine-merchant, was born at London, February 1819. He entered Christ Church,

Oxford, as a gentleman commoner, took the Newdegate Prize in 1839 for a poem entitled *Salsette and Elephanta*, and proceeded to his degree in 1842. He studied the rudiments of art under Copley Fielding and J. D. Harding, and commenced his literary career as a defender of Turner, in *Modern Painters, their Superiority in the Art of Landscape Painting to all Ancient Masters Proved, &c.*, by a Graduate of Oxford (vol. i. 1843). The glow of a youthful and sensitive imagination threw its charm over all the pages of this volume. The critics, however, fell foul of its great faults—faults of all his subsequent works—an extreme dogmatism, and a passion for singularity. This defence of Turner developed into a plea for fidelity to nature, and ultimately into a system of art, occupying five volumes (vol. ii., 1846; vols. iii. and iv., 1856; vol. v., 1860). R. next determined to attempt a reform in domestic architecture, and the result was the publication of his *Seven Lamps of Architecture* (1849), and *Stones of Venice* (3 vols. 1851-53), both treatises illustrated by himself. His curious politico-ecclesiastical brochure, *Notes on the Construction of Sheepfolds*, appeared in 1851, followed by *The King of the Golden River* (1851); *The Two Paths* (1854); *Lectures on Architecture and Painting* (1854); *The Opening of the Crystal Palace* (1854); *On the Nature of Gothic Architecture* (1854); *Giotto and his Works* (1855); *The Harbours of England* (1856); *Notes on the Turner Collection* (1857); *The Political Economy of Art* (1858); *The Cambridge School of Art* (1858); *Elements of Perspective* (1859); *Decoration and Manufacture* (1859); *Unto this Last* (1862); *Ethics of the Dust* (1865); *Sesame and Lilies* (1865); *The Study of Architecture in our Schools* (1865); *The Crown of Wild Olive* (1866); *Time and Tide* (1868); *The Queen of the Air—the Greek Myths of Cloud and Storm* (1869); *Lectures on Art* (1870); *Aratra Pentelici—the Elements of Sculpture* (1872); *The Eagle's Nest* (1872); *Michael Angelo and Tintoret* (1872); *Ariadne Florentina* (six lectures on wood and metal engraving delivered at Oxford, 1872); *Love's Meinie* (1873); *Val d'Arno* (1874); *Proserpina* (1875-76); *Frondes Agrestes—Readings in Modern Painters* (1875); *Deucalion* (1876); *Mornings in Florence* (6 parts, 1877); *The Laws of Fésole* (1877); an edition of Xenophon's *Economics*; the first volume of a series entitled *Bibliotheca Pastorum*; and *Notes on the Turner Collection* (1878). *Unto this Last* is an attack upon the doctrines of political economy, and exhibits many of the extravagances of R.'s social teaching in the strongest light. R. early embraced Pre-Raphaelitism, and in letters to the *Times*, his pamphlet entitled *Pre-Raphaelitism* (1850), and his *Notes on the Academy Exhibition* (1850-60), pled its cause. He was appointed Rede Lecturer at Cambridge in 1867, and Slade Professor of Fine Arts at Oxford in 1870.

As a social reformer R. has attained small success. The dreams of Owen or Fourier do not contradict the teaching of history and of common sense so manifestly as the doctrines of R. on political and social economy. *Fors Clavigera*, a series of letters to working men begun in 1871, is read only by the cultivated; and by these, not for the arguments it contains, but for the beauty of its language. The Society of St. George, founded by Mr. R. about 1870, is an Arcadian republic, delightful to contemplate, wherein man lives contentedly by the sweat of his brow alone, no steam-engine or machine of any kind desecrating nature. R. has devoted a tenth of his remaining fortune to the support of this society, the rules of which form a little gospel. The earnestness and pure benevolence of its founder, however, in a manner hallow even the wildest pages of *Fors*. As an art-critic R. is supreme. Perhaps, like that of the commentators on Shakespeare, his criticism too often becomes creation, taking more from the canvas than the painter dreamt of; but in his spiritualisation of art—his revelations of its true scope—his whole philosophy of æsthetics, he has done more to refine the mind of the world than all the other art-critics of Europe put together. He preaches absolute reverence towards every created thing, declaring that the true end of the artist is, not to paint a picture, but to preserve faithfully a phase of nature. Different as it is in many respects, subtler and more spiritual in some, R.'s influence on the modern English mind may be compared to that of Carlyle. His teaching has the noblest aims, and no man running counter to the doctrines of so many authorities has made fewer enemies. Charlotte Brontë long ago recognised and fitly characterised him as 'the consecrated Priest of the Abstract and Ideal.' A volume of *Selections from the Writings of R.* appeared

in 1871, and a complete edition of his works is being published by G. Allen, Orpington, Kent (10th vol. 1877). A collected edition of R.'s own painfully elaborated drawings was exhibited in conjunction with his magnificent collection of Turners in 1878.

Russell, The House of, even if we reject the pedigree that traces it back to a Hugh de Rozel figuring in the Roll of Battle Abbey, or further still to a 6th c. monarch, Olaf of Rerik, is of a high and ancient lineage. 'Vertue,' says quaint old David Lloyd, 'flowed in every Age of that family, with its honour and worth keeping pace with its Advancements.' The historic founder, Sir Ralph R., held the governorship of Corfe Castle (1221), and among his descendants were Sir William, member for Hampshire in the 1st of Edward II.; Sir John, Speaker of the House of Commons in the 2d and 10th of Henry VI.; and the Sir John, who, 'as it is thought,' slew James IV. at Flodden, and, raised to the peerage as Baron R. of Cheneys (1539), was created first Earl of Bedford (1550), receiving the present family seat of Woburn Abbey, Bedfordshire. His grandson, Sir William R., as Lord-Deputy of Ireland (1594), 'brought Tyrone upon his knees, and Iniskillyn to a surrendry;' and another William, fifth Earl of Bedford (1614-1700), fought for the Parliament at Edgehill, and for the King at Newbury, acquiesced in both Restoration and Revolution, and was created first Duke of Bedford, May 11, 1694.—**William Lord E.**, son of the latter, was born September 26, 1639, and after studying at Cambridge, spent some time on the Continent. Entering Parliament in his twenty-second year, he rose to be head with Cavendish and Coventry of the 'Country' party; and in 1679, when rumours of the Popish Plot were at their height, was returned by two separate counties, 'a fact,' Ranke remarks, 'almost unprecedented in parliamentary history.' Having already intimated that were the Duke of York to ascend the throne men must make up their minds either to turn Papists or be burnt, he brought the Exclusion Bill into the Upper House, November 16, 1680. In 1682, a Whig Society, the 'Southampton,' began to assemble at R.'s country house, holding to the principles of the Bill, but discountenancing rebellion. Meetings, however, did take place, on R.'s own showing, in which an attack upon Whitehall was seriously discussed; and on one occasion, when in presence of him and Monmouth it was proposed to overpower the palace guards, he opposed the plan, saying that it might lead to the slaughter of the guards in cold blood, and 'what an atrocious deed were that.' On the discovery of the Rye-House Plot, from which his own designs for securing the succession of Monmouth were wholly distinct, R. was arrested and brought to trial. He did not deny the fact of the meetings themselves, but represented them as always accidental. Nevertheless, court lawyers skilfully blending the two conspiracies, he was convicted, and, in spite of all his kinsfolk's efforts on his behalf, beheaded in Lincoln's Inn Fields, July 21, 1683, 'dying,' says Ranke, 'for the doctrine of the right of resistance, which to him had become almost a religion.' See Earl R.'s *Life of William Lord R.* (1819; 4th ed. 1853), and vol. v. of Ranke's *History of England, principally in the 17th c.* (Eng. trans. Oxf. 1875). Lord R.'s cousin, Edward R. (born 1651), as Torrington's successor in command of the fleet, overthrew the Jacobite hopes by his signal victory over the French off Cape La Hogue, May 19, 1692, at the very time that he was intriguing with James II. He was raised to the peerage as Earl of Orford in 1697, and died in 1727.—**Lord John R.**, fourth Duke of Bedford, born September 30, 1710, was First Lord of the Admiralty (1744-48), Lord-Lieutenant of Ireland (1756), and President of the Council in Grenville's Ministry (1763), that 'narrow and selfish oligarchy,' as Green terms it, whose greed of power surmounted every other feeling. He died January 15, 1771, and Earl R. has published his *Correspondence* (3 vols. Lond. 1842-46). John R., the sixth Duke (born July 6, 1766; died October 20, 1839), did much for the improvement of agriculture, and rebuilt Covent Garden Market (1830), but only once held office, as Lord-Lieutenant of Ireland (1806-07). He was the father of Earl R. (q. v.), and grandfather of Odo R. (born February 20, 1829), English Ambassador at Berlin since 1871, and third plenipotentiary in the Berlin Congress (1878), whose elder brother, Charles Hastings (born October 16, 1819), succeeded his uncle as ninth Duke of Bedford, May 27, 1872. See Wiffin's *Memoir of the H. of R.*

Russell, John, Earl, third and youngest son of the sixth Duke of Bedford, was born in London, 18th August, 1792. Ill-

health forbade his continuance at Westminster School, and when fifteen he accompanied Lord and Lady Holland on a two years' tour in Spain. This over, he resided some months at Edinburgh with Professor Playfair, attending the lectures of Dugald Stewart and Thomas Brown; and after a second visit to the Peninsula he entered Parliament in July 1813 as member for the 'family borough' of Tavistock. Though destined from infancy for the leadership of the Whigs, in spite of high birth and industry he rose but slowly to the foremost ranks, and during the earlier years of his political career excited little interest by persistent efforts in favour of parliamentary reform, the repeal of the Test and Corporation Acts being his first success (1828). On the fall of the Wellington and formation of the Grey Ministry (1830), R. found himself excluded from the Cabinet, merely receiving the post of Paymaster of the Forces; but by this time he had acquired a kind of vested interest in Reform, and Lords Grey and Durham requested him to prepare a draft Reform Bill. He explained the scope of his proposed measure (1st March, 1831), a measure so sweeping that it took men's breath away, and the Opposition greeted it with shouts of scornful laughter. Not so the nation. 'The Bill, the whole Bill, and nothing but the Bill!' was England's cry; 'hundreds,' says Macaulay, 'waited round our doors till sunrise to hear how we had sped;' and on 4th July 1832 the Reform Act was passed, its author meanwhile, by ripened oratory and the expansion of his intellectual powers, having come to the front among the statesmen of the day. The success of his motion for a Committee to inquire into the Irish Church Establishment (30th March, 1835) led to Peel's resignation and Lord Melbourne's recall to office, and as Home Secretary and leader of the Lower House R. took a chief part in the Municipal Corporations Act (1835), the General Registration Act (1836), and other important measures. Disturbances in Canada induced him to take the post of danger at the Colonial Office (1839); two years later the fall of the Whigs left him head of the Opposition, as member for the city of London, which he represented up to his elevation to the peerage. The history of R.'s next five years is also the history of the Corn Laws (q. v.). His celebrated 'Edinburgh Letter' (1845), calling for total repeal, broke up the already disorganised Peel administration, and R. was called on to form a ministry, but failed to do so owing to Whig dissensions. He was more successful in 1846, when Sir Robert having carried the Repeal and then by a factious attack on his Coercion Bill been driven to resign, the R. ministry succeeded to the difficult task of grappling with Irish agrarian outrages, the famine of 1846, and the political disaffection of '48. Little was accomplished in the way of legislation, the Jewish Disabilities Bill (1848) being thrown out by the Lords, and the Ecclesiastical Titles Act (q. v.) severing Peelites from the Government. Lord Palmerston, dismissed from the Cabinet (1851), within two months, by an amendment to the Militia Bill, defeated his former colleague; and to a short-lived Derby Ministry succeeded the Coalition Government of Aberdeen, where R., waving the premiership, assumed the leadership of the House, and became successively Foreign Secretary and President of the Council. Thenceforth his reputation waned. The quarrel with Palmerston broke out afresh; the Reform Bill of 1854 proved most inopportune; and suddenly, on Roebuck's motion for the Crimean Committee, Lord John resigned (1855). His negotiations at the Vienna Congress also miscarried, and in explanations to the House he was forced to own that he had offered to accept the Austrian compromise, which later he had publicly denounced. In 1857 R. united with Peelites, Conservatives, and Radicals for Palmerston's overthrow, but their efforts proving only temporarily successful, he consented in 1859 to serve once more as Foreign Secretary. His new Reform Bill (1860) was withdrawn without a division, and in June 1861 he was raised to the peerage as Earl R. of Kingston Russell, Dorsetshire, and Viscount Amberley of Amberley, Gloucestershire. In the Upper House his foreign policy was conspicuous for its policy of judicious, if somewhat inglorious, non-intervention, which kept England clear of broils with the United States (1861) and Germany (1864). In 1865 he succeeded Palmerston as Premier, but the unfortunate Reform session of the following year left him, in Gladstone's words, 'no alternative' but resignation, with which act his career as statesman came to a timely close. He died in London, 29th May 1878. R.'s oratory, if mannered and slightly provincial, was clear, incisive, and effective. Honesty was the sterling feature of his character, coldness and self-assertion its

defects. He had a sincere contempt for all dissenters from orthodox Whiggism, was rarely troubled by doubts, and though free from every mean party vice, was led into frequent blunders by his identification of party with national interests. Sydney Smith hit off his 'ignorance of moral fear' in the famous soubriquet, 'Lycurgus of the Lower House'; his obstinacy in the saying, 'The Russells must be trepanned before they can be convinced.' Ambitious of writing as well as making history, R. wielded a pen less ready than productive. Besides blue-books and pamphlets, he published a *Life of Lord William R.* (1819); a tale, *The Nun of Arronca* (1821); an *Essay on the English Government and Constitution* (1822); a five-act tragedy, *Don Carlos* (1822); *Memoir of the Affairs of Europe, 1713-48* (1824); *Establishment of the Turks in Europe* (1828); *Causes of the French Revolution* (1832); *Selections from the Correspondence of John, Fourth Duke of Bedford* (3 vols. 1843-46); *Memoir and Correspondence of Moore*, and of *Fox* (both in 4 vols. 1853); selections from his own correspondence and despatches (2 vols. 1870); *Essays on the Rise and Progress of the Christian Religion in the West of Europe* (1873); and *Recollections and Suggestions* (1875).—**John, Viscount Amberley**, Earl R.'s eldest son, was born 10th December 1842. From Harrow he proceeded to Edinburgh, and thence to Trinity College, Cambridge, contested Leeds unsuccessfully (1865), but sat for Nottingham (1866-68). He was a frequent contributor to the *North British*, *Fortnightly*, and *Theological Reviews*, and had for some years been occupied on a crude, daring *Analysis of Religious Belief* (2 vols., 1876), when he died at Ravenscroft, near Chepstow, 8th January 1876.

Russia, the largest empire in the world, and after China and the British Empire, the most populous, embraces over one-half of Europe and nearly one-third of Asia, or more than one-sixth of the land-surface of the globe. It is as remarkable for compactness as the British Empire is for the world-wide dispersion of its parts. Alaska (q. v.), the only out-lying portion of R., was purchased by the United States in 1867. The population of R. is remarkably small in proportion to its enormous area. European R., which is five and a half times more populous than the Asiatic part, ranks, with the exception of Sweden and Norway, as the least densely peopled state in Europe. It has only 34 inhabitants to the sq. mile, as against 469 in Belgium, 389 in England and Wales, 238 in Italy, and 201 in Germany. The component parts of the empire, and the distribution of the inhabitants, are shown in the following table for 1870-76:—

	Area. Sq. miles.	Population.
Russia (European),	1,999,715	65,704,559 (1870)
Kingdom of Poland,	47,101	6,528,018 (1872)
Grand-Duchy of Finland,	140,000	1,912,647 (1875)
Lieutenancy of the Caucasus,	7,938	5,391,744 (1871-76)
Siberia,	4,824,408	3,440,362 (1873)
Central Asia,	1,104,830	4,490,213 (1870)
	8,323,992	87,467,543

Boundaries.—In the N. the empire is bounded by the Arctic Ocean, in the E. by Behring Strait and the Seas of Kamchatka and Okhotsk (large inlets of the Pacific), and in the W. by Sweden, the Baltic, Prussia, Austro-Hungary, and Rumania (q. v.). The southern frontier has undergone much rectification in recent years. Starting in the extreme E. from the coast to the S. of Vladivostock, near the Corea, the boundary-line follows the Usuri and the Amoor (q. v.), which separate R. from Manchuria. It is then formed by the Altai Mountains, and is carried S.W. by the Thian-Shan Mountains into Turkestan, where it passes in a wavy line from the upper course of the Sir Daria to the delta of the Amu Daria in the Sea of Aral. Within it are now included almost the whole basin of the Sir Daria, with the towns of Tashkent, Khojend, and Samarcand, and the Khanate of Khokan (since 1875), and part of Bokhara. Russian power is supreme in Central Asia, and is maintained by a line of forts on the Sir Daria, and by the presence of a strong body of troops under General Kaufmann. Khiva and Bokhara are actually Russian dependencies. From the Sea of Aral, the frontier of R. is carried S.E. across the Ust-Urt plateau to the river Atrak, and then W. to the Caspian. The Atrak separates R. for some 50 miles from Persia, which surrounds the S. shore of the Caspian, and again touches Russian territory at Astara, in the extreme S.E. of Trans-Caucasia. Hence the Aras river divides R. from Persia

W. as far as Mount Ararat, from which point Trans-Caucasia is separated from Turkey in Asia by a line fixed by the Berlin Congress Treaty (July 1878). It includes the ceded districts of Ardahan, Kars, and Batoum, and terminates at Makrialos, on the Black Sea. With the Black Sea begins the old boundary of R., the only other important modification of which was effected in Bessarabia by the Berlin Congress, which extended Russian territory S. along the Black Sea to the Kilia mouth of the Danube.

Seaboard and Islands.—While the rest of Europe has about 19,500 miles of coast, R. with a greater area has only 5518 miles. The Arctic seaboard is rendered comparatively profitless by the severity of the climate. Beyond the Kara Sea drifting fields and bergs of ice oppose terrible obstacles to navigation even in summer. The chief islands are Novaya Zemlia (q. v.), Kolgoniev, Vaygatz, and White Island, Spitzbergen (q. v.), the Toumatsk group (comprising six large islands) at the mouth of the Lena, and New Siberia or Liakhov Islands. In the E. the vast Sea of Okhotsk penetrates so far inland as almost to convert the eastern part of Siberia into a peninsula. It is confined on the N. by the volcanic promontory of Kamtchatka, from the extremity of which the Kurile Islands stretch in a chain towards the Japanese archipelago. In 1875 R. gave up the Little Kuriles to Japan in exchange for territory in Sakhalin (q. v.). Of the inland seas of R. by far the most important is the Caspian (q. v.); the two great marine outlets of Russian commerce are the Black Sea (q. v.) and the Baltic (q. v.). The Sea of Azov, the shallowest of seas, has a depth of only 43 feet. In the Baltic the Russian islands of Aland (q. v.), Osel, and Dago, besides several of smaller size.

Divisions.—Finland, Poland, and the Caucasus are in strict sense rather Russian possessions than integral parts of the empire. For administrative purposes, R. is divided into fifty governments, the areas and populations of which are as follows, according to the *Almanach de Gotha* of 1878:—

Governments.	Area in sq. miles.	Population.
Archangel	131,503	281,112
Astrakhan	86,688	601,514
Bessarabia	13,473	1,078,932
Courland	19,550	619,154
Don Cossack Territory	61,911	1,086,264
Ekatereinoslav	26,037	1,354,300
Estonia	7,610	323,961
Grodno	14,700	1,008,521
Jaroslav	122,988	1,000,748
Kaluga	11,934	906,252
Kazan	24,600	1,704,624
Kharkov	20,737	1,698,015
Kherson	27,407	1,596,809
Kiev	19,687	2,175,132
Kostroma	32,701	1,176,097
Kovno	15,775	1,156,041
Kursk	17,937	1,454,807
Livonia	18,150	1,000,876
Minsk	35,254	1,182,230
Mohilev	22,700	947,625
Moscow	12,522	1,772,624
Nijni-Novgorod	19,390	1,271,564
Novgorod	47,213	1,011,445
Olonetz	59,567	296,392
Orel	18,040	1,596,881
Orenburg	73,890	900,547
Penza	14,826	1,173,186
Perm	128,245	2,198,666
Podolsk	16,221	1,933,188
Poltava	10,261	2,102,614
Pskov	17,069	775,701
Riazan	16,250	1,477,433
St. Petersburg	17,065	1,325,471
Samara	60,207	1,837,081
Saratov	32,614	1,751,268
Simbirsk	19,108	1,205,881
Smolensk	21,637	1,140,015
Tambov	25,663	2,150,971
Tamuda	24,537	704,997
Tchernigov	20,231	1,059,600
Tula	11,955	1,167,878
Tver	25,223	1,528,881
Ufa	47,031	1,364,925
Viatka	59,114	2,406,024
Vilna	16,411	1,001,909
Vitebsk	17,438	888,727
Vladimir	18,862	1,259,923
Volhynia	27,738	1,704,018
Vologda	155,498	1,003,039
Voronej	25,437	2,152,666
	1,999,715	65,704,559

For detailed statistics regarding the Caucasus, Finland, Poland, and Siberia, see the special articles under these heads. The divisions, &c. of Central Asia are as follows, according to the *St. Petersburg Calendar* for 1876:—

Governments.	Area in sq. miles.	Population.
Akmollinsk	210,565	381,900
Amu-Daria	39,977	109,585
Ferghana	28,045	800,000
Kuldja	27,496	114,317
Sarefshan	19,665	271,000
Semipalatinsk	188,298	510,163
Semiretchensk	155,297	543,094
Sir-Daria	166,003	848,489
Trans-Caspian Territory	126,283	275,000
Turgai	201,727	289,930
Uralsk	141,474	346,715
	1,304,830	1,499,213

Physical Aspect.—The interior mass of European R. belongs to the great European plain, and presents certain strongly-marked peculiarities. All the rivers, for instance, with the exception of those which fall into the Arctic Ocean, are received by inland seas, and are singularly tranquil in their course. The distance from the ocean gives to the climate the peculiar 'continental' characteristic of severe alternations. The water-system is so linked together, that not only all the large rivers, but all the seas into which Russian rivers flow communicate with each other. The country, indeed, consists of two halves, widely differing in character. 'The northern half is a land of forest and morass, plentifully supplied with water in the form of rivers, lakes, and marshes, and broken up by numerous patches of cultivation. The southern half is, as it were, the other side of the pattern—an immense expanse of rich arable land, broken up by occasional patches of sand or forest' (*Wallace*). The Black Earth Zone (*Tchernoziom*) extends from the Pruth to the Urals, and from the Oka to the Black Sea (excepting the sterile Crimea) and Caucasus. Its area is about 230,000 sq. miles, and the deep loamy soil is of inexhaustible fertility, producing, without manure, the richest crops. The grain-bearing surface is equal in extent to France, while the population, as yet only 25,000,000, is being augmented every day. From the earliest times this has been the granary of Eastern Europe; it is the home of the labouring Scythians of Herodotus, and the source from which Athens drew its supply of cereals. To the S.E. lies the region of the arable steppes, a fertile treeless plain resembling the American prairies. In spring an ocean of verdure, in autumn a reddish, burning plain, the country of the Cossacks passes imperceptibly into the dry, inhospitable steppes of the Kirghis and the Kalmucks. The key to the geography of R. is the group of the Valdai Hills, midway between Moscow and St. Petersburg. They are only 1200 feet above the level of the sea, and not more than half as much above the surrounding country, but they form the watershed of R., together with the woody undulating plateau of Alaoune, which extends E. to the Urals. The longest rivers flow S., and of these the chief are 'la mère' Volga (the longest in Europe, 2400 miles), and the Ural, which enter the Caspian, and the Don, Dnieper, Dniester, and Pruth, which fall into the Black Sea. The Onega, N. Dwina, Mezen, and Petchora, the second class in respect of length, flow N. to the Arctic Ocean and the White Sea, while the Baltic receives the Neva, S. Dwina, Niemen, and Vistula. In the N. the surface is in great part covered with frozen swamps, where all vegetation ceases. Salt marshes extend up the Volga to Saratov; the waters of Lake Elton in Astrakhan contain more saline matter than those of the Dead Sea. The surface of Cis-Caucasia lies below the sea-level, and in times of flood a boat can pass from the Don by its Manytch affluent and the salt marshes beyond into the Caspian Kuma. R. is separated on the E. from Siberia by the Urals (q. v.), the longest range parallel with the meridian of longitude in Europe or Asia. The Caucasus (q. v.), the loftiest mountains of Europe, extending across the isthmus between the Caspian and Black Sea, may be said to form a south-eastern boundary. The isthmus of Russian Lapland is a granite plateau, about 500 feet high, perfectly riddled with lakes, of which two outlying ones, Ladoga and Onega, are the largest in Europe. For the geography of Asiatic R., see ASIA, SIBERIA, &c.

Climate.—The extremes of temperature are greater in R. than

in any other country of Europe or Asia. The N. differs from the S. not so much in the degrees of cold and heat as in the duration of the seasons. In the N. of European R. the White Sea is icebound from July till winter, and a large part of the seaboard is constantly frozen, despite the continuous presence of the sun annually for many weeks. Yet Lapland is infested with mosquitoes in summer, and the heat of its nightless days is almost intolerable. In winter the rivers of R. are sledge-ways. Spring, with its thaws, is known as the 'season of bad roads' (*raspoutitsa*). According to M. Leroy-Beaulieu, the country to the N. of the Black Sea and Caspian, under the latitude of Paris and Venice, has in January the temperature of Stockholm, and in July that of Madeira. Along the Sea of Aral the extremes of temperature attain their maximum. Although the Bay of Odessa is annually frozen, the S. shore of the Crimea produces the orange, fig, almond, and pomegranate. Swept by the frozen winds of the Arctic, the plain of R. lies too far inland to catch the genial sea-breezes that fertilise Western Europe. The shores of the Baltic have a rainfall of 20 inches, while those of the Caspian have only 4 inches. The climate of R. is singularly healthy. There are a few endemics, such as scurvy, along the Arctic shores, *plica polonica* among the marshes of the Niemen and Vistula, and ague in the vicinity of the Caspian and Black Sea, while frost-bite is not unfrequently a cause of death.

Botany and Agriculture.—Forests cover some two-fifths of the European part of the empire. To the N. of the Valdai Mountains pine, Scotch fir, spruce, and other coniferæ prevail, and further S. there are immense tracts of oak, beech, birch, maple, ash, lime, &c. According to a report of 1878, the forests of R. cover 483,860,263 acres. Of these, 302,417,160 acres belong to and are directly administered by the Crown; 14,732,208 are attached to the Crown mines and factories; 14,987,570 belong to Crown appanages; 151,723,385 are shared between village communes, churches, and private individuals. The scarcity of building stone and coal gives wood in R. an unusual economic value. Formerly the large churches and palaces, and even the fortifications, were constructed of this material, as are the houses of the middle class and the *izbas* of the peasantry at the present day. The value of the timber used in R. amounted to £43,135,630, and of that exported to £2,645,500 in 1878. In 1877 R. exported 188,625,000 bushels of cereals. In 1872 the total yield of wheat was 157,938,000 bushels (value £6,660,616), and of buckwheat 86,256,000. Further S. maize and millet are brought to perfection, while immense quantities of hemp (14,410,000 bushels of seed and 1,934,888 cwts. of fibre in 1872) and flax (47,292,000 bushels of seed and 4,837,219 cwts. of fibre) are grown all over the country. But the grain most widely cultivated is rye (546,832,000 bushels in 1872), which in the form of black bread is the principal food of the peasantry. Other products are oats (543,622,750 bushels), barley (124,753,750), rape, hops, tobacco (80,001,148 lbs.), potatoes (370,876,000 bushels), and beetroot (10,545,137 cwts.), the cultivation of which is steadily increasing. In Bessarabia and the Crimea the vine is cultivated, and the annual yield is about 54,000,000 gallons of good wine. Around the Black Sea grow southern fruits, the mulberry, &c., and in Transcaucasia, rice, cotton, madder, melons, and even the sugar-cane.

About one-half of the arable land belongs to the State, and peasants living on this land are governed by a special branch of the administration. A considerable part belongs to rich nobles, who leave the management to a steward or to the peasants themselves, banded in village communes. These communes can work profitably where single proprietors would suffer loss. The land is mostly cultivated under the 'three-field system,' in which a third of the soil is always lying fallow, to be used in summer as pasturage. The Bashkirs, who find their territory contracted by the advance of Ural Cossacks on the E. and the ever-advancing wave of Russian colonisation in the W. and N., present the interesting spectacle of a transition from pastoral to agricultural life.

Zoology and Live Stock.—Of the wild animals a large proportion are fur-bearing. Of these the chief are the bear, ermine, sable, deer, fox, marten, and badger, found in the N., while other wild animals widely distributed are the elk, wolf, glutton, auroch, boar, otter, polecat, squirrel, marmot, and hare. The white bear seldom passes the line of perpetual snow; the bison is found near the sources of the Narev. In 1872 the furs exported amounted in value to £520,000. Reindeers are

largely bred in the N.; camels and buffaloes in the southern steppes; and dromedaries in the Crimea. On the N. coast are found the seal, the walrus, the eider duck, and other wild-fowl. Cattle-rearing is extensively carried on in the S. and W. provinces. In 1874 R. had 28,500,000 head of horned cattle, and in 1875 exported 748,976 head of live stock (except horses), value £1,523,847, and hides to the value of £466,215. The horses are, of a good breed, and the export (to Germany and Austria) numbered 33,343, value £334,580, in 1875. Of sheep (64,500,000 in 1874) there are several breeds. In the Lithuanian oak forests are immense herds of swine, of which R. had 11,000,000 in 1874. In 1875 the export of tallow amounted to £312,672, and of hogs' bristles to £694,088. Bee culture is general in Poland and on the Volga; the yearly yield of wax is 7,000,000 lbs., and of honey 21,000,000 lbs. The fisheries are a very important source of revenue. Cod and herring are caught in the White Sea, mackerel, sardine, &c., off the Crimean coast, sturgeon in the Caspian, salmon, trout, &c., in the rivers and lakes. The value of the Caviare (q. v.) exported in 1875 was £166,724.

Geology and Mineralogy.—The heart of European R. is occupied by the Permian system, so named by Murchison on account of its development in Perm, which extends beyond the Urals. This vast tract is enclosed by two extensive branches of the Devonian strata, extending from the Gulf of Finland, the one reaching N.E. to Archangel, the other S.E. to Veronej on the Don. To the S. of the latter branch are cretaceous deposits and carboniferous patches. The Silurian, along the S. of the Gulf of Finland, are the oldest stratified rocks in R. The whole of Finland may be said to be formed of granite, which also crops out in the middle course of the Dnieper. The Urals present most of the Secondary and Palæozoic formations down to stratified gneiss, while the S. part of the empire is mainly covered with Tertiary beds. In R. the carboniferous formation contains only the members of the group up to mountain limestone, in which occur many thin seams of coal, usually of poor quality. The field in the basin of the Donetz, an affluent of the Don, which is exceptionally rich, produced 660,000 tons of excellent coal and anthracite in 1873. The total output of coal in R. in 1872 was 1,097,832 tons, while the coal imported was 1,520,278 tons in 1875 (value £1,380,645). Perm and Orenberg, which both stretch across the Urals into Asia, are singularly rich in minerals. The production of iron (8 million cwt. in 1874) is less even than that of Belgium and Austria. The Urals are the centre of the iron industry, but there are mines in Minsk, Volhynia, and Finland. In 1870-74 the total product of gold in R. (chiefly in the Urals and Altai) was 720 cwt. (value £5,000,000), and of silver 266 cwt. Nijni-Tagilsk is the only district in Europe where platinum is found, the yield amounting to 24 cwt. yearly. Other important minerals are copper, lead, zinc, tin, quicksilver, sulphur, arsenic, nitre, gypsum, and lignite. Salt (538,800 tons) is obtained from the lakes in the S., and from the vast rock-deposits at Iletzk (q. v.). Naphtha is found in the Caucasus, amber in Poland and Lithuania, and small diamonds and other precious stones in the Urals.

Industries.—The native industries are protected by the imposition of a heavy tariff on foreign manufactures. The principal manufactures are cottons and woollens. Peter the Great, who may be said to have started R. in the industrial race, founded 21 large and several small factories. In 1820 the number had risen to 3724, in 1854 to 18,000, and in 1870 to 19,431, employing 410,225 workmen, and producing goods to the yearly value of £6,000,000. The import of raw cotton in 1875 was 79,783 tons (value £8,322,314), and the cotton goods produced in that year by 1508 factories were valued at £35,000,000. In the same year 1831 woollen factories, employing 105,135 hands, produced £10,000,000 worth of goods. The silk industry has suffered recently from disease among the silkworms, and from the emigration of the Mennonites, but there are still 518 factories, with 12,000 hands. In 1874 R. had 3600 breweries (778 in Poland), and 325 beet-sugar factories. In 1873 there were 202 iron foundries, and 150 blast-furnaces, the product in 1875 being 420,484 tons of pig-iron and castings, 299,032 tons of finished iron, and 12,730 of steel. One of the specialties of R. is its unrivalled leather (russia and morocco) for bookbinding. Nijni-Novgorod and Tula have important manufactures of fire-arms and cutlery. Other notable products are sailcloth, ropes, malachite wares, ornamental glass, shagreen, caviare, and pottery.

Commerce, Railways, &c.—The commerce of R. is mainly internal, and is largely transacted at the great fairs of Nijni-Novgorod (q. v.), Berditchev, Kursk, and Lublin. The barter of its widely varied products renders it less dependent than perhaps any other country on foreign commerce. The internal trade is in great part conducted by the rivers and canals, and in Asia by caravans. The railways, begun in 1838, are rapidly increasing; the total length of lines in 1860 was 634 miles; and in December 1877, 17,685 miles. The principal ports are St. Petersburg, Riga, Odessa, Sebastopol (since 1875), Astrakhan, and Archangel. In 1877 the total exports (wheat, rye, oats, barley, flour, groats, pease, flax, tow, linseed, wood, hemp, raw wool, horses and other animals, brandy and corn spirit, leather, unwrought metals, seed oil, yarn, butter, &c.) amounted to £72,600,000; the imports (raw cotton, cotton yarn, raw wool, engines and machinery, wrought iron, metal wares, rails, tea, chemicals, woollens, wine, &c.) to £52,000,000, and the customs' revenue to £7,885,089. In 1877 Great Britain sent to R. merchandise to the value of £6,243,973, and Germany (in 1875) to £17,400,000; the former country received of the exports £22,142,422 (northern ports £18,925,959), the latter £35,983,512. The merchant fleet in 1874 numbered 2504 vessels of 520,584 tons; besides 385 steamers on the rivers and lakes. There were 50,686 miles of telegraph lines in R. in 1874. In 1875 a scheme was sanctioned for the construction of 4400 miles of railway in Siberia and the Don valley. The continuation of the Orenburg line into Central Asia has been condemned on account of the inhospitable nature of the country.

Ethnology.—According to an elaborate series of papers (with maps) in the late Dr. Petermann's *Mittheilungen* for 1877-78, there are 58,049,395 Slavs and 12,421,087 non-Slavs. They are distributed as follows:—of Slavic race, Great Russians 34,389,871, Little Russians 14,201,279, White Russians 3,592,057, Poles 4,764,713, Bulgarians 93,685, Czechs 77,901; of races allied to the Slavs, Lithuanians 811,051, Schmdches 623,700, Letts 1,047,929. To the Greco-Latin group belong 77,132 Greeks, 648,464 Rumanians, and 1036 French; to the Germanic group, 985,689 Germans (188 English), and 273,021 Swedes; and to the Iranic group, 342,000 Armenians, and 111,654 Gypsies. The Semitic stem is represented by 2,552,145 Jews. The Turanian race is divided into the Finnish and Tartar groups. The first comprises the Karelic and Tchudic people, the Volga-Finns, and the North Finns, amounting to 3,068,456; the latter, the Tartars proper, Bashkirs, Tepjares, Tchuvashes, Kirghis, and Kalmucks, amounting to 4,270,476. It is the object of the government to assimilate the language, religion, &c., of all parts of the empire to those of Great R. The recent efforts to Russianise the Poles and non-Slavic nations have been so tyrannical as almost to defeat their purpose. The pure Slav dialect of Little R. is also banished from churches and schools. Between 1872 and 1876, 32,461 Russian emigrants embarked at Hamburg. See POLAND and MENNONITES.

Classes.—According to official statistics (Livron) for 1875, R. has 652,887 hereditary nobles, 374,367 personal nobles, 695,905 clergy, 7,196,005 town people, 63,840,291 country people, 4,767,703 military, and 153,135 foreigners. Mr. Wallace estimates the merchant class at 446,000, the burghers at 4,033,000, and artisans at 260,000. Titled families are numerous, and all the children bear the titles of the parents even while the parents are alive. There are hundreds of princes and princesses who have no right to appear at Court, and would not be admitted to refined society in any country. *Tchin* or rank, military or official, plays an important part in social life. The *Mir*, or village commune, one of the most singular institutions of R., is a pure democracy for the management of village affairs, and has arbitrary control over its members. It is responsible for the taxes, and in the event of insolvency, cannot be deprived of its land by creditors. Supplementing the action of the *Mir* is the *Zemstvo*, an institution created ten years ago, to lighten the duties and correct the abuses of the administration by means of local self-government. It is composed partly of nobles, partly of peasants, and there is no trace of antagonism between these classes. The nobles have adopted French fashions, and speak French with perfect accent; the lower classes, nonchalant and pleasure-loving, indulge excessively in gambling and vodka-drinking.

Religion and Education.—For the doctrine of the Russian Church, see GREEK CHURCH. In 1876 the Greek Church of

R. possessed 38,602 churches (including 59 cathedrals), 12,860 chapels and oratories, 62 archbishops and bishops, 98,887 archpriests, priests, and deacons, and 56,500,000 members. There are also 385 monasteries, with 5750 monks, and 154 nunneries, with 3226 nuns; these have an income of about a million sterling, and possess funded property and treasures of bullion and gems estimated at many millions. The grant to the Holy Synod was 9,615,425 rubles in 1876. For an account of the dissenting sects see RASKOLNIKI. In 1873 the number of Roman Catholics (mostly in Poland) was 7,495,000; of Protestants (Baltic provinces) 4,530,000; of Armenian Gregorians 39,000; of Jews 2,760,000; of Mahomedans 2,760,000; heathen 258,000. Roman Catholics and Protestant have civil rights equal to those of the orthodox Greek Catholics. The Greek Church holds the sole right to proselytise, and claims all the children of mixed marriages. The bishops are always taken from among the monks or 'Black clergy'; the 'White clergy,' or parish priests, are in great part drunken and illiterate. Of late years the caste barriers have been removed, and hundreds of 'propouitches' or priests' sons are making their way in secular lines. The Russian peasant has unbounded and childlike confidence in Church rites, and in the efficacy of the Icons, or holy pictures. A 'miraculous Icon' is a thing to be worshipped in itself, because it is capable of conferring temporal fortune, warding off evil, and curing disease. But the 'Molkani' and 'Standisti,' the Protestants of R., intelligently study the Bible, and sincerely regulate their lives thereby. How little diffused instruction is appears from the fact that, in 1870, only eleven out of every hundred recruits could read or write. The experiment of compulsion has been made in St. Petersburg since 1875. In 1875 R. proper had 22,768 public elementary schools, with 942,487 pupils—14 to the 1000 inhabitants, as against 150 in Germany. There are also 133 gymnasia (with 40,000 pupils), 42 pro-gymnasia, 45 real-schools, and 50 training-schools for teachers, besides several higher institutions for engineering, architecture, mining, &c. R. has 8 universities, with (1875) 569 instructors and 6408 students. At none of these is there a faculty of Greek theology, which is taught in 5 church seminaries. R. is amply provided with the apparatus of the highest culture in its magnificent libraries, art galleries, and theatres. There are 117 Russian journals, 30 German, 20 Finnish, &c.

New Law-Courts and Secret Societies.—The old system of legalised injustice, in which the tribunals had become 'dens of pettifogging rascality,' was in great part swept away with the institution of serfdom. The chief reforms were (1) the complete separation of the judicial system from all other branches of the administration; (2) the introduction of publicity, with trial by jury, in criminal cases; (3) the creation of justice of peace courts for petty affairs; (4) the simplification of procedure in ordinary courts. The judges are not always profound jurists, but 'are at least honest, educated men, generally having a fair knowledge of law,' (Wallace). The barristers, an entirely new class in R., not only sell their service as dear as possible, but even use dishonest means of raising the price. There is reason to believe that the empire contains within it ill-regulated desires and forces, which may lead to political convulsions. Erckhardt asserts that revolutionary ideas are spreading fast among all classes. The most formidable society is that of Nihilists, which aims not only at the life of despotism, but at the subversion of society. Odessa is a great centre of Nihilism, and on account of the threatening aspect of affairs there, nearly all the authorities were removed (October 1878), and 400 picked soldiers despatched to reinforce the police.

Army and Navy.—Having already the power to place over a million men in the field, this force was augmented by another half million by the grand measure of universal conscription, sanctioned by the ukase of 1875. With a few stated exceptions, all are liable at the age of twenty-one, and the period of service is fifteen years—six in the active army and nine in the reserve; in Asiatic R. the period is ten years, and the Cossacks serve twenty years. In 1877 the regular army, under the war levy, consisted of 1036 battalions, of 1,626,780 men and 44,894 officers (besides 169,080 non-combatants), with 3004 guns and 217,760 horses. In time of peace the total numbers are 662,073 men, 97,380 non-combatants, and 28,645 officers. The irregular army, including the Cossacks, numbers, in time of war, 131,290 men and 3505 officers, with 726 guns and 120,999 horses. In 1875 the army grant amounted to 181,532,505 rubles. In 1876 the fleet in the

Baltic comprised 71 vessels (and 66 transports) of 143,004 tons, with 374 guns; and that in the Black Sea, 31 of 31,336 tons and 85 guns. There were also squadrons in the Caspian, the Sea of Aral, in Siberia, and in the White Sea. In 1878 over 100 torpedo vessels were constructed, and the fleet was further augmented by the addition of 13 rapid cruisers and 3 new ironclad frigates (among them the *Duke of Edinburgh*).

Government and Finance.—The government is a pure despotism, and the Emperor, the 'autocratic monarch,' is the source of all power and authority. Immediately below him are the Council of State, the Committee of Ministers, and the Senate. The Council has merely a consultative character; the ministers are individually responsible to the Emperor. The Senate is now little more than a supreme court of appeal. A committee was appointed (October 1878) to devise a scheme for the convention of a deliberative parliamentary assembly. The whole empire suffers under excessive centralisation, although 'the jobbery, venality, and extortion of the officials' used to be far worse than they are now. For 1877 the budget estimate of revenue was 570,777,802 roubles, and the expenditure 570,769,280 roubles. The chief items of revenue are indirect and direct taxes and customs; and of expenditure, public debt, army, and ministry of finance. The poll-tax and land-tax amount to £15,000,000 sterling, the excise on spirits to £25,000,000, and the bulk of these are paid by the peasants, who are perhaps more heavily taxed than any other in the world. R. is burdened with a debt of £300,000,000 sterling, bearing interest at 5 per cent., two-thirds of which are held abroad. During the war of 1877 a foreign loan of £15,000,000 was negotiated, and new paper money was issued to the amount of nearly £40,000,000. The *Statist* (Oct. 1878) speaks of a new loan as probable.

History.—Some ten centuries ago the greater part of what is now called R. was occupied by the nomads of non-Aryan, chiefly of Ugrian, race. To the S.W. and W. dwelt Slavs, the easterly flank of that great Slavic wave of population which then occupied a large portion of Europe, and which is now chiefly represented by the Poles, Bohemians, and Croats in the W., and the Russians, Servians, and Bulgarians in the E. According to the oldest chronicle, the Novgorodian Slavs in the N. sent legates 'beyond the sea' to the head of the 'Variag tribe called Rūs,' saying, 'Our land is great and fruitful, but there is no order in it; come and reign and rule over us.' Three brothers accepted this invitation, and appeared with armed followers. The eldest, Rurik (q. v.), settled in Novgorod; the second, Sineus (Sindf), at Byelo-ozero; and the third, Truvor, in Isborsk. This legend has given rise to a vast amount of learned controversy. The extreme Russian patriots hold that these armed men of Rus were Slavs from the Baltic shores, but the commonly-received opinion accepted by the Slavophiles is that they were Northmen from Scandinavia. 'Whether they really came on invitation may be doubted,' says Mr. Wallace, 'but that they adopted the language, religion, and customs of their adopted country does not militate against the assertion that they were Normans.' From the appearance of the new-comers dates the great historical expansion of the Russo-Slavs. To the N., E., and S. new principalities were formed and governed by men who all claimed to be descended from Rurik, and down to the end of the 16th c. no one outside the great family attempted to establish independent sovereignty in R. The seat of government was transferred by Rurik's successor, Oleg (879-912), to Kiev, and there Christianity was first imposed on the Russians by the Grand Prince Vladimir in 988. Vladimir, the apostle (*Isapostolos*) of R., is immortalised in popular song as a pagan hero, little inferior to the gods whom he overthrew. The typical warrior of the period, he extended R. from Lake Ilmen S. to the falls of the Dnieper, and from the Vistula E. to the basin of the Don. Descending on Taurida, he took Chersonesos, and demanded of the Byzantine emperors, Basil and Constantine, the hand of their sister Anne, which he received on becoming a Christian. And so R. was Christianised in turn, just 124 years after the Bulgarians, the first among the Eastern Slavs to renounce heathenism. Vladimir divided R. between his sons and nephews, and after much fighting, Jaroslav, who had originally received Novgorod, made himself master of the whole kingdom in 1036. He resembles Karl the Great in his skillful generalship, but still more by his love of letters in a barbarous age. Bent on the improvement of his subjects, he founded schools, promoted trade, and compiled the *Runkaia Pravda*, the first Russian law code. On his death in 1054 ensued the

long, dreary period of the quarrels of the appanaged princes. At this time Kiev was the greatest city in R., and was worthy of the honour. Like Byzantium, it had a richly-decorated cathedral of St. Sophia, and a Golden Gate, and its monastery of the Catacombs was visited yearly by thousands of pilgrims. Jaroslav girdled it with stout ramparts, and the Dnieper brought the merchandise of the world to its feet. In the N., the city of Novgorod was growing in strength and riches. Later it became an outpost of the Hanseatic League, and proudly styled itself 'Lord Novgorod the Great.' It is distinguished particularly by its republican constitution, the princes possessing merely such authority as was granted by the people. Meantime the descendants of Rurik, each with his following of Bojars (q. v.), or large landed proprietors, continued to quarrel among themselves, and incessant civil strife left the country powerless before the wave of Mongol invasion that swept over it three times between 1223 and 1240. Having advanced victoriously through Poland, Hungary, Bulgaria, Servia, and Dalmatia, the terrible hordes retreated to the Lower Volga, and thither the Russian princes were summoned to do homage to the victorious Khan. Here was formed the state commonly known as Kiptchak (q. v.) or the Golden Horde, the capital of which, Serai, on one of the arms of the Lower Volga, was, when visited by John Batuta in the 13th c., a populous and beautiful city. No attempt was made to Tartarise R., but for over two centuries it lay prostrate under the Mongol yoke, its realm a dependent province, its princes humble vassals who held their rank by the grace of an Asiatic despot. In course of time mutual distrust lessened; the 'godless Tartars' more than tolerated Christianity, for a bishopric was founded in Serai in 1261, a member of the Khan's family founded a monastery and became a saint of the Russian Church, and the orthodox clergy were exempted from the poll-tax. But the Tartars later on adopted Islam, and this raised an impassable barrier between the two nationalities. The princes, despairing of liberty, adopted a policy of conciliation, and in return were made the Khan's lieutenants and collected his tribute. The shrewd, ambitious, unscrupulous princes of Moscow outbid all rivals, and their city sprang into life while Kiev lay in ruins. They lived parsimoniously at home that they might lavish their savings on the Horde. They were bound to the Khan by matrimonial alliances. When haughty, turbulent Novgorod refused tribute, they quelled the insurrection and punished the leaders. When Tver revolted, they received the principality from the Khan, with 50,000 Tartars to support his authority. But the cunning Muscovite only 'loved the Tartars beyond measure' until their power began to wane. The domination helped to unify the realm and create the autocratic power of the Czars. From the Horde a new court-ceremonial was borrowed; the nobles in approaching their august master prostrated themselves in Oriental fashion. When they incurred his displeasure they were summarily flogged or executed. R. was the first Slavic country to fall under the Tartar yoke, and it was the first to free itself. Under Ivan Kalita (q. v.) the Greek metropolitan removed from Vladimir in 1325 to Moscow, and subsequently Muscovy became the grand-duchy. Dmitri made a brave but premature effort at emancipation in his victory over Khan Manai (1380), but this was followed by the burning of Moscow and a heavy indemnity. In the reign of Vassili I. (1389-1425) R. was invaded by Timur and again by Edijei, and was attacked by the Livonians. At length Ivan III. (q. v.), the wisest of his race, the consolidator of R., found himself strong enough to defy his Oriental suzerain, and with Ahmed Khan's unsuccessful invasion of 1480 the Tartar dominion came to an end. After their conquest the restless Tartars had to be pacified, and what increased the difficulty of this task was that a large section of the Horde, inhabiting the Crimea and the steppe N. of the Black Sea, had escaped conquest by becoming tributaries to the Sultan. These tribes harassed Polish and Russian territory and made Kaffa (Theodosia) the centre of a white-slave trade, which flourished till the final conquest of the Crimea in 1783. The Czars of Muscovy built forts, raised palisades, dug trenches, and kept up a military cordon of Cossacks (q. v.). The genuine free Cossacks lived beyond the frontier on the debatable border-land; the Dnieper, Don, and Volga, and Yaik or Ural were each held by separate communities. The kidnapping of Tartar women introduced a certain admixture of Tartar blood, but the Cossacks were Russians by origin, language, and religion, and regularly received supplies and ammunition from Moscow, as is proved by recently-

published documents. Meantime, having broken the Tartar bond, Ivan turned to the provinces of St. Vladimir, which had been annexed by Lithuania. From the time that Jagellon, Grand Duke of Lithuania, married Hedwiga, Queen of Poland, in 1386, and insisted on all his subjects passing into the Roman Church by an unique baptismal ceremony—arranging them in groups, and calling one group 'Peter,' another 'Paul,' and so on—strife between R. and Poland was inevitable. But little came of the present campaign, and the Popes strained their power to effect a formal union of the two churches. Paul II. negotiated the marriage of Ivan with Sophia Palæologus (1472), hoping thereby to get a footing in R. His means, however, were badly chosen, for henceforth Ivan assumed the two-headed eagle, and regarded himself as the heir of Byzantium. To R. Byzantium had all along been the representative of civilisation; hence they drew their religious creed, their military code, their civil polity, their artistic and literary tastes, their choicest merchandise. And when the august city fell to the Turks in 1453, the prince of Moscow, the pioneer of Slavic emancipation, took up, by a bold political fiction, the succession of the empire. To the present day this idea dwells in the minds of prince and people, and that the sympathy with the Christians in Turkey is more than a philological sentiment has been demonstrated by the events of 1877. Ivan deserved the epithet 'Great,' if only for the material benefits he conferred on R., and the architectural monuments with which he adorned its cities. It was he who first assumed the title of 'Czar (Cæsar) of all the Russias,' which gave place officially in Peter's time to that of 'Emperor.' ('Cesarevitch,' i.e., 'Son of the Czar,' is a title only given to the eldest son, who is Crown Prince, *Nashlyednik*, and heir-apparent; his consort is 'Cesarevna.' 'Czarevitch,' on the other hand, only means king's son or prince.) The Reign of Ivan IV. (q. v.), 'The Terrible,' is divided into two periods. The earlier or glorious period, while the Czar was advised by Adachef and Sylvester, saw the conquest of the Khanates of Kazan, Kiptchak, and Astrakhan, the successful invasion of Livonia and Esthonia, and the organisation of the Streltzi (q. v.). The death of his wife Anastasia marks that change in the very character of Ivan which led to the banishment of his two counsellors, the fierce persecution of the Bojars, and cruel massacres in Tver, Novgorod, and Moscow. M. Rambeaud is more lenient in his judgment of Ivan than Karamsin, and is inclined to limit the number and horror of his atrocities, while rating less highly the characters of Adachef and Sylvester. A small body of Cossacks under Emack in this reign annexed to R. the W. part of Siberia (q. v.). Boris Godounof was the virtual ruler during the reign of Feodor (1584-98), the last monarch of Rurik's line. His only brother, Dmitri, died mysteriously in 1591, and suspicion attached to Boris, who had banished him to Uglich, and who now, after the mockery of a convocation, usurped the throne. 'False-Dmitris' sprang up (see DEMETRIUS), and one of these, supported by a Polish army, was crowned in 1605. A period of internal disorder followed, accompanied by famines and plagues. Prince Vassili Shonisky seized the crown in 1606, and held it till the King of Poland, Sigismund Augustus, with the help of the Cossacks, overran Muscovy, and made his own son, Vladislaf, Czar of Moscow, in 1612. This was the signal for the uprising of the orthodox against the Roman Catholic Poles, which ended in the liberation of R., and in the election to the throne in 1613 of the House of Romanoff (q. v.), which has ruled ever since. Michael Feodorovitch (1613-45) restored order and reformed the administration; the reign of Alexei Michaelovitch (1645-76) witnessed the dissemination of the art of printing, and following upon it the revision of the liturgy, psalter, and other religious books by the patriarch Nikon, and the exodus of the Raskolniks (q. v.). Under Feodor Alexievitch (1676-82) R. gained Smolensk and great part of White R. from Poland, and rescued Little R. from the claims of Turkey. The regency of the subtle, energetic Sophia (1682-89), an audacious attempt at usurpation, was followed by the reign of Peter the Great (q. v.), the most remarkable in Russian annals. Thoroughly cosmopolitan in his sympathies, and endowed with courage only equalled by his Titanic energy, Peter modernised R. by a series of gigantic reforms, and by the success of his arms mightily extended her territory. Hitherto R. had belonged to Asia rather than to Europe, and 'was doubtless regarded by Englishmen and Frenchmen pretty much as we nowadays regard Bokhara and Kashgar. Since then

she has formed an integral part of the European political system, and her intellectual history has been but a reflection of that of Western Europe, modified and coloured by national character and local conditions. Utilitarian to the core, Peter raised R. to the level attained by the more advanced nations in material well-being, flooding the country with scientific men and cunning artificers. The nature of Peter's policy is well illustrated in the democratic character he gave to the nobility, and in the liberty he granted, on payment of a double poll-tax, to the dissenters, who regarded him as Antichrist. The reigns of Catharine I. (1725-27) and Peter II. (1727-30) were alike uneventful, but that of Anna (q. v.), Peter's niece, previously Duchess of Kurland, is remarkable as the period when German influence became almost exclusive, and the court, the official world, and the schools, were Germanised. Biron (q. v.), to whom Anna entrusted the whole administration, by his harsh, tyrannical rule brought on a revolution, which raised Elizabeth, Peter's unmarried niece, to the throne in 1741. She tried to rid R. of foreigners, but in displacing the Germans she was only making more easy the entrance of the prevalent Gallomania. During the year-long reign of Peter III. (1762), the obligatory service of the nobility was abolished, and in strict justice the liberation of the serfs should have followed. Peter was assassinated by a court conspiracy, but the truth of this was doubted by the serfs, who hailed the rising of the Cossack pretender, Pugatchef. The revolt of the Cossacks was only quelled (1775) after it had assumed alarming proportions. Meanwhile, Peter was succeeded by his consort, Catharine II. (q. v.), the friend of Voltaire and the Encyclopedists, under whom French influence went far beyond external forms. After the Turkish wars and consequent annexations, South R. was almost uninhabited, and she introduced great numbers of foreign settlers. She removed the disabilities of the Raskolniks, founded educational institutions, built towns, created a *noblesse* on the French model, and tried hard, but failed, to call into existence a rich, intelligent *bourgeoisie*. The most brilliant of her many victories, the conquest of the Crimea (1783), revived the dream of a resuscitated Byzantine Empire. Her violent, eccentric son, Paul I. (q. v.), embittered by the demeanour of his mother's favourites, humiliated the nobles, forbade the introduction of foreign publications, and organised a secret police. After allying himself against France with Austria and Britain, he was on the eve of war with the latter power when his assassination (1801) made way for Alexander I. (q. v.), who early showed great zeal in advancing a grand educational scheme, and in purging the law of its harsher penalties. In the Napoleonic wars he sided with the allies, till compelled by the Treaty of Tilsit (1807) to accede to the policy of France. He wrested Finland from Sweden, and Bessarabia and Moldavia from Turkey; but commercial distress in R. forced him again to change sides, and in rapid succession followed the French invasion of 1812, the destruction of the grand army, and the overthrow of Napoleon. At this time R. stood forth as the liberator of enthralled Europe and the arbiter of her destinies. After the fall of the Napoleonic empire Alexander reverted to a policy of repression, which was carried by Nicholas I. (q. v.) to an extreme; and this opposition to liberalism and progress had its literary counterpart in the nationalistic reaction of the Slavophiles. Successful wars against Persia and Austria added to the territory of R., which was further enlarged by annexation of Poland (q. v.) in 1830. R. aided Austria to quell the Magyars (1849), and fought single-handed against the French, English, and Turks in the Crimean War (1853-56). In spite of the heroic defence of Sebastopol, the campaign resulted only in disaster. But by exposing the incapacity and dishonesty of the military administration, it gave the death-blow to the repressive system of Nicholas, 'the Don Quixote of Autocracy,' and produced an intellectual movement and a moral revival which led to gigantic results. Alexander II., sensible of the spirit of the time, removed the restrictions on the universities and the press, promoted the construction of railways, roads, river-steamers, and on the 31 March 1861 freed the Serfs, 23,000,000 in number. During the Franco-German War, R. suddenly intimated her intention of setting aside the principal condition of the Treaty of Paris, and keeping a fleet of sufficient capacity in the Black Sea. In Central Asia, the policy of pacification by annexation, carried out with singular vigour and ability by Kaufmann (q. v.), had by 1875 extended the frontier as set forth in the paragraph on Boundaries. But attention was suddenly

withdrawn from what appeared a menace against British India by the re-opening of the Eastern Question and a momentous European war (see TURKEY). After the failure of the new Turkish Constitution of 1877 devised by Midhat Pasha, R. initiated the curious diplomatic proceedings resulting in the Protocol of 31st March, by which the Great Powers agreed to see the promised reforms of Turkey carried out. The blunt repudiation of the Protocol by Turkey was followed by a declaration of war by the Czar, 24th April 1877. Lord Derby, in a despatch, censured R. for breaking away from the European concert and forcing on an unnecessary war. The apologetic reply of Prince Gortchakoff protested that R. would respect 'British interests,' which were defined subsequently as the safeguard of Constantinople, Egypt, the Suez Canal, and Persian Gulf. By the 26th June the Russians had found their way into Bulgaria, actually without serious opposition, the crossing of the Danube (begun 21st June) having been effected at Galatz, Braila, and Hirsova on the Dobrudscha, and from Simnitsa to Sistova. Then followed the taking of Tirnova (q. v.) and Nicopolis (q. v.), and, in the third week of July, General Gourko's celebrated march through the Balkans, taking the Shipka Pass (q. v.) in reverse. But with nothing, apparently, to oppose his advance on Adrianople, Gourko had no power, for want of support, to complete his brilliant exploit, and his defeat by Suleiman Pasha (q. v.) at Eski Sagra compelled him to retire into the Balkan passes. In the desperate but futile attempt to take Fort Nicholas, at the summit of the Shipka Pass, Suleiman in a ten days' struggle threw away 20,000 of the best soldiers of the Porte. The unexpected gallantry and obstinacy of the Turks broke in upon the paralysis which for a time seemed to hold both combatants. The prolonged resistance of Plevna (q. v.), ending in the dramatic sortie of Osman Pasha (q. v.), had its counterpart in the brilliant feat of arms by which Kars (q. v.) was captured. The conquest which inevitably followed led to the projection of the Treaty of San Stefano, which at first R. declined to submit to a Congress. This decision was reversed on the representations of Lord Salisbury, the new head of the British Foreign Office, backed by the despatch of an English squadron to the Sea of Marmora. A Congress met at Berlin in June 1878, under the presidency of Prince Bismarck, and a Treaty was concluded on 13th July. Its chief terms were the erection of Bulgaria into an 'automatic and tributary principality,' and of Servia and Rumania into independent states, the cession of the Bessarabian and Armenian districts, the conditional retention by Turkey of Eastern Rumelia (q. v.), with the Balkans for its boundary, and the 'occupation and administration' of Bosnia and Herzegovina by Austria-Hungary. The Russian army of occupation was limited to 50,000 men, and the period fixed at nine months from the signature of the Treaty. On the withdrawal of the troops towards Adrianople in the first week of October 1878, grave disorders were reported, especially at Silivria, and the commander-in-chief, General Tollenen, ordered re-occupation, while making energetic representations for the purpose of inducing the Porte to prevent the outbreak of atrocities. By the 10th October the Russians had re-occupied Tchekmedje and Tchataldja, and positions under the walls of Constantinople. Since the Treaty of Berlin, perhaps it would be more correct to say since the publication of the Anglo-Turkish Convention, R. has developed a more active policy in reference to Afghanistan, the issue of which it is difficult to foresee. See Schnitzer, *Les Institutions de la Russie* (2 vols. 1867); Eckardt, *Modern R.* (Lond. 1870, enlarged ed. 1874); Ralston, *Early Russian History* (Lond. 1874); Prof. Soloviev, *History of R.* (25th vol. 1875); D. Mackenzie Wallace, *Russia* (2 vols. Lond. 1877); Alfred Rambaud, *Histoire de la Russie* (Par. 1878); Rev. Malcolm MacColl, *Russian and English Diplomacy* (Lond. 1878), and *Turkey and Russia* (Edinb. T. C. Jack, 1877-78).

Russian Language and Literature. The Russian language is the most important member of the Slavonic branch of the Aryan family of speech, being spoken by about sixty millions of people. Of these, however, nearly four millions in 'White Russia,' and some fourteen and a half millions in 'Little Russia,' employ dialects deriving their names from those districts, both of which were long subject to the Lithuanians and Poles, the 'Little Russian' dialect being almost entitled to be styled a distinct language. But the remainder speak Russian proper, or

'Great Russian,' a language singularly free from *patois*, varying but slightly in the numerous provinces in which it prevails. There once existed a cultivated 'White Russian,' in which several works were written, but what is now so called is merely a dialect confined to peasants. 'Little Russian' still endeavours to hold its own as a literary language, and it can boast of several recent writers of note both in prose and verse. But its cultivation is discouraged by the Russian authorities, and it seems to be destined to the same fate as 'White Russian.' But 'Great Russian' has long been enlarging its area, is now spoken over a large portion of Europe and Asia, and appears likely to spread still farther. Modern Russian is sometimes called a descendant of the 'Church-Slavonic,' the language of the liturgies of the Russo-Greek Church; but that is incorrect. 'Old Russian,' the mother of modern 'Great Russian,' and 'Old Bulgarian,' the language employed by Cyril and Methodius in the translation of the Scriptures they made for their Slavonic converts to Christianity in the 9th c., seem to have been sister dialects of Slavonic speech. When the Russians in their turn became Christians, towards the end of the 10th c., they received from their Byzantine instructors the 'Old Bulgarian' version of the Scriptures, and the alphabet which had been invented for the purpose of writing it, and which was called, in memory of its inventor, Cyrillic. Their speech remained what it had been, 'Old Russian,' but the literature which began to exist among them, due at first entirely to the pens of monks, expressed itself in 'Church Slavonic,' a language now widely differing from that spoken by the Russian people. From a mixture of this 'Church Slavonic' with 'Old Russian,' gradually grew up the language in which Russian literature until a comparatively recent period expressed itself. The earliest writers of whose works specimens have been preserved were Luke Zhidyata, Bishop of Novgorod in 1036, Hilarion, Metropolitan of Kiev in 1051, and Theodosius, Abbot of the Petchersky Monastery at Kiev in 1062. Of the writings of each of the first two only a single homily or exhortation has survived; the third is known by an *Epistle to the Grand Prince Isyaslaf on the Latin Faith*, ten short exhortations to his monks, and one longer exhortation to the people. Most of the religious writings of this period, such as *Lives of the Saints* and similar works composed by monks, were of no great intrinsic value. But most valuable were the *Chronicles* which began to be compiled in monasteries, some of which have been preserved, and form the basis of Russian history. Chief among these is the work known as Nestor's *Chronicle*, its commencement being attributed to a monk of that name, who entered the cloister at Kiev about 1073, and died about 1115. Four 11th c. *Chronicles* have been preserved; two from the N., known as those of Novgorod and of Souzdal, and two from the S., the Kiev and the Volhynian. Those of the N. are meagre and dry; the Southern are richer in details, and more poetic in language. Next to the *Chronicles*, the most valuable written relics of the early period of Russian history, that in which the successors of Kurik ruled at Kiev, are the *Russkaya Pravda* or 'Russian Rights,' the code of laws issued by Yaroslav I., who reigned from 1019 to 1054, its enlarged recension issued by his grandson, Vladimir Monomachus, who reigned from 1113 to 1125, and the quaint *Instructions to his Children*, composed by the latter prince. To the 12th c. are attributed also the curious Letter or Petition addressed by Daniel Zatochnik (or the Exile) to a prince of Pereyaslavl, and the celebrated poem *About the Expedition of Igor*, describing an expedition undertaken by a Russian prince of that name against the Polovtsy in 1188. Unfortunately the unique MS. attributed to the 14th or 15th c., from which it was edited by Count Mussin Pushkin in 1800, is said to have been burnt during the fire of Moscow in 1812. In the fires kindled by the Tartars during the 13th c. many of the records of early Russian literature doubtless perished, and its development was long checked by the results of their conquests. During the long period of Tartar rule, little was written except in the cloister; only when it came to an end in the 15th c. did culture begin slowly to revive. Its principal fosterer was Maxim Grek, or the Greek (1480-1556), a monk from Mount Athos, who during his stay of thirty-eight years in Russia composed 140 different works, mostly of a polemical nature, directed against various heresies. He was himself, towards the end of his career, charged with heresy and with perversion of the Scriptures, and was banished to the Troitsa monastery, where he died. But the impulse he had given to education and study continued to act, and produced good results.

Writings became numerous, but they were still chiefly of a religious character. One of the most interesting of the literary records of the reign of Ivan IV., surnamed the Terrible (1533-84), is the Correspondence between that monarch and Prince Andrew Kurbsky, one of his nobles who fled into Lithuania, and who afterwards wrote a history of the Tsar's life and reign down to the year 1578. Another very interesting and valuable work belonging to the same period is the *Domostroi*, or *Household Management*, attributed to the priest Sylvester, whose influence prevailed during the brightest part of that Tsar's career. As Prince Kurbsky's *History* and his correspondence with Ivan IV. throw much light upon the life led by the public men of the day, so does the *Domostroi* bring clearly before its readers the private and social life of Russia, its sixty-three chapters showing how a citizen ought to live and conduct his household, and what should be his relations with his family and his neighbours. Among the most important works compiled about this time must be classed the *Great Chety Minei*, a long series of *Lives of the Saints*, due to the labours of the Metropolitan Makary; the *Sudebnik*, a code of laws, compiled by the order of Ivan IV.; and the *Stoglav*, or *Hundred Chapters*, a clerical statute-book, drawn up by a council of the Church convened by that Tsar in 1551. The want of correctness in the then existing scriptural and liturgical MSS. led, soon after that date, to the introduction of printing into Russia. In neighbouring Slavonic states it already prevailed, printing presses having existed in Cracow since 1491, and in Vilna, then a Lithuanian city, since 1525. In 1548 Ivan IV. sent to Germany for printers, but they were prevented from entering Russia. In 1553 he ordered a printing-office to be constructed at Moscow, and in 1564 appeared the first book printed in Russia, the *Acts and Epistles of St. Paul*. In 1565 another work appeared, but then the printers were accused of heresy, and obliged to leave Moscow. Two of them took refuge in Lithuania, where one of them managed the press set up at Ostrog by Prince Constantine Ostrozhsky (or of Ostrog), and there, in 1581, printed the first complete Slavonic Bible. In 1568 the Moscow printing-press resumed its labours, a *Psalter* appearing in that year. But the influence of the press was for a long time very slight. The transcribing of MSS. still went on, the printing of Church books being looked upon with a distrust which, among some of the Raskolniks or Dissidents, is still kept up, only written liturgical books being accepted by them. The avowed severance of the Raskolniks from the Established Church dates from the time of the correction of the Church books by the Patriarch Nikon, whose subsequent trial gave rise to one of the most important records of the time, the *Replies* which he made to the charges brought against him. The greater part of the books printed at the Moscow press were on religious subjects, but in 1647 appeared a work on the *Art of War*, and in 1649 the *Uloshenie*, or *Code of Laws*, drawn up by the order of the Tsar Alexis Mikhailovitch. During his reign dramatic performances commenced in Russia. The students of the Theological College founded at Kiev towards the end of the 16th c., were in the habit of acting mysteries or sacred dramas, and a literature of that kind sprang up in Little Russia, encouraged by the Metropolitan Peter Mogila (1597-1646), himself an author both in prose and verse. After a time these theatrical representations made their way to Moscow, some of them being composed by ecclesiastics of note, such as Simeon of Polotsk (1628-82), and Demetrius of Rostof (1651-1709). But although some progress in culture had by this time been made, it was not till Peter the Great had carried out his reforms that a Russian literature became possible. These extended to the Russian alphabet, which he modernised, its letters being made simpler and clearer than the Slavonic characters till then in use. Under his guidance, numbers of foreign books were translated, several printing-presses were set up, and (in 1703) the first Russian newspaper was founded. Many young men, of different social ranks, were sent abroad to study. Among these was a peasant named Pososhkof, who wrote several works, the most remarkable being a book *On Poverty and Riches*, containing a detailed account of the condition of Russia in his time. Another writer educated abroad was Vassily Tatishchev (1686-1750), who wrote a *History of Russia*, brought down to the year 1462. It was not published till thirty years after his death, when it was edited by command of Catherine II. He also did much for Russian geography, especially with respect to Siberia. Under Peter's successors, poetry began to be cultivated in Russia. Prince

Antiochus Kantemir (1708-44), the son of a former Hospodar of Moldavia, wrote eight rhymed satires, which rank among the best which Russia has produced. He also translated much, including the Epistles of Horace. Vassily Trediakovsky (1703-69) produced much verse, and attempted to draw up laws for poetical composition. He also turned his attention to the neglected field of Russian grammar, especially with regard to its alphabet and to orthography. But it was not till the time of Michael Lomonosof (1711-65) that anything systematic in that direction was done. That remarkable man, the son of a fisherman in the Archangel government, began his literary career under great difficulties, but he ultimately achieved success, and used it well. He wrote much on many subjects, chiefly scientific, both in prose and verse. But his great merit was that he systematised and simplified Russian grammar, and drew a clear line between modern Russian and the older language which had been so much influenced by Church Slavonic. Alexander Sumarokof (1718-77) was another prolific writer. He has been styled the creator of the Russian theatre, being the author of numerous dramas both in prose and verse, as well as of many other works. The first national theatre was opened in 1746 by a merchant at Yaroslaf, but not long afterwards Russian pieces began to be performed both at St. Petersburg and at Moscow. Under Catherine II., who was herself the author of several Russian comedies, much was written for the stage. The chief dramatist of the period was Denis von Vizin (1744-92), of whose numerous writings, on various subjects, two are still in vogue—*The Brigadier* and *The Minor*. Among the numerous writers in verse who rendered this period so brilliant, the chief lyric poet was Gabriel Derzhavin (1743-1816). He wrote a large amount of poetry, which is still highly esteemed, one of his odes, 'To God,' having extended his fame over a great part of Europe, and even as far as China. As an epic poet Michael Kheraskof (1733-1807) occupied the first place, the title of 'the Russian Homer' being gained for him by two long works, the *Rossiada*, celebrating the capture of Kavan by Ivan IV., and the *Vladimir*, describing the conversion of Russia to Christianity. Hippolit Bogdanovitch (1743-1803) was rendered famous by his poem called *Dushenka*, an imitation of La Fontaine's tale of Cupid and Psyche. He wrote several other works, the most interesting of which was the *Collection of Russian Proverbs* which he made at the request of the Empress Catherine. Another imitator of La Fontaine was Ivan Khemnitser (1745-84), the son of a Saxon who settled in Russia. His fables became famous after his death, and still continue to be read. Meanwhile a considerable periodical literature had sprung up. The Academy of Sciences, which was founded by Peter the Great in 1724, and inaugurated the following year by Catherine I., began to publish, in 1755, a literary journal, under the title of *Monthly Works for Edification and Diversion*. This was edited by Gerhard Muller (1705-83), a Westphalian who became naturalised in Russia, and who, besides writing many valuable books, rendered excellent service by editing a number of old Russian works hitherto preserved in MS. only, such as the *Statute-Book of Ivan IV.*, and the *Stepennaya Anga*, or *Step Book*, a genealogical table of the House of Rurik, drawn up by command of the same monarch, also the Russian histories of Tatishchev and Chilkof, and many others. This journal was followed by numerous periodicals of a similar kind, several of which were edited by Nicholas Novikof (1744-1818), the first Russian bibliographer, and the founder of the first circulating library at Moscow. After a time the number of journals increased rapidly, owing to the activity of Russian literature during the second half of the 18th c., till it was checked by the troubles to which the French Revolution gave rise. The first Russian author who obtained a European reputation was Nicholas Karamzin (1765-1826). Beginning as a writer of translations, lyric poems, and short romances, he commenced in 1803 his great *History of the Russian Empire*, on which he worked during the rest of his life. The twelfth volume, bringing the history down to the year 1611, was not published till after his death. Karamzin had a great influence on Russian prose, introducing a light, simple style. Most of his literary contemporaries were poets, all of whom were more or less imitators. The writers of the romantic school which flourished up to the time of Gogol, derived their inspiration from Germany, France, or England. Chief among them was Vassily Zhukovsky (1783-1852), a graceful translator and imitator, and an excellent writer of Russian verse. During the reign of Alexander I. the taste for poetry spread rapidly, the

number of its cultivators being immense. Ivan Dmitrief (1760-1837) was a fluent writer of lyrics, and his fables gained him a reputation which still survives. Baron Anton Delvig (1798-1831) wrote numerous idylls and other poems, some of which he contributed to the *Polar Star*. This 'literary almanack,' which political events afterwards rendered famous, first appeared in 1822, edited by two representatives of the party of progress, Kondraty Ryleyef and Alexander Bestujef. They both took part in the military insurrection which followed upon the accession of Nicholas in December 1825. The former was hanged, the latter was reduced to the ranks and exiled. Eugene Baratynsky, Nicholas Yazykof, Constantine Batyushkof, and a host of other writers, belonged to this period, so fertile in Russian verse. Many of them were dramatists. Such a service as Karamzin rendered to Russian narrative was rendered by Vladislaf Ozerof (1770-1816) to Russian tragedy, which he made more natural than before, better fitted to touch and to interest. Several other dramatists of note belong to this period. One of them, Alexander Griboyedof (1795-1829), is still remembered as the author of a very successful satirical comedy, *Gore of uma*, or *Misfortune from Cleverness*. Prince Alexander Shakofsky (1777-1846) is said to have exercised considerable influence on the development of the Russian theatre, for which he wrote numerous pieces and trained many actors; and Nicholas Khmelnitsky (1789-1846) was another popular writer for the stage. Ivan Krilof (1768-1844) also began his literary career as a dramatist, and some of his comedies are worthy of note. But it is to his *Fables* that he owes his widely spread reputation. Beginning as an imitator, almost translator, of La Fontaine, he gradually developed an original talent for satire and epigram which was appreciated not only at court and in fashionable society, but also by the middle classes and even the common people, into whose memory many of his couplets have sunk deep. His fables have been translated into many languages. The last twenty years of his life belonged to the most brilliant period of Russian literature. Both in prose and in verse, fiction was represented by writers who were far superior to most of the elegant imitators who preceded them, and they created a national literature which, based on a broad and solid foundation, is likely to endure. Russians usually name as their most illustrious and most characteristic author, Nicholas Gogol (1808-52). He was a native of Little Russia, and he owed his first success to his sketches of the life and manners of that part of the empire. Describing places and people as they were, he founded a realistic school of prose fiction which, as was the case elsewhere, completely displaced the romantic school which preceded it. His works have the merit also of being thoroughly Russian, founded upon incidents, and representing manners and customs, which are typical of the country and of the period in which he lived. No other Russian comedy was so successful as his *Revizor*, first represented in 1836, in which he depicts the official life of a provincial town, describing the commotion produced by the arrival of a stranger who is supposed to be on a visit of inspection, and portraying, in caricature, but still with truth and vigour, the various types of Tchinovniks or civil servants. And no other Russian novel has produced such a sensation as was caused by the appearance in 1842 of his *Mertviye Dushi*, or 'Dead Souls.' In it, while describing the expedition of an adventurer who swindles the government by means of fictitious purchases of 'souls,' as male serfs were called in olden days, he brings upon the stage a series of representatives of Russian life, landed proprietors, officials, and peasants, all seen from the point of view of a satirist, but all clearly distinguished from each other. The position held by Gogol among Russian novelists is occupied among Russian poets by Alexander Pushkin (1799-1837), whose *Eugene Onegin* is a work of real genius, a poem in which the individuality of the author makes itself clearly discernible, although the influence is sufficiently perceptible of Byron, the writer whom Pushkin most profoundly admired, and most often imitated. Outwardly it bears some resemblance to *Don Juan*, but the thought which inspires it is thoroughly Russian, and so are its characters and the life they lead. His other poems, especially the *Tsigan* or 'Gipsies,' *Fountain of Batchisarai*, and *The Prisoner of the Caucasus*, as well as his prose tales, bear witness to great powers which might, when matured, have produced still greater works; but in his thirty-eighth year he was killed in a duel. Such was also the fate, at a still earlier age, of the second of Russia's poets, Michael Lermontof (1815-41), who traced back his descent to a

Scotch family named Lermont. Like Pushkin, he was greatly influenced by Byron, but he also possessed, together with a remarkable mastery over verse, such intellectual qualities as might have enabled him to do much more than the works by which he is best known. Among these are *The Demon* and *Mtsyri* (a Georgian name for a lay-brother), in both of which he turned to good account his acquaintance with the then unfamiliar Caucasus; his novel, a *Hero of Our Times*, which has been widely translated; and many lyric pieces. In one of his poems he touched ground which might have yielded him rich material for song. His metrical romance *About the Tsar Ivan Vasilievitch* is written in imitation of the semi-historical poems, peculiar to Russia, called *bulinas*. It was from his study of another branch of Russian popular song that Alexis Koltsof (1809-42) gained the power which he possessed of expressing himself in a manner quite distinct from that of any of the poets of Western Europe. The son of a small cattle-dealer in the town of Voroneje, he pursued his literary career under great difficulties, but his intimate acquaintance with the life of the common people enabled him to write about them, and to express their thoughts and feelings, with truth. His native place gave birth also to another poet of the people, Ivan Nikitin (1826-61), who kept a small bookshop there. His poems resemble those of Koltsof in their truth to nature as well as in their genuine pathos. Another recent writer of great power was Nicholas Nekrasof who has left behind him a number of pictures of peasant life, drawn with singular force, truth, and pathos, as well as many other poems which are likely to survive. But recent imaginative writers have devoted themselves almost entirely to prose fiction. The best known among them is Ivan Tourguenief (born 1818), whose *Memoirs of a Sportsman* first gained him a reputation, which is now very widely spread, his works having been translated into many languages. Most of his writings, but especially his *Noble Nest*, and a number of minor tales, prove that he is a master of pathos, and a most subtle analyst and delineator of character. His more recent works, such as *Fathers and Children*, *Smoke*, and *Virgin Soil*, show how great is his power of representing the different phases through which during the last twenty years Russian thought has passed on all that concerns the social and political questions of the day. Another novelist of real power is Count Leo Tolstoy, whose principal work, *War and Peace* (1868), contains a series of remarkable pictures of Russian life at home and in the field during the early part of the present century. His later work, *Anna Karenina*, is also a novel of great power. One of the most striking of recent Russian novels is the *Oblomov* of Ivan Gontcharof, which has given rise to the term 'Oblomovism,' to express the peculiar mixture of indolence and despondency to which Russian natures are peculiarly liable. Among other noteworthy novelists may be mentioned Grigorovitch and Pisemsky, authors of very realistic descriptions of Russian life; Dostoevsky, best known by his *Notes from a Prison House*, giving an account of convict life in Siberia, and by his *Crime and Punishment*, a psychological study of a murderer's career; Tcherniaishvsky, the author of a Nihilist story entitled *What is to be Done?* which produced a great sensation; and Soltykof, who, under the pseudonym of Stichedrin, has produced a number of satirical works, such as the *Provincial Sketches* and the *Tashkentians*, intended to lash the faults and follies of his countrymen. Of the writers of recent historical novels, a branch of fiction much cultivated in Russia, Count Alexis Tolstoy may be taken as the representative, the author of *Prince Serebryanny*, a tale of the times of Ivan the Terrible. He was also the author of several historical dramas. But the only dramatic writer of note who has appeared for some years past is Ostrovsky, the author of a great number of plays, chiefly devoted to depicting the life led by the commercial and official classes. Poetry and the drama have for some time been neglected in Russia. Prose fiction flourishes, supported by the aid of several excellent reviews or magazines, one of which, the *Messenger of Europe*, yields in merit to scarcely any Western periodical. On graver subjects much has been written. Among the critical writers whom Russia has produced, the most remarkable was Vissarion Bielinsky (1815-41), to whom the literary men of the early portion of the reign of Nicholas, the most brilliant period of Russian poetry, were greatly indebted. He was an ardent supporter of the cause of the *Zapadniki*, or 'Occidentals,' whose great object was to raise Russia to the level of Western Europe in culture and general civilisation against the

Slavophiles. To the latter party belonged several writers of note, such as the poet Alexis Khomyakof (1804-60). Among works of research, the best have been those devoted to the history, archaeology, literature, and resources of Russia. The time has not yet come for the completely free handling in that country of political, religious, and metaphysical questions; and the Russian writers who have turned their attention to them in exile have not, with the exception of Alexander Herzen, so long the influential editor of the *Kolokol* or *Bell* and the *Polar Star*, produced any works of note. But on all that concerns the history of their native land, a number of Russian authors have thrown light by means of very many excellent works. The histories of Russia by Solovief and Bestujef-Ruimin are of great value, and an immense amount of historical material has of late years been printed by learned societies, and in such periodicals as the *Russian Antiquity*, and the *Russian Archive*. Other writers of note on Russian history and archaeology are numerous, such as Kostomarof, Pogodin, Polevoi, Ilovaisky, Zabyelin, and a host of others. One subject connected with Russian literature has of late years been well worked, the folklore of Russia. In the memories of the common people have been preserved rich stores of legendary fiction, both in prose and verse, and numerous collections have been made and commented upon. The collections of folk-tales by Afanasief, and of *bulinas* or metrical romances by Ruibnikof, the Kireefsky Brothers, Bezsonof, and Hilferding, and the comments upon them by Buslaef, Stassof, Orest Miller, and many others, yield in merit to no similar works produced elsewhere. Theology has produced a literature of its own, but, like the Russo-Greek Church to which it owes its existence, it is formal, narrow, and antiquated. Science is represented yearly by many volumes, but there are few of its branches in which contributions have been made by Russia to the literature of the world. The study of the Oriental languages has been forced upon Russia by her geographical position, and many valuable works upon them have been published in that country, especially as regards the languages of Central Asia and the Caucasus. And from the time of Athanasius Nikitin, a merchant of Tver, who made a journey in 1470 to the East Indies, of which he left behind him an interesting account, there have been many books of travel written, some of which, like the recently-published *Mongolia* by Przewalski, have become generally known by means of translations. In many branches of knowledge the Russians still occupy the position of learners, and have not yet begun to teach. And the masses of the people being all but utterly unlettered, in spite of the efforts which have been made to educate them during the reign of Alexander II., the public to which literature has to appeal for support is comparatively small. Up to the end of the year 1823, there were printed in Russia, according to Sopikof, 13,249 Russian and Slavonic books. Under the repressive government of Nicholas, the publication of Russian books fell off, but with the accession and the early reforms of Alexander II., literature began to flourish anew. Mezhof's catalogue of books, published in 1875-76, mentions 1217 literary works, 798 theological, 44 philosophical, 500 educational, 351 judicial and political, 163 technological, 521 historical, geographical, &c., 204 mathematical, 223 military and naval, 180 on natural science, 336 medical, 496 linguistic, 42 artistic, and 395 periodical works, making a total, including miscellanies and also re-issues of the same work, of 5865 publications. See Otto, *History of Russian Literature* (Oxf. 1839); Talvi, *Languages and Literature of the Slavic Nations* (New York, 1850); Galakhof, *Istoriya Russkoi Slovesnosti* (2 vols. St. Petersburg. 1863-76); Polevoy, *Istoriya Russkoi Literatury* (2d ed. 1874); C. Courrière, *Histoire de la Littérature Contemporaine en Russie* (Par. 1875).

Russian Leather. The manufacture of leather is one of the oldest staple industries of Russia. One variety of soft tanned leather, white in colour or dyed red or black, is prepared from heifer hides. It is called *yout*, or R. L. White and black *yout* is chiefly consumed within the bounds of the empire for making boots, belts, cartridge-pouches, &c. for the army, and for many other purposes. The red kind, however, is well known as R. L. in Western Europe, where it is extensively employed in bookbinding, for travelling-bags, cigar-cases, porte-monnaies, &c. It is soft and pliant, grained, unaffected by damp, and possessed of a peculiar and somewhat fragrant odour which repels insects and thereby protects the leather from their ravages.

The red colour is produced with a solution of alum and extract of red sandalwood, and the peculiar smell is due to the empyreumatic oil of birch bark, which, mixed with oil or fat, is employed in the process of currying. Paris now manufactures R. L. from sheep and goat skins after the methods pursued in Russia with heifer-hides.

Rust is the common name for a parasitic fungus which attacks the leaves, glumes, stalks, &c. of cereals and grasses, showing itself in the form of orange and brown rust-like spots and blotches breaking out from the internal tissue of the plant. It is most common on barley, wheat, and oats, less so on rye and the wild grasses, though many of the grasses are infected, thereby maintaining a supply of the fungus ready to attack the corn-crops whenever these are brought into a state adapted to receive the protospores. This pest is now named by botanists *Trichobasis Rubigo vera* (and one or two allied species), belonging to the order *Pucciniae* (see *URED*O). Amongst farmers the names R., red-rag, red-robin, and red-gum are current.

Rustchuk, a picturesque town of Bulgaria, on the S. bank of the Danube, opposite Giurgevo, 40 miles S. of Bucharest and 38 N.W. of Rasgrad by the R. and Varna Railway. It is defended by several batteries, and has thirty mosques, several Greek and Armenian churches and synagogues, two public baths, &c. Till 1877, when it was captured by the Russians, R. was the residence of a Turkish vali-pasha, and it is still the chief industrial town in the lower course of the Danube, manufacturing extensively linens, silks, muslins, leather, cigars, pipe-heads, and pottery. Pop. 22,000, of whom about half are Turks, one-fourth Bulgarians, 956 Jews, 778 Armenians, and 469 gipsies. In the war of 1877-78 the left division of the Russian army under the Csarevitch was called the army of R., and proceeded after the crossing of the Danube in the direction of the city, but did not venture to attack it.

Rustic, or **Rusticated Work**, masonry in which the joints are grooved or channelled. Sometimes only the *horizontal* joints are so treated, sometimes all. The grooves, either moulded or plain, are formed in different ways, and the surface of the stone is either artificially roughened, or, as is now more usual, left smooth. R. is frequently used in rough Gothic work, but is most common in classical or Italian architecture.

Rutabaga. See *TURNIP*.

Rutaceæ is a natural order of thalamifloral Dicotyledons of Hooker's cohort *Geraniales*, consisting of shrubs or trees, or rarely herbs, with compound or simple ex-stipulate leaves dotted with translucent glands; from four to five sepals, petals, and stamens; an annular disc, between stamens and ovary; four or five carpels, mostly connate; oblong or reniform seeds, and large embryo. The orders *Aurantiaceæ* and *Zanthoxyleæ* being now included under R., render the number of species belonging to it about 700, divided into seven tribes, and distributed through the hot and temperate zones of both hemispheres. Many genera are confined to tropical America (tribe *Cuspariæ*), to the Cape of Good Hope (tribe *Diosmeæ*), to Australia (tribe *Boroniæ*), and to S. Asia (most of tribe *Aurantiaæ*).

Rutebeuf, a famous trouvère of the 13th c. Almost nothing is known of his history. From his writings we learn that he had no other profession than that of *rimneur*; while a phrase in his *Dit de l'Erberie* leads to the conclusion that he was a native of Champagne. R., however, was no common minstrel or jongleur. If misery forced him to beg, he addressed himself to the King and to the most illustrious personages of France. That he suffered from poverty is not wonderful. By his own admission he was idle, debauched, evil-tongued, and addicted to gambling. The fifty-six pieces which R. has left are mostly short; they comprise satirical or devotional *dit*s, historic songs, hymns, plaints, in which he celebrates the memory of his dead benefactors or mourns over public calamities, *tensons*, a small number of *fabliaux*, two legends, some allegorical trifles, and a drama. R. is a very unequal writer; he is rude and full of affectations, but there is within so much verve, originality, and energy in his poems—so much, in a word, of genuine inspiration—that modern criticism has assigned him a foremost place in the ranks of the trouvères. Satire is his true element. In this respect he foreshadows the characteristic feature of later French literature, and may be regarded as a medieval Voltaire or La

Fontaine. Princes, popes, prelates, barons, bourgeois, advocates, even serfs, are in turn the butt of his ridicule; but it is against the religious orders that he darts his keenest and most pungent epigrams. Perhaps the finest of his *fabliaux* is *Charlot le Juif*. One of his pieces, entitled *Mort ou la Repentance R.*, has given rise to the conjecture that this merciless mocker of priests closed his career in the cloister, seeking there the repose denied him in the world. See A. Jubinal, *Œuvres Complètes de R.* (2 vols. Par. 1838-39).

Ruth, **Book of**, gives the family history of the great-grandparents of David, King of Israel. Ruth was a Moabitess, who had married a Jew of the name of Mahlon, one of two sons of a family which was driven to the Land of Moab in the time of a famine. When both were now widowed, Ruth accompanied her mother-in-law on her return to Bethlehem, where she was married to Boaz, a relative of her first husband. By him she became the mother of Obed, the father of Jesse, the father of David. The circumstances described thus happened in the third generation before David, which is more definite than 'the time when the Judges ruled' (i. 1). As to the date of its composition, it must have been written at least as late as the reign of David, whose genealogy it gives. Ch. iv. 7 implies that it was not written till a considerable time after the events related. As an idyllic picture of antique unsophisticated life it possesses an enduring charm. See Bleek's *Einleit. in d. Alt. Test.* (Eng. trans. 1869).

Ruthenians, or **Russniaks**, a branch of the Slavonic race, chiefly inhabiting Galicia and Northern Hungary, their total number in the Austro-Hungarian empire amounting (1876) to 3,200,000, according to Dr. A. Ficker's estimate. The R. are ethnologically almost identical with the Little Russians of Podolia and Volhynia (also sometimes known as R.), and belong, for the most part, to the Greek United Church. They preserved their dialect through the Polish domination of the 17th and 18th centuries, a domination that led to the massacre of hundreds of Polish nobles by infuriated peasants in 1846, and to the opposition offered by the Ruthenian to the Polish members in the Pan-slavic Congress at Prague (1848). Of late years the Russniak dialect has sunk to a patois, being superseded in literature by Russian. The songs and folklore of the race, however, had been already collected in Vailav's *Piesni Polskie i Ruskie* (Lemb. 1833). See Biedermann, *Die Ungarischen Ruthenen, ihr Erwerb und ihre Geschichte* (Innsb. 1862-68).

Ruthenium (Ru = 104.2), one of the platinum metals, associated with iridium, osmium, and rhodium in platinum ores. The metal is hard, brittle, almost infusible, and scarcely affected by even aqua regia. Four oxides are known, of which one, *Ruthenic acid* (RuO₄), has not been obtained separate from its salts. The binoxide (RuO₃) and sesquioxide (Ru₂O₃) have feeble basic properties. The protoxide (RuO) is a dark-grey powder insoluble in acids.

Ruth'erford, Samuel, a Scotch divine, born about 1600 in the parish of Craigh, Roxburghshire, studied at Edinburgh, was chosen professor of classical literature in 1623, but soon turned his attention to theology, and in 1627 was settled as parish minister of Anwoth in Kirkcudbrightshire. In 1636 he published at Amsterdam an elaborate work in Latin on the Arminian controversy, entitled *Exercitationes Apologeticae pro Divina Gratia*. For this he was deposed in 1636, and ordered to confine himself to the city of Aberdeen, then a stronghold of Episcopacy. Here he wrote most of those Letters (first published in 1664) which have given him so great a celebrity. R. took part in the famous Glasgow Assembly of 1638, and was soon after appointed professor of divinity at St. Andrews. He went in 1643 as one of the Scotch Commissioners to the Westminster Assembly, issued his famous *Lex Rex* in 1644 against the doctrine of absolute monarchy, became Principal of St. Andrews in 1649, and was twice offered a chair of divinity in Holland in 1651. He died March 19, 1661. R. wrote numerous other works both in Latin and English. He was a man of great piety and intellectual fervour.

Ruth'erglen, popularly **Bug'len**, a town in Lanarkshire, on the left bank of the Clyde, 2½ miles S.E. of Glasgow by rail. It formerly consisted of one long and wide but irregularly built street, with smaller streets branching from it from N. to S., but of late years it has been almost entirely rebuilt, and largely

extended. It is separated from the river by a low and rich tract of burgh land, known as the Green. The townhall in Main Street, erected in 1861 at a cost of £7,000, is the finest building. R. has six churches and a public library. Its trade is chiefly dependent upon that of Glasgow, and many of its inhabitants are engaged in weaving muslins for its manufacturers. It has also (1878) very extensive chemical works, three power-loom manufactories, a paper-mill, a pottery, tube-works, and a boat-building yard. Its fairs are noted for a great show of horses, particularly of Clydesdale breed. R. unites with Kilmarnock, Dumbarton, Port-Glasgow, and Renfrew in returning a member to Parliament. Pop. (1871) 9543. R. is one of the most ancient royal burghs in Scotland, having received its charter from David I. in 1126. In 1226 its boundaries were fixed to exclude Glasgow, which had previously formed a part of it. Its old castle was demolished by the Regent Murray after the battle of Langside. Until recently the town did not advance with the prosperity of the times.

Ruthin (Cym. *Rhyd-din* or *Castell-Coch*, 'red castle'), a town of Denbighshire, N. Wales, on the Clwyd, 7 miles S.E. of Denbigh by rail, has an old collegiate church, a corn-exchange and market-hall in Continental Gothic style (1864), a county-hall and prison (enlarged 1867), and a grammar-school (founded in 1592). The ancient castle, built in the 13th c., was dismantled by the Roundheads in 1646, and its site is now occupied by a fine castellated mansion. Lead-mining in 1871 employed 185 men. R. returns one member to Parliament with Holt, Denbigh, and Wrexham. Pop. (1871) 3298.

Ruthven (pron. *Rivers*), **The Raid of**, was a conspiracy contrived in 1582 by William, first Earl of Gowrie, in conjunction with Lord Lindsay of Byres, the Earl of Mar, and the Master of Glamis. These determined to seize young James VI. at the castle of Ruthven, to remove from power his guardians, the feeble Lennox and the profligate Arran, and to take the government into their own hands. A thousand men surrounded the castle and surprised the king. Arran was imprisoned, and Lennox forced to take refuge in France, where he died broken-hearted. The conspirators kept possession of the king for a year, but at the end of that time he escaped their vigilance and put himself under the protection of the governor of the castle at St. Andrews. Gowrie and the others were at first pardoned, but afterwards declared traitors. Gowrie, when about to leave Scotland at Dundee, was induced to join in a plot to seize Stirling Castle, and failing, was tried for treason and executed.

Rutlam (*Rattam*), the capital of the native state of the same name in Central India, 44 miles W. by N. of Oojein. It is well built, and forms a centre of the opium trade. The state of R., which is the chief Rajput state in W. Malwa, has an area of 1200 sq. miles; pop. about 100,000; revenue, £130,000, of which £70,000 is alienated in feudal grants. A tribute of £8400, formerly paid to Scindiah, is now received by the British.

Rutlandshire (Celt. *rhudd*, 'red'), the smallest of the English counties, is bounded N.E. by Lincoln, S.E. by Northampton, and W. by Leicester. Area, 94,889 statute acres; pop. (1871) 22,073. The formation is Oolitic, and the soil is loamy, devoted chiefly to tillage in the eastern, and to pastures in the western half of the county. The south-eastern boundary is formed by the Welland, which receives the Eye Brook, the Chater, and Wash. The surface, with the exception of a slightly-elevated tableland in the N.E., is generally level. In 1876 there were 26,401 acres under corn crops; 7692 under green crops; 7585 in clover, sainfoin, and grasses in rotation; 40,900 in permanent pasture, and 3094 in woods. There were also 3119 horses, 16,756 cattle, 97,256 sheep, and 3423 pigs. Two members are returned by the county, the capital of which is Oakham. Uppingham is the only other place with more than 2000 inhabitants.

Ratnagerry (*Ratnagiri*), the chief town of the district of the same name in the Bombay Presidency, British India, on the shore of the Arabian Sea, 150 miles S. of Bombay. Pop. (1872) 10,614.—The district of R., which lies between the E. Ghauts and the Arabian Sea, N. of the Portuguese territory of Goa, has an area of 3789 sq. miles; pop. (1872) 1,019,136. The crops are rice and other grains, betel, and cocoa-nuts. R. suffered, though not severely, from the famine of 1877.

Ruviga'do, a town in the United States of Colombia, province of Antigua, at a height of 8900 feet above the sea. It has a considerable trade. Pop. 10,000.

Ruvo di Puglia (the *Rubi* of the Romans), a town of S. Italy, province of Bari, 23 miles W. of the city of that name. It has two museums of ancient vases, some trade in grain and dried fruits, and considerable pottery. Pop. (1874) 15,083.

Ruysdael, Jacob, one of the chief Dutch landscape painters, was born at Haarlem, about 1625. He was the pupil and friend of Berghem, but little is known regarding his life. His pictures represent Dutch scenery on or near the Rhine, and one of his pictures in the Louvre is allowed even by Ruskin to have 'freedom of action and power of colour.' He is less conventional than Hobbema, whom he excels in breadth of treatment and general airiness. The catalogues ascribe to him 448 works. He died at Haarlem, November 16, 1681.—**Salomo E.** (1613-70), was also a good landscape painter, noted for his faithful rendering of marble.

Ruyter, Michiel Adriaanszoon van, the famous Dutch naval hero, was born at Vliessingen, 24th March 1607. After a long and adventurous career as a trader, he made a sufficient fortune, and proposed at the age of forty-five to quit the sea and take to gardening. But soon the war with England broke out, and R., against his will, was made an admiral. He wrote to the Government, 'I have beaten about the seas, and braved so many dangers, that I would fain end my days in rest.' He fought under Tromp in all his battles with the English, and having succeeded to the chief command of the fleet, fought three great battles with the English, ran up the Thames to Gravesend, forced the boom that protected the Medway, burnt three men-of-war anchored in the river, and for six weeks sailed proudly along the southern coast of England, master of the Channel. The peace of Breda (1667) was more due to his valour than to diplomacy. In 1673 he resisted the combined fleets of France and England till the English nation grew tired and ashamed of the war. Sent to Sicily to support Spain against France, R. was severely wounded in the affair of Mongibello near Messina, and died at Syracuse, 29th April 1676. He was buried in the Nieuwe Kerk at Amsterdam, where, as at Vliessingen (1841) and Rotterdam (1856), a monument was erected in his honour. See Otto Klopp, *Leben und Thaten des Admirals de Ruyter* (Hannover, 1852), and Jacob de Liefde, *The Great Dutch Admirals* (Lond. 1873).

Ryan, Loch, a land-locked arm of the Firth of Clyde, which runs S.E. into Wigtownshire from Corsill Point, with a length of 10 miles and an average breadth of 2 miles. It affords safe and commodious anchorage, being of great depth close to its E. shores, and sheltered by the hills of Finnart and Craigcraffie. The W. shore is low, but slopes gently to the beautifully wooded hills of Kirkcolm and Leswalt. It has been rendered classic by the pathetic ballad, *Fair Annie of Lochryan*, and by the late Hew Ainslie's spirited song, *The Kover o' Lochryan*.

Rybinsk (Slav. 'fish town,' from *ryba*, 'a fish'), a town of European Russia, government of Jaroslav, on the right bank of the Volga, 416 miles S.S.E. of St. Petersburg, has immense transit trade, chiefly in corn, flour, tallow, timber, metals, and spirits. The landing-place is several miles long, and upwards of 7000 barges are built here every year. In summer there are sometimes about 100,000 people in the town. Pop. (*St. Petersburg Calendar*, 1878) 15,047.

Ryde (Celt. *ryd*, 'a fort'), on the N.E. coast of the Isle of Wight, 4 miles from Southsea Pier across the Solent, is greatly changed from what it was in 1753, when Fielding wrote of it as 'a pleasant village, separated at low-water from the sea by an impassable gulf of mud.' The modern fashionable watering-place has capital sands, an esplanade nearly a mile in length, two piers, one of them 768 yards long; while its wooded slopes are lined with well-built villas. There are six churches, eight chapels, and twelve hotels, besides a town-hall, theatre, school of arts and museum, masonic hall, infirmary, and the Royal Victoria Yacht Club-house (1847-64). R. publishes five newspapers, and had a pop. (1871) of 12,576, largely increased by summer visitors.

Rye, a town of Sussex and one of the Cinque Ports, 11 miles E.N.E. of Hastings by rail, lies nearly 2 miles inland from its

harbour, owing to changes in the coast-line. The parish church, one of the largest in the kingdom, has a Transition nave, the central tower, aisles, transept, and chancel being mainly Early English. Other edifices are the 12th c. Ypres Tower (now used as a police station), the ancient Land Gate, a Carmelite chapel (converted into a dwelling-house), the town-hall, and Pocock's Grammar-school (1644), where Thackeray's 'Denis Duval' learnt 'to speak English like a Briton.' The harbour, formed by the confluence of the Tillingham and Rother, was entered in 1877 by 306 vessels of 22,409 tons, and cleared by 85 of 6000 tons; while on 31st December of that year 90 ships of 6627 tons were registered as belonging to the port. The imports amounted (1876) to £13,946; the customs to £200. Shipbuilding (in 1877, 22 British sailing-vessels of 1151 tons) and fishing are the leading industries, the latter employing 226 boats and 1020 men and boys. R. publishes a weekly newspaper, and returns one member to Parliament. Pop. (1871) 4366. The *Nexus Portus* of Ptolemy, R. was the landing-place of Danish pirates (893), furnished nine ships to Edward III., and became a Huguenot asylum (1572).

Rye (Old Eng. *ryge*; Welsh, *ryg*; Old Norse, *rugr*), or *Secale cereale*, is a corn-plant related to the wheat genus (*Triticum*), and is distinguished by its spiked inflorescence bearing spikelets with two perfect florets, and one long-stalked rudimentary floret. It is reported to occur in a wild state on mountains in the Crimea, and it is probably also indigenous in the district between the Black and Caspian Seas. Formerly R. was raised in considerable quantity in England, either alone or mixed with wheat, obtaining in the latter case the name of *meslin* (old Fr. *meslé*, 'mixed'), the mixed grain, when ground, furnishing a wholesome and palatable household bread. At present it has passed out of use for this purpose, but is grown as a green crop for fodder. It dislikes wet ground. In the colder parts of Europe, and in some parts of Asia, R. is still much cultivated. The bread made from it—known as black-bread—is heavy and soulish, but keeps moist for a long time. R. is also cultivated on the Continent for distillation, the spirit which is called Hollands being principally obtained from it. The malted grain makes a good beer. The straw of R. is solid, causing it to be inferior as fodder, but making it more valuable for litter, and particularly for thatching and straw-plaiting. There are annual, biennial, and perennial varieties of R. The grain is liable to the attacks of a fungus producing the Ergot (q. v.) of R.

Rye-Grass (*Lolium*) is a small genus of *Gramineæ* differing from the allied genus *Triticum* by having the upper glume absent, except in the terminal spikelet, and the lower persistent, facing the rachis. The most important species is *L. perenne*, with its cultivated annual and biennial forms such as *L. italicum*, *L. multiflorum*, &c. Its value as a fodder-grass has long been recognised. The plant is a native of Europe, the neighbouring parts of Asia, and N. Africa. In Britain it is common in waste places, and grows naturally in meadows and pastures. The good qualities recommending the type form to cultivation are its suitableness to a great variety of soils, the facility with which it is propagated, the abundance and uniform ripening of its seeds, and the fibrous structure of its roots, which eminently fits it for alternate husbandry. It has been introduced into N. America and Australia. Italian R.-G., which is a variety of biennial or triennial duration, is rapid and luxuriant in its growth, with the further advantage of being highly relished by cattle. It is usually chosen as an early temporary shelter for tenderer but more lasting grasses, intended to form permanent pasture.

Rye House Plot, The, was originated for the purpose of securing the Duke of Monmouth as successor to Charles II. Colonel Rumsey, Lieut.-Colonel Walcot, Goodenough, Under-Sheriff of London, Ferguson, an Independent minister, and others—the first and last of those mentioned being ringleaders—determined to assassinate the king on the way from Newmarket. The plot was laid in a house called the Rye House, belonging to one of the conspirators. By the plan agreed upon, the king's coach was to be overturned, and its occupants were to be fired at from behind the hedges. But the king's house

at Newmarket took fire, and his majesty left the place eight days sooner than was expected, so escaping the trap laid for him. The scheme was discovered: Lord Russell, Algernon Sidney, and Walcott were executed; John Hampden was fined £40,000, and every one concerned was punished except the Duke of Monmouth himself. Some assert, however, that the R. P. was entered into without the duke's connivance.

Rymer, Thomas, born in Yorkshire, 1639, was educated at the grammar-school of Northallerton, entered Sydney-Sussex College, Cambridge, and was called to the bar at Gray's Inn, 1666. In 1677 he published a play—*Edgar, or the English Monarch*—and this was followed by *A View of the Tragedies of the Last Age* (1678), *The Antiquity, Power, and Decay of Parliament* (1684), *A Short View of Tragedy* (1693), and a translation of Rapin's *Reflections on Aristotle's Treatise of Poetics* (1694). He was appointed historiographer to the king when Shadwell died in 1692, and was employed on a scheme of Montague and Lord Somers for the collection of state papers relating to transactions between England and the States. In 1703 the first volume of this work appeared under the title of *Fœdera, Conventiones et cujuscunque generis Acta Publica inter Reges Angliæ et alios Principes*. Seventeen volumes of the *Fœdera* were edited by R., and three more by Sanderson. It was reprinted at the Hague in 10 vols. (1739). R. died in poverty, December 14, 1714.

Rymour, Thomas, the father of Scottish poetry, flourished towards the close of the 14th c. His name appears to have been Thomas Learmount of Ercildoun (Earlston); but an ancient charter designates him Thomas Rymor, while his son describes himself as heir of Thomas Rymour of Ercildoun, and Blind Harry speaks of Thomas the Rhymer. His prophetic, more than his poetical powers, seem to have attracted attention at an early date. The story goes that he was snatched from earth when a child by the queen of the fairies; that he returned among mortals for seven years; and that, as he was one day feasting in the tower of Ercildoun, word was brought that a hart and a hind were walking through the village, upon which he rose to follow them, and was seen no more. His famous prophecy regarding the death of Alexander III. was made in 1280 (according to the continuator of Fordun); and in 1299 his son, in assigning the estate of Ercildoun to the convent of Soltra, calls himself *filius et heres Thomæ Rymour de Ercildoun*. Thomas must accordingly have died between these dates. The poems at a late date popularly ascribed to him are to be found in *The Whole Prophecies of Scotland, England, Ireland, France, and Denmark, prophesied by Thomas R., marvellous Merlin, Beid, Berlington, Waltheave, Elthain, Rannester, and Sybilla*, a book the first known edition of which was printed by Waldegrave in 1603. Robert of Brunne commemorates Thomas as the author of a romance founded on the story of Sir Tristram. A MS. in the Auchinleck collection, supposed (but not with great probability) to be this romance, was edited by Sir Walter Scott in 1804. The other poems ascribed to Thomas, viz., the *Gest of Kyng Horn* and *Thomas of Erssildoune*, a series of prophecies introduced by a weirdly fantastical fairy tale, belong to a later age.

Ryot (*raiya*, derived from an Arabic word meaning 'to pasture or protect'), the word used throughout India for the actual cultivator of the soil. It was introduced by the Mahomedans, and, like the rayah of European Turkey, owes its origin to the maxim of the Koran that submissive subjects, even though infidels, are to be protected so long as they pay tribute.

Ryotwar (the adjective formed from *ryot*), the Indian term for the settlement of the land-revenue concluded by the Government with each actual cultivator of the soil, without the intervention of a third party. The R. system which principally prevails throughout the Madras Presidency, introduced chiefly by the efforts of Sir T. Munro, governor from 1820 to 1827, makes a fresh settlement every year; the Bombay R. settlement is concluded for a term of thirty years.

Ryswick, Treaty of, in 1697, between England, France, and Spain on September 20, and by Germany on October 30, closed the war of the Orleans succession to the Palatinate. The scene of the treaty is a Dutch village between Delft and Hague.

S.

The nineteenth letter of the alphabet, corresponding to the Semitic Samech and the Greek Sigma. It must be distinguished from the Semitic Shin, which is found in archaic Greek as San or Sampi, but has not maintained its position in any European language. This was a double letter = sh. The form of S can be traced through inscriptions from M to ζ and Σ . It is a sibilant semi-vowel, with two sounds in English, one sharp and the other flat. The sharp sound, heard everywhere but at the end of syllables, is its proper phonetic value; the flat S, as pronounced at the end of words, is really identical with Z. As a compound letter, S combines with the gutturals to make X, and with P to make the Greek Psi. It is perhaps more used than any other letter in grammatical inflexions, e.g., to form the plural in most languages of the Aryan family. S interchanges with R, as *honos* = honor, and with T, as tension and tent, Greek *thalatta* and *thalassa*. But the most instructive change is with H, Gr. *hex* = Lat. *sex*; so Scinde and Hindu have the same root. The English pronunciation of final S as Z may be paralleled by the change of Lat. *nasus* into Fr. *nez*.

As an abbreviation S stands for south, and frequently for society and secretary. S.T.P. = Sanctæ Theologiæ Professor or Doctor of Divinity; S.L. = Serjeant at Law; S.V. = *sine voce*, or look under the word mentioned; SC. = *scilicet*, or forsooth; S., or St., = saint.

Saad-ed-din, Mohammed, a Turkish historian, was born in 1536. He was the son of Persian Hassan, chamberlain of Selim II., and was brought up among the pages of the imperial palace, and early instructed in theology and jurisprudence. In 1573 he was appointed by Selim II. *Rodja* ('preceptor') to his son Murad, on whose accession to the throne he was appointed royal historiographer. With Mahomet, whose education he had also superintended, he had great influence, and was raised by him to the dignity of *mufiti*. He died at Constantinople, October 2, 1599. His great work, which, however, is more distinguished for its style than its accuracy, is a general history of the Ottoman sultans from 1299 to 1520, called *Tij-al-Tawarikh* ('crown of histories'). It has been in part translated into Italian by Vincent Bratiutti under the title *Cronaca degli Ottomani* (Vienna and Madrid, 1646-52). S. also wrote a History of Selim II.

Saa'di, Sheikh Muslih Addin, one of the most popular of Persian poets, was born at Shiraz in 1184, and educated at Bagdad, where he studied science and theology. A great part of his life was spent in travelling. He is said to have made the pilgrimage to Mecca fourteen times, and besides, to have visited Europe, Egypt, Barbary, Abyssinia, Palestine, Syria, Asia Minor, Turkestan, and Hindustan. The last thirty years of his life were spent in retirement in his native and beloved Shiraz, where he died in 1275. In modern times a beautiful tomb was erected to his memory by the Wâkil Kerim Khan, and endowed with gardens and lands for the support of dervishes to watch over it. At Shiraz, S. composed his two famous poems—the *Gulistan* ('Rose Garden') and *Bustan* ('Pleasure Garden'), the one consisting of stories in prose interspersed with couplets, verses, and moral apologies in verse; the other entirely in verse. These works were followed by the *Pend-Nameh* ('Book of Instructions'). The poems of S. are without the exaggerations customary with Persian poets. They show the depth of religious sentiment, the independence of mind, hatred of tyranny, generosity and wide charity of their author, and they are filled with the placid wisdom of experience. Some of his love-songs are

exquisite, full of the tenderest affection blended with refined and delicate feeling. The first complete edition of the works of S. was that published by Harrington (Calcutta, 1791-95). The *Gulistan* was edited with a Latin translation by Gentius (Amsterdam, 1651), the text alone by Eastwick (Hertford, 1850), and F. Johnson (Lond. 1863), and has been translated into English by Gladwin (Calcutta, 1806; reprinted Lond. 1808 and 1827), Eastwick in prose and verse (Hertford, 1852, and John Platts (Lond. 1873). The *Bustan* has been edited with a commentary and vocabulary by Maulavre Tummuzdey (4th ed. Cawnpore, 1832), and the Persian text with a Persian commentary by C. H. Graf (Vienna, 1858).

Saale, a river of Germany, rises near Zell, in Upper Bavaria on the N.W. slope of the Fichtelgebirge, at a height of 2293 feet, flows generally N. with a winding course, and joins the Elbe at Barby after a course of 225 miles. The S. receives from the right the Elster, and from the left the Ilm, Unstrut, Wipper, and Bode. It is navigable from Naumburg. The *Franconian S.*, 69 miles long, joins the Main at Gmünden.

Saalfeld, an old town of Germany, and capital of a former duchy of the same name, in Sachsen-Meiningen, situated on the left bank of the Saale, 6½ miles S.S.E. of Rudolstadt by rail. The chief buildings are the Kathhaus, built (1533-37) in the latest Gothic style; the Gothic Johanniskirche of the 14th c.; and the Schloss of the former dukes. S. manufactures sewing-machines. Pop. (1875) 6784. On a plain two miles distant, October 10, 1806, the French defeated the Prussians under Prince Ludwig Ferdinand, to whom a monument has been erected on the place where he fell. See Wagner and Grobe, *Chronik von S.* (1867).

Saarbrücken, a town of Rhenish Prussia, until 1871 the nearest town of Prussia to the French frontier, situated on the left bank of the Saar, which here becomes navigable, 44 miles E.N.E. of Metz by rail. It is connected by two bridges with the town of St. Johann, and is the seat of an active industry in woollen and linen spinning, tanning, besides iron, porcelain, and tobacco manufacture. There are coal mines in the district of S. which yielded 4,403,958 tons in 1877. Pop. (1875) 9047; of St. Johann, 10,940. Here, August 2, 1870, the Germans received a slight check from the French army under Napoleon III. in person, which was revenged by a severe defeat inflicted (August 6) upon the French on the heights of Spicheren, 3 miles distant. See Köllner, *Geschichte der Städte S. und St. Johann* (Saarb. 1861).

Saarlouis, a town of Rhenish Prussia, on a peninsula formed by the river Saar, 16 miles W.N.W. of Saarbrücken by rail. It has a fortress of the second rank, erected by Vauban (1687). S. has mines of lead and iron, and manufactures leather and hardware. At Wallerfangen, near S., is a large porcelain manufactory. S. was the birthplace of Marshal Ney. Pop. (1875) 6807.

Saargemünd (Fr. *Sarreguemins*), a town of Lothringen, Germany, on the Saar, 11 miles S.S.E. of Saarbrücken by rail. It manufactures velvet, plush, red pottery, earthenware, and articles of papier-maché. Pop. (1875) 8471.

Saaz (Czech. *Zatec*), a town of Bohemia, on the river Eger, 45 miles W.N.W. of Prague by rail. Its chief buildings are the Rathhaus of 1559 and the Decanatskirche (1383). Hops are largely grown in the vicinity. S. was a stronghold of the Hussites in the 15th c. Pop. (1870) 8869.

Sabadell, a town of Spain, province of Catalonia, on the river Ripoll, 14½ miles W.N.W. of Barcelona by rail. It has 88

woollen and 20 cotton-spinning and weaving factories. Pop. 16,000.

Sabadilla, or **Cevadilla**, has been by different botanists placed as a member of the genera *Veratrum*, *Helonias*, *Schœnocalon*, and *Sabadilla*, but is now generally known as *Asagraea officinalis*—a genus established by Lindley in honour of the celebrated American botanist, Asa Gray (q. v.). S. is a Mexican bulbous plant of the Colchicum family (*Melanthaceæ*), with long narrow grass-like leaves, from among which rises a round leafless stem about 6 feet high, bearing a dense raceme of small yellowish flowers, each flower succeeded by three light-brown pointed follicles of papery consistence and about half an inch long, containing from one to three each of shining dark-coloured slightly winged seeds, which have an acrid bitter taste. The analysis of the fruit shows cevadic acid, fatty matter, veratria in union with gallic acid, gum, colouring matter, and sabadilline. Its properties are anthelmintic, stimulant, cathartic, but also highly poisonous, and internal use requires the utmost caution. In Britain it is little used on account of the dangerous nature of the drug, but in other European countries medical men prescribe it for tapeworm and ascarides, and also apply it for destroying pediculi, and as a stimulant in chronic rheumatism, neuralgia, and paralysis. The stimulating but poisonous veratria is prepared from it by maceration in water and spirit, and precipitation by solution of ammonia, &c. The actions and uses of this alkaloid are similar to those detailed above, in more concentrated form.

Sabæans is the name of three different tribes mentioned in Scripture, whose ancestors or themselves are called Sheba or Seba. 1. The S. of Job i. 15 seem to have been a Bedouin tribe in the N. of Arabia, which, according to Gen. xxv. 3, was descended from Abraham. 2. A Seba is mentioned in Gen. x. 7 as the son of Cush, along with a nephew, Sheba. Now, according to Gen. ii. 13, Cush was the country S. of Egypt on the Nile and the Red Sea. This, therefore, means that there were two closely allied Ethiopian tribes called by these names, as, indeed, it appears from Is. xlv. 14 (cf. xliii. 3) that the S. were Nubians (cf. Ps. lxxii. 10; Ezek. xxvii. 22, 23). Josephus mentions that the capital of Ethiopia (q. v.), which was afterwards called Meroë, was in the time of Moses called Saba; and Strabo, a town of the same name on the Red Sea. The principal exports of the Ethiopian ports were slaves, gold, ivory, precious woods and stones, spices, perfumes, &c. (cf. Ezek. xxvii. 15, 20; xxxviii. 13). It was the queen of this people who visited Solomon (1 Kgs. x.; cf. Jos. Ant. viii. 6, 5). 3. The S. of Yemen (Gen. x. 28) probably never attained to any great degree of wealth or civilisation. The glowing and exaggerated statements of the ancients regarding Arabia Felix clearly show that almost nothing was practically known of the country; and may be accounted for by that very ignorance itself, by the fact that its inhabitants were confounded with the Cushite S., and by statements regarding the latter being simply transferred to the former. But perhaps the confusion might be still better explained by supposing that the S. on both sides of the Red Sea belonged to the same race. At any rate, the ruins found in Arabia Felix are in the Nubian style of architecture, and it is known that that part of Arabia was often subjugated by the Nubians. See Wetzstein's Appendix to Delitzsch's *Com. on Isaiah* (Eng. trans. Edin. 1869); Strabo, xvi.; Pliny, vi. 32; Diodorus Siculus, iii. 38, 46, &c.

Sabbath (Heb. *shabbath*, said to be derived from *shabath*, 'to rest,' but perhaps originally connected with *sheba*, 'seven,' Exod. xx. 10, 11; Deut. v. 14). The division of time into weeks is one that has prevailed among nations in all parts of the world—e.g., the Hindus, Egyptians, tribes in the interior of Africa, and the Peruvians—from a very remote period, and is probably to be traced to the influence of the veneration paid to the moon, with its four phases of about seven days' duration, and the seven stars or planets generally. Those who see in Mosaism or Jehovism only a late form of the Hebrew national faith, endeavour to show that in the primitive nature-worship of the people the S. was sacred to Baal, and affirm that only with the final triumph of Jehovism was it made sacred to the new god Jehovah. They do not recognise at first any properly religious motive for the observance of the seventh day as a S. In what they consider the earliest form of the fourth commandment (Exod. xxxiv. 21,

'Six days thou shalt work, but on the seventh day thou shalt rest'), there is only a human motive. The somewhat fuller form given in Exod. xxiii. 12, exhibits exactly the same thing. So does Deut. v. 12-15; all were to rest on the seventh day, even their cattle and their slaves, because they themselves had once been slaves in Egypt. After the Chaldean account of the creation was received into the Jewish literature (probably at the period of the Captivity), the Creator's working six days and resting on the seventh was adopted as a religious sanction for the fourth commandment (Exod. xx. 11). The traditional theory of the S. utterly repudiates the notion of a Mosaism developed out of an antecedent nature-worship, and denies the validity of the criticism on which it is based.

In the Mosaic law there was a complete cycle of Sabbaths, all combined by the sacred number seven: the S. of days, the S. of weeks, the S. of months, the S. of years, and the S. of seven times seven years. 1. The great observance of the weekly S. was rest from 'all manner of work:' from all servile work on the part of slaves and hired servants, and all worldly business on the part of masters. The naturalness of making the rest on the last day of the week, after the circle of toil, is seen from the account of the creation (Gen. i.). We have seen that the measurement of time by weeks was a natural and primitive one; but the peculiar use to which Mosaism turned the seventh day was new. In renouncing on that day the gain and enjoyment to be found in the ordinary labours and occupations of the other days, there was offered to Jehovah a self-denying sacrifice. And as none of the business of ordinary life—agriculture, handicrafts, trade, &c.—could be carried on, this was all the greater a sacrifice, inasmuch as the Eastern nations were accustomed to hold their markets on their festival days, and to take advantage of the assemblies on such occasions for the purposes of trade. And this sacrifice was further sanctified because man was not to rest on the S. for his own sake alone, so as to sink into a vacant condition of inactivity, far less to give himself up to dissolute pleasures, for the sake of passing the time. On the contrary, he was to release his body and mind from all their burdens, only in order that he might devote himself to the service of God with fewer hindrances and greater purity; that he might refresh himself from the toil of the world, and have his spiritual nature elevated by communion with God.

2. *The S. of Weeks.*—This idea of the S. Moses introduced into the whole series of sacred seasons which had previously been observed by the people; the chief of which were the Spring and Autumn festivals. The first month of the year was the one whose full moon followed the Spring equinox. Seven weeks were counted from the full moon or the fifteenth day of this month, which period was consecrated to the corn-harvest; then the fiftieth day was observed as 'the festival of the (seven) weeks,' 'of the corn-harvest,' or 'the day of the first-fruits,' on which 'there was to be a holy convocation, and no servile work to be done' (Lev. xxiii. 9-21, Deut. xvi. 9-12). See PENTECOST.

3. *The S. of Months.*—Starting from the first or Passover month, the S. of the year was held on the seventh month, when the labours of the year had been accomplished. This was from the first a true national festival, the festival *par excellence*, and was celebrated with the greatest joyfulness. Its new moon was saluted with greater solemnity than that of any other month, and was exalted to the dignity of a special annual festival (Lev. xxiii. 23-25; Num. xxix. 1-6; Deut. xvi. 13-15). 4. *The S. Year, or Sabbatical Year* (q. v.), was kept every seventh year. 5. *The Year of Jubilee* (q. v.) occurred at the end of seven times seven years, or every fiftieth year.

Again, besides the weekly Sabbaths, there was a series of seven annual Sabbaths, although two of the above series are in a way included among them; (1) Two at the Passover (q. v.), the first and the seventh days of the Feast of Unleavened Bread (Lev. xxiii. 7, 8; Num. xxviii. 16-25). (2) One at Pentecost, as described above. (3) Four at the Feast of Tabernacles—the first day of the (seventh) month, or the Feast of Trumpets; the tenth day, called the Day of Atonement or the Great S.; the fifteenth, or the first day of the Feast of Tabernacles proper, and the twenty-second, or the eighth day of the feast (Lev. xxiii. 23-43, Num. xxix.). A special name given to all these Sabbaths was Holy Convocations—that is, days on which the worshippers were to be called together to the sanctuary by the sound of trumpets (cf. Num. xxix. 1).

A new era in the observance of the S. began with the return

from the Captivity, when Nehemiah restored the old laws, which would seem to have been greatly disregarded, if, indeed, some of them were not enacted then for the first time (*cf.* Neh. xiii. 15-22). Attempts were now made to 'fence about' the ordinance in a minute manner. The 'work' which before had only been generally forbidden was defined by a multitude of special precepts and prohibitions; and about a hundred years after the time of Nehemiah the S. was kept with such severity that the people would not on that day even defend themselves against the attacks of their enemies (*cf.* 2 Macc. vi. 11). But the incessant wars of the last period of the Jewish national existence, and the fact that their enemies continually seized the opportunity of the S. to gain an advantage over them (*e.g.*, this was done both by Pompey and Herod when besieging Jerusalem), rendered it absolutely necessary that the law in this matter should be relaxed. Accordingly, in this later time it came to be interpreted so as to admit of fighting on the S.; and human life was placed higher than any precept about the S. But, at any rate, all this had reference merely to work. The vulgar notion that the Jewish S. was a thing of grim austerity is altogether erroneous. 'It was precisely the contrary, "a day of joy and delight," a "feast day," honoured by fine garments, by the best cheer, by wine, lights, spices, and other physical joys; and the highest expression of the feeling of self-reliance and independence is contained in the adage, "Rather live on your S. as you would on a week-day, than be dependent on others."'*Deutsch's Remains*, p. 30.

The teaching of our Lord on the observance of the S. was liberal. 'The S. was made for man and not man for the S.' (Mark ii. 27), points it out as a privilege and a blessing. 'My Father worketh hitherto, and I work' (John v. 17), shows that, as the repose of God does not exclude a certain kind of work or activity in providing for the wants of his creatures, so the rest of the S. only requires a cessation from ordinary, everyday avocations, without rendering sinful any activity enjoined by necessity or mercy. In the early Church the S. continued to be observed by Jewish Christians, that is, specially in the Eastern Church, as a feast. It was also observed in the Western Church, but as a fast, on account of its being the time when our Lord lay in the grave. The first day of the week, the day of our Lord's Resurrection, was observed by the whole Church as a feast and for religious services; the Lord's day being at first carefully distinguished from the S. By an edict of the Emperor Constantine (321) it was enacted—'Let all judges, citizens, and artificers rest on the venerable Sun-day (*Dies Solis*). But those in the country may freely and lawfully apply themselves to agriculture, since it often happens that the sowing of corn and planting of vines cannot be so well performed on any other day, lest by neglecting the opportunity, the benefits bestowed by the divine bounty should be lost.' From this time a tendency began to manifest itself to confuse the Sunday with the Jewish S.; although the confusion was very slight till the end of the 5th c. When in 469 the Emperor Leo I. repealed the exemption made in the edict of Constantine of agricultural labourers from the prohibition imposed on citizens and mechanics, the Sunday was thoroughly established as a day of rest. From that time the tendency above mentioned, Sabbatarianism, as it has been called, rapidly increased; and the Schoolmen adopted the principle that Jewish enactments formed a precedent for Christian holy-days, and that the whole of the Jewish Decalogue was obligatory on Christians. This theory was opposed by the Reformers, although they freely acknowledged the importance of the Sunday as a day of rest and worship. The English Puritans adopted the Scholastic theory regarding the Decalogue and embodied it in the *Westminster Confession and Catechisms*. They and their descendants in England and New England, as well as the Scotch Presbyterians, have always observed the S. with an asceticism entirely foreign to the Jewish observance. The Sabbatarians or Seventh-day Baptists even thought it necessary on this principle to observe the seventh day of the week as the S. See Spencer's *De Legibus Hebr.* (Hag. 1686); Kalisch's *Com. on Exodus and Leviticus*; Heylin's *History of the S.* (1836); Hessey's *Bampton Lectures* (1860); Cox's *Literature of the S. Question* (1865); Kuonen's *Rel. of Israel* (Eng. trans. Lond. 1874-75); Ewald's *Altenthümer d. Volks Israel* (Eng. trans. Lond. 1876).

Sabbatia is a genus of N. American herbs belonging to *Gentianaceae*. *S. angularis*—the American centaury, or rose-pink of N.E. America—is used as a substitute for gentian. It

has a secondary place in the United States pharmacopoeia for its tonic, anthelmintic, and deobstruent properties. *S. stellaris* is grown as a garden flower.

Sabbatical Feasts. See SABBATH.

Sabbatical Year. As the seventh day of every week was observed among the Jews as a Sabbath (q. v.), or rest-day, so every seventh year was a Sabbath-year, during which the land was to rest, 'that the poor of the people may eat, and what they leave the beasts of the field shall eat' (that is, of course, what the land produced without tillage). It has been maintained, however, that the first form of the law in Exod. xxiii. 11—'the seventh year thou shalt let it rest and lie still'—does not bear this meaning, as the *it* does not refer to the land but to the crop, the produce of ordinary tillage, and that it was only introduced by the later writer of Lev. xxv. 4-7. It is at any rate clear that there is a new feature in this latter form of the law, for the 'increase' of the S. Y. is to be meat, not for the poor, but for the owner, his servants, strangers, and cattle, as well as the beasts of the field. Still another new feature is introduced in Deut. xv., namely, the remission of debts. See Kalisch's *Commentary on Exodus and Leviticus*.

Sabbionetta, or Sabbione'ta, a decayed town of N. Italy, province of Cremona, in the plain between the Oglio and the Po, 18 miles S.W. of Mantua. It has a citadel, a castle, and a theatre, built in 1588. Pop. nearly 7000.

Sabell'a, a genus of marine worms or *Annelida*, belonging to the order *Tubicola*, in which the animals form tubes of various materials to inclose their bodies. The tube formed by S. is of membranous or leathery consistence. It is buried in the sand, only the gills appearing above the surface. The 'blood' or pseudo-hæmal fluid in S. is of an olive-green colour.

Sabell'ius, a presbyter of Ptolemais (about 250-260 A.D.), wrote on the side of the Unitarian protest made in the 3d c. against what was considered the Ditheism and Trithelism of the Church doctrine regarding the Father, Son, and Holy Spirit. According to S., 'God, by means of the Logos, became successively Father, Son, and Holy Spirit—these three names signifying not three distinct personal beings, but three aspects or modes of the Deity, corresponding to as many periods of history,—the time of the Law, of the Gospel, and of the Church, respectively. But when God revealed himself as the Son and as the Spirit, the Father and the Son were re-absorbed into God; the monad of the Godhead is not to be confounded, as is generally done in describing Sabellianism, with the Father. Philosophically considered, Sabellianism was slightly Pantheistic; as opposed to orthodoxy, its principal feature was a denial of the distinction of persons in the Godhead, in order to substitute for them modes of being; and hence all writers fell into this heresy who tried to reconcile the idea of the Trinity with human reason by comparing the three divine persons to three qualities united in the same man. See Gieseler's *Kirchengeschichte* (Eng. trans. 1855); Reville, *Hist. du Dogme de la Div. de Jesus-Christ* (Eng. trans. Lond. 1870).

Sab'icu, also called **Sav'icu-wood**, a shipbuilding wood of Cuba, the produce of *Lysitoma S.*, a large leguminous tree allied to *Acacia*, and confined to that island. The wood is very heavy, hard, and durable. For these qualities it was selected to construct the stairs of the Crystal Palace in the Great Exhibition of 1851.

Sab'ine, General Sir Edward, K.C.B., F.R.S., was born at Dublin, 14th October 1788. As captain in the Royal Artillery he took part in the American campaign of 1814. He accompanied Ross and Parry in 1819 to the Arctic regions, and by close study of magnetic phenomena greatly increased our knowledge of terrestrial magnetism. His results were given in two papers before the Royal Society; and his interest was so aroused in this branch of physical science that in 1821 he commenced a series of voyages to places between the equator and the arctic circle, determining at every convenient point the amount of dip and declination and the length of the seconds' pendulum. The results of these investigations were published in 1825. Excepting a brief period of military service in Ireland, when he rose to the rank of major, his subsequent career was wholly devoted to science. He continued his observations on magnetic variation, and organised a complete system of magnetic observations at home and in the colonies. He was president of the British Association

in 1853, president of the Royal Society in 1861, was made a Knight Commander of the Bath in 1869, and was elected a corresponding member of the French Academy in 1875. His memoirs and papers are for the most part published in the *Philosophical Transactions* and the *British Association's Reports*. He edited his wife's translations of Humboldt's *Kosmos* (1846); *Ansichten der Natur* (1849), and Arago's *Essais Météorologiques* (1855).

Sabine River, a river of the United States, rises in Texas and flows S.E., then turning S. it forms for 250 miles the boundary between Texas and Louisiana, and enters the Gulf of Mexico at Sabine Lake. The S. is 500 miles long and navigable in its lower course. Much timber is shipped from the valley.

Sabi'ni, one of the most important of the early Italian tribes, from whom the Samnites, Lucanians, Bruttii, &c., were offshoots, occupied a mountainous strip of territory in Central Italy about 80 miles long, between the Nar and the Anio. The S. seem to have been generically of the same stock as the Oscans, but the Romans magnified their differences in origin, character, and language. The ancient Roman myth makes them one of the constituent elements of the Roman city, and in their function of giving a religious system to the state they were personified in Numa Pompilius. Frequent wars are recorded between the Romans and S. till 449 B.C. when M. Horatius seems to have crushed them. Though seldom mentioned after their incorporation with Rome (268 B.C.), they retained their individuality, and their land is still called *La Sabina*. Like most mountaineers, they were hardy, frugal, and brave, and did not congregate in towns. Wine and oil were raised in abundance from their fertile valleys. See **ROME**.

Sable (*Martes zibellina*), a species of mammal, belonging to the order Carnivora and to the weasel family (*Mustelidae*). It occurs in the N. of Europe and Asia, its capture forming an important industry. The fur is amongst the most valuable of this class of products, and is heaviest during the depth of winter. In colour it is of a very deep rich brown, exhibiting grey tints in the neighbourhood of the back and neck. The tail is bushy. The average length of the animal is about 18 inches. The S. burrows in the ground, or may construct its nest in trees. It is wary and active, and its capture (chiefly by traps) is, therefore, a matter of great difficulty. The young are born in March and April, and from four to five young are produced at a birth. Other species of S. are the Japanese S. (*M. melanopus*), and the N. American S. (*M. leucopus*). The value of a skin of the Russian S. ranges from two to ten guineas, the finest being dark in colour. Most of the skins are sold in Russia, but over 7000 are annually imported into England. The Tartar S. is the *M. Siberica* of naturalists, whilst the name Hudson's Bay S. is given to the *M. Canadensis*, otherwise named the Pekan or Wood-Shuck of N. America.

Sable, in heraldry, the tincture or colour black, represented by vertical and horizontal lines crossing each other.

Sables D'Olonne, Les, a small seaport and watering-place of France, department of Vendée, 67 miles S.S.W. of Nantes by rail. Its harbour receives vessels of 200 tons, and it has a considerable export trade in corn, wine, wood, salt, cattle, and fish. Pop. (1876) 9188.

Sabot (Fr. *sabot*), a wooden shoe extensively worn by the lower classes of France and Belgium. Common sabots are made of beech, willow, or Lombardy poplar, and finer kinds of walnut and other expensive woods. Beech sabots are less pervious to water than the other kinds. They are roughly shaped while the wood is yet green, and set aside to season for several months. Sometimes the drying and seasoning are hastened by exposing the sabots to the heat and smoke from fires of beechwood chips; this measure imparts a brown colour to the wood and preserves it from insect ravages. After drying, the exterior is pared and smoothed, and the interior scooped out to a certain gauge. The shoes are frequently carved and painted black.

Sabotière (Fr.), an apparatus for making confectioners' ices. It consists of an outer fixed pail of wood, and an inner movable vessel (*sabotière*) of metal, the space between the two being filled with a freezing mixture. The cream to be iced is placed in the S., and by means of a handle it is rocked or rotated for several

minutes till the cream is frozen. In large ice-cream manufactories a number of sabotières are fitted up and connected with strap-gearing, by means of which simultaneous motion is transmitted to all.

Sabre (Fr.), a heavy one-edged sword, curved towards the point, used principally by cavalry.

Sabre-tache, an ornamental leather case suspended at the left side of the sword-belt, worn by all mounted officers of the British army.

Sabri'na Land, an Antarctic region of unknown extent, in 70° S. lat., 120° E. long., discovered by Balleny in 1839.

Sac'charic Acid (C₆H₁₀O₆), a non-crystallisable deliquescent acid, produced by the action of nitric acid on sugar. It is soluble in water and alcohol, and combines with bases to form crystalline salts.

Saccharom'eter, an instrument for measuring the strength of saccharine solutions. There are two perfectly distinct forms, the one being simply a hydrometer for taking the specific gravity of the solution, and the other a form of polariscope. The latter is so arranged that the solution may be interposed between the polariser and analyser, and by observing the angle through which the plane of polarisation is turned in passing through the solution, the datum is given for the calculation of the strength. See **POLARISATION**.

Sac'charum. See **SUGAR-CANE**.

Sac'charum Lac'tis, or **Sugar of Milk**, a crystallised sugar obtained from the whey of cows' milk by evaporation, is prescribed as a non-nitrogenous article of diet in certain pulmonary diseases, and in cases of great irritability of the stomach. Dissolved in water, and mixed with cows' milk, it forms a good substitute for that of the mother. Dose, 60 to 120 grains, or more, in water.

Sacchi'ni, Antonio Maria Gasparo, one of the most popular of the older Italian operatic composers, was born July 23, 1734. His works include 38 operas, 5 oratorios, and much church and instrumental music. At the time of his death, October 7, 1786, he was the idol of the Parisian public. Though his compositions are now almost obsolete, his free and happy style and rich instrumentation had a powerful effect upon his art, and live in the works of many of his successors. See *Fétis, Biogr. Univ. des Musiciens* (new ed. 1878).

Sacheverel, Henry, was born at Marlborough in 1672. His grandfather had been a Dissenter, but his father was rector of St. Peter's Church, Marlborough, and a strong High Churchman. S. was educated at Magdalen College, Oxford, where he made the acquaintance of Addison, and wrote some Latin poems of little merit. He graduated M.A. in 1696, and after holding for some time a benefice in Staffordshire, was in 1705 made preacher at St. Saviour's, Southwark, London. In 1707 he took the degree of D.D., and the year following was promoted to D.D. In 1709 he preached the two sermons which have made him famous—one at the Derby Assizes, the other before the Lord Mayor in St. Paul's. In these sermons S. maintained the doctrine of Non-resistance to the regal authority, declared that the Church was in danger, and called upon the nation to suppress Dissent. His sermons were printed, and 40,000 copies were soon sold. Popular feeling ran high in his favour. Queen Anne was on his side. The whole Tory party supported him. Unwisely for themselves, the Government resolved to impeach him. He appeared before the House of Lords in 1710, and was found guilty by a majority of 17. He was suspended for three years, and his sermons were publicly burned. Great excitement ensued; raising the cry of 'the Church and Dr. Sacheverel!' the mob wrecked meeting-houses, and burned the effigies of the leading Whigs. A general election soon followed, and was fatal to the Government. When in 1713 S.'s suspension expired, he received an ovation. He preached before the House of Commons, and made a triumphant progress to a benefice in Wales. He soon, however, sank into oblivion, except in 1718, when he was temporarily suspected of aiding the Jacobite Rebellion. He died June 5, 1724. S. was, according to all accounts, a vain and shallow man, though with some versatility and address. But from the historical importance of the questions involved in his trial, and the extraordinary popular excite-

ment he kindled, a certain interest will always attach to his name. See Burnet's *History of His Time* (vol. ii.); Swift's *Journal*, &c.; *History of the Reign of Queen Anne*, by Hill Burton.

Sachs, Hans, a famous German *meistersinger* of the 16th c., was born at Nürnberg, 5th November 1494. His father was a tailor, and he was trained to the trade of a shoemaker. He served his apprenticeship in his native town, where, at the same time, he managed to acquire the rudiments of a classical education at the Latin school. In 1570 he started, according to the custom of his time, on a series of travels, working at his trade in Regensburg, Passau, Salzburg, &c. At Innsbruck he entered the hunting-train of the Emperor Maximilian, and here his love of meistersongs was awakened. Again he travelled, visiting (1513) Munich, Würzburg, Frankfurt-am-Main, &c. At Munich under his fellow-townsmen Nunnenbeck, and at Frankfurt, he studied in the *singschulen* of the meistersingers. Returning home in 1515, he worked at his trade, at the same time diligently cultivating his art. S. married in 1529 Kunegunda Kreuzer, and continued for some time to prosper peacefully and steadily. The excitement of the Reformation disturbed his calm. He sympathised warmly with Luther. A poetical tale called *Die Wittenbergisch Nachtigal*, a short poem called *Wachet auf, es nahet gen dem Tag*, and a series of dialogues, had appeared by 1523. The influence of these and numerous other fugitive pieces was very great, not only in his native town of Nürnberg, which declared for Protestantism, but all over Germany. S. wrote also plays, which were at the time successful, numerous *Schwänke* or merry tales, and some songs. His wife died in 1560, but next year he married again. In 1562 the outbreak of the plague brought him once more prominently before his townsmen as an adviser and friend. He died, 25th January 1576, at the age of eighty-two. S. was a real genius, and his writings had a strong and lasting effect on Germany. He helped to make his mother-tongue a literary language. He introduced a new era for German poetry, and revolutionised the drama. Before his time the artisan guilds had composed mysteries and carnival farces. S. increased the number of personages, introduced better scenery, and worked many radical changes. He was an intense patriot. Many of his poems were exhortations to self-abnegation and public spirit. He was a keen satirist, but although the intense humour and gay irony of his *Schwänke* were coloured by the prevailing coarseness, he never sank to personality or abuse. When sixty-three, S., believing his vein of poetry to be worked out, ceased to publish fresh pieces, and proceeded to collect his writings. The standard edition appeared at Nürnberg (1558-79) in 5 vols., and includes 80 tragedies, 52 comedies, 64 farces, several thousand *Meistergesänge*, *Schwänke*, &c. During the 17th and greater part of the 18th centuries S. was almost entirely forgotten, but in 1776 Goethe's poem, *H. S.*, revived his memory, and since then he has again received the affectionate study he so well deserves. At Zwickau, in 1853, 13 volumes of his MSS. were discovered; others have been found at Dresden and Göttingen. A collected edition of his works was begun at Stuttgart in 1870. There is a good selection by Goedeke (3 vols. 1870-72). See Hofmann, *Hans S. seine Leben und Wirken* (Nürnberg 1847); and Neumann, *Über einige Handschriften von Hans S., nebst ungedruckten Gedichten* (Leip. 1843). There is also a later (1868) work by Weller.

Sachsen, the German form of *Saxony* and *Saxe*. The kingdom of S. is treated under the more familiar heading SAXONY, but the Prussian province and the minor states under their proper German designation.

Sachsen, a province of Prussia, bounded on the E. by Brandenburg, on the S. by the kingdom of Saxony and the minor Saxon duchies, on the W. by Hessen-Nassau, Braunschweig, and Hannover, on the N. by Hannover and Brandenburg. Area, 9740 sq. miles; pop. (December 1875) 2,168,988. It is divided into the three districts of Magdeburg, Merseburg, and Erfurt. About 93 per cent. of the population are Protestant. Education is highly advanced, only 322 per cent. of the recruits enrolled being unable to read and write. S. is interspersed by detached portions of other districts and by the province of Anhalt, which almost divides it into two parts. It is very irregular in shape in consequence of having gained accessions by conquest at various times. The S. portion of the province is

mountainous, but the rest is level. The chief rivers are the Elbe and its tributaries, the Black Elster, Mulde, Unstrut, Bode, and Saale. The country is very fertile, especially in the valleys of the Mulde and Saale, and in the *Goldene Aue*. Forest occupies 20 per cent. of the entire area. The province contained in 1875, 164,311 horses. It is rich in minerals—silver, iron, lead, copper, coal, lignite, clay, and various salts. The industries are cotton, linen, and woollen manufactures; oil-mills, chemical works, glue-boiling works; also vinegar, chocolate, and chicory manufactures. S. produces 5000 tons of paraffin and 15,000 of lamp oil annually. The capital of the province is Magdeburg (122,000). Halle, Erfurt, Halberstadt are next in importance. The University of Halle, founded in 1694, has 104 professors and teachers, and 827 students (1878).

Sachsen-Altenburg, the most easterly of the Saxon duchies, is divided by Gera into two parts, the 'Ostkreis,' watered by the Pleisse, and the 'Westkreis,' forming part of the valley of the Saale. Area, 516 sq. miles; pop. (1875) 145,844. The W. is hilly and two-fifths forest; in the E., which is very fertile, cattle-rearing and tillage are in an excellent condition, and the peasantry are the best-off in Germany. There are manufactures of wool, gloves, porcelain, delf, and wooden wares. By the law of 29th April 1831 (modified in 1848 and 1849), S.-A. is a constitutional hereditary monarchy. Its internal affairs are managed by a diet of 30 deputies. To the German Confederation it sends one member; to the Imperial diet, two. The budget of 1875-77 shows a revenue and expenditure each amounting to £111,178. In 1877 the public debt was £456,887. The S.-A. territory belonged originally to the markgräfdom of Meissen, and in 1482 fell to the Ernestine line; was in 1547 given to the Albertine, but returned to the former in 1553. It had dukes of the elder Weimar line from 1603 to 1672, when it came to the line of Gotha, with which it was connected down to 1826. It was then made an independent duchy for Duke Friedrich of Hildburghausen (died 1833), who ceded it to Meiningen. In 1848 Duke Joseph abdicated in favour of his brother Georg, whose son Ernst (born 1826) has ruled since 1853. S.-A. joined the Zollverein in 1834, and the North German Confederation in 1866. See Topfer, *Landeskunde von S.-A.* (1867).

Sachsen-Koburg-Gotha, a duchy of the German Empire, comprises the former duchy of Gotha (area 542 sq. miles), bounded by Preussen, Schwarzburg, Meiningen, and Hessen, with two detached portions included in Preussen; and that of Koburg (area 214 sq. miles), lying S. of Gotha, and bounded by Meiningen and Bayern, with a detached portion in Bayern. Pop. (1875) 182,599 (Gotha, 128,092; Koburg, 54,507). The Thüringerwald intervenes between the two duchies, and its spurs render the southern portion of Gotha mountainous and broken in surface, while the whole of Koburg is hilly in its formation. The northern portions of Gotha, on the other hand, are level or undulating. The Werra, a tributary of the Weser, and the Unstrut, a tributary of the Saale, flow through Gotha, while Koburg is watered by the Itz and Rodach, tributaries of the Main. The duchies are almost entirely agricultural, and are farmed with industry and skill. Of the whole surface 68 per cent. is cultivated, 30 per cent. is forest-land, and only 2 per cent. waste. Wheat, rye, barley, oats, and flax, as well as potatoes, beet-root, &c., are extensively grown, and there is a large production of garden-vegetables and fruit. Cattle, sheep, and goats are reared in considerable numbers. Iron, coal, copper, cobalt, and manganese are found, principally in Gotha, and there are also marble quarries and salt mines. There are some hardware and porcelain manufactures in Gotha. Glass-works and toy-manufactories are common, and there is a great manufactory of tobacco-pipes at Ruhla. The Thuringian railroad runs through Gotha, and the Werra railroad through Koburg. The capitals are Gotha (q. v.), and Koburg (see COBURG).

A common constitution was promulgated 3d May 1852, by which each duchy has a *Landtag*, Gotha of 19 and Koburg of 11 members, from whom a common *Landtag* is chosen, consisting of 14 of the former and 7 of the latter, to deal with matters affecting the whole state. The military force of the duchies forms, along with that of Sachsen-Meiningen, the 6th Thuringian infantry regiment. The budget is voted for four years, and a distinction is made between crown and state revenue. In the budget for 1877-81, the annual revenue and expenditure of the crown were stated at £124,285 and £74,395 respectively, leaving a surplus of £49,890; the state revenue and expenditure for the same years

being £168,549 annually. The public debt amounted in 1877 to £85,175. There are 230 elementary schools in the duchies, and 9 higher institutions. The population is almost entirely Protestant. Both duchies belonged to the Ernestine branch of the house of Sachsen. The founder of the present line was Johan Ernst, seventh son of Ernst the Pious. The present duke, Ernst II., who ascended the throne in 1844, is a younger brother of the late Prince Consort, whose second son, the Duke of Edinburgh, is heir-apparent to the throne. The ducal house is also allied to the royal families of Belgium and Portugal.

Sachsen-Meiningen (called also *S.-M. Hildburghausen*), next to Sachsen-Weimar-Eisenach, the largest of the Saxon duchies, consists of the ancient duchy of Meiningen with the principalities of Hildburghausen and Saalfeld, and lies in the form of a semicircle S.W. and S.E. of the Thüringerwald. Area, 953 sq. miles; pop. (1875) 194,494. The surface is mountainous, the highest points being Blessberg (2825 feet), Kiefernle (2878 feet), and Gebaberg (2466 feet). It is abundantly watered by the Werra, which traverses the whole duchy, the Saale, Itz, Rodach, Milz, and Steinach. Of the soil, 44.2 is arable, 39.5 wood, 12.8 meadow-land, and 2.3 in gardens. The chief crops raised are grain, tobacco, potatoes, hemp, and flax. In the E. are productive mines of copper, iron, coal, cobalt, sulphur, salt, and porcelain-clay. Active manufactures are carried on of cottons, woollens and linens, cast and wrought iron wares, glass, porcelain, beer, paper, and wooden toys, the last being chiefly carried on at Sonneberg. S.-M. is a constitutional and hereditary monarchy. The reigning line springs from Duke Bernhard, third son of Ernst I. of Sachsen. The Diet consists of 4 deputies of the large proprietors, 4 of the largest taxpayers, and 16 deputies of the people. S.-M. sends two deputies to the Imperial Diet. The budget for the three years 1875-77 shows a revenue of £211,182, and an expenditure of £189,682. The civil list amounts to £19,000, and the public debt on January 1st, 1876, was £632,910.

Sachsen-Weimar-Eisenach, the smallest German grand-duchy, consists of three main districts—Eisenach in the W., Neustadt in the E., and between these Weimar—besides numerous smaller portions. Area 1403 sq. miles; pop. (1875) 292,933. The N. is undulating country; the middle belongs to the Thüringian Forest, and the S.E. is part of the Voigtland. The chief rivers are the Saale in the E., and the Werra in the W. One-fourth of the surface is forest. The chief products are wheat, oats, fruit, flax, wine, and oil; the industries, tillage, cattle-rearing, wood-cutting, and the manufacture of linens, woollens, cottons, leather, paper, and metal-ware. Iron, coal, and salt are found. The University of Jena is common also to the three Saxon duchies. By the law of the 15th October 1850, S.-W.-E. is a constitutional hereditary monarchy. The diet has 31 deputies, and sends to the German Confederation one member, and to the Imperial Diet three. The budget for 1878-80 states the annual receipts at £338,340, and expenditure at £336,884. The public debt in 1877 was £407,025. The line of S.-W.-E. was founded in 1640 by Wilhelm, third son of Johann III. of Weimar. Its possessions, divided into three in 1672, were re-united under Ernst August (1741), whose grandson, Karl August, was the famous patron of literature. In 1815 S.-W.-E. was made a grand duchy, and was augmented by 659 sq. miles, with a pop. of 77,000. In the crisis of 1866 it declared for Prussia, but its troops, lodged in Mainz, were held in inaction by the Austrians and Bavarians. See Schütz, *Staatsleben des Großherzogthums S.-W.-E.* (Weim. 1859).

Sack, a large bag made for holding and transporting grain, flour, and other substances generally in a condition of comparatively fine division. Grain and flour sacks or bags being made of a uniform size, generally are filled with definite weights of these substances; hence a S. has come to be a recognised weight = 280 lbs. of flour. Sacks are largely made in Dundee of tow or jute sacking-cloth, and an 'overhead' sewing-machine has been invented for sewing their sides.

Sack (Old Fr. *sec*, Span. *seco*, 'dry,' from Lat. *siccus*), a name attached to a variety of wine during the Elizabethan period, and which continues to be known to the present day chiefly by the esteem in which it was held by Sir John Falstaff and his associates. It was probably a dry sherry.

Sackbut. The Greek *sambyke* was a large harp, and the instrument called sackbut by the translators of the Bible (Dan. iii.) was probably similar. The old English sackbut was an instrument like the trombone.

Sackville, Thomas, Lord Buckhurst and Earl of Dorset, son of Sir Richard S., was born at Buckhurst, Sussex, in 1536. He entered Hart Hall, Oxford, in his fifteenth or sixteenth year, afterwards took his degree at Cambridge, and was called to the bar at the Inner Temple. His poetical reputation had been established before he left college, but none of his early productions remain to us. At nineteen he married the daughter of a privy councillor, and at twenty-one he sat for Westmoreland in the Parliament of Mary. About this time he formed the plan of writing a series of poems as sequel to Lydgate's *Falls of Princes*, but all he accomplished was the *Induction*, and the *Complaint of Henry Stafford, Duke of Buckingham*. The *Myrror for Magistrates*, a series of metrical biographies, written by Baldwin and others, was first published in 1559. S.'s *Induction* and *Complaint* appear only in the second edition of 1563. But what he contributed to the *Myrror*, besides giving a basis of the work, is immeasurably its noblest part. The *Induction* displays a rich, sombre, and potent imagination. It was the first piece of vivid poetry in England since the death of Chaucer, and its allegorical descriptions are scarcely inferior in graphic force and beauty to those of the *Fiery Queen*. In 1561 S. joined Thomas Norton, also of the Temple, in providing a play for the recreation of the Templars, entitled *Ferrex and Porrex*. Of this play, the plot taken from Geoffrey of Monmouth's *History of the British Kings* is of the simplest description; the language is heavy and the versification monotonous; but it forms the first true specimen of our dramatic literature; and its use of Surrey's blank verse was the result of a happy instinct. A spurious edition of it appeared in 1575 under the following title—*The Tragedie of Gorboduc, whereof three Actes were written by Thos. Norton, and the two last by Thomas Sackwyll*. In 1571 the authorised edition appeared in blackletter, with the title of *Ferrex and Porrex*, but the play was afterwards known by the name of *Gorboduc*. S. was long a member of Parliament in Elizabeth's reign. Soon after his father's death he was created Lord Buckhurst; in 1571 he was sent as an ambassador to France; in 1586 was one of the commissioners who tried Queen Mary; in 1591 he was elected Chancellor of the University of Oxford; in 1598 he succeeded to the office of treasurer Burleigh; and in 1601 he sat as lord high steward at the trial of Essex and Southampton. On the accession of James I. he was named lord high treasurer for life, and created Earl of Dorset. He died suddenly in the council chamber at Whitehall, April 19, 1608, and was buried in Westminster Abbey. See the edition of his Works by R. W. Sackville-West (Lond. 1858), and the *Memoir* by W. D. Cooper in his edition of *Gorboduc* printed for the Shakespeare Society. The *Induction* is printed along with Surrey's *Poems* in Bell's 'Edition of the English Poets.' It is also given in Skeat's *Specimens of English Literature*, A.D. 1394-1579 (Oxf. Clar. Press, 1871).

Sackville, Viscount, a soldier and statesman of the reigns of George II. and III., was the third son of the first Duke of Dorset. He was born on January 26, 1716, and entered the army under the title of Lord George S. At Dettingen (1743) and Fontenoy (1745) he served with credit, and obtained the rank of colonel at Culloden (1746). He subsequently became a privy-councillor, and was secretary for Ireland in 1751. At the Battle of Minden (1759) he was in command of the allied cavalry, and, refusing either from cowardice or jealousy to obey the order to charge given him by Prince Ferdinand of Brunswick, he saved the French army from annihilation. On this charge he was tried by court-martial, and adjudged incapable of serving thereafter in any military capacity. George II. struck his name off the list of privy-councillors, and for eight years he lived in retirement and disgrace. In 1770 he inherited the property of Lady Elizabeth Germain, and assumed her name. The cloud under which his questionable conduct had placed him gradually dissolved, and having been noted for his opposition to the claims of the American colonists, he became in 1775 Secretary for the Colonies in Lord North's ministry, and carried on the American War, with what success is well known. He retired from office in 1782, and was created V. S. and Baron Bolebrook. He died on August 26, 1785, and his eldest son afterwards became Duke of Dorset.

The *Letters of Junius* were at one time very commonly attributed to S., but this theory seems now to be abandoned.

Sa'oo, a town of Maine, U.S., on the S. River, near the famous 'Great Falls,' 100 miles N.N.E. of Boston by rail. It has 6 churches, 4 banks, a large library, and one weekly newspaper. It has also large cotton manufactories and some shipping, and is the scene of Methodist national camp-meetings. Pop. (1870) 5755.

Sac'rament (Lat. 'something sacred'), in ecclesiastical usage meant (1) anything sacred or consecrated, and (2) anything which had a sacred or hidden meaning, as rites and ceremonies. (3) In this sense it was connected with the Greek *mysterion*, which properly means a secret, something into which a man had to be initiated, and for which it is used as an equivalent in the Vulgate, e.g., in Eph. i. 9, &c. In Christian theology various definitions of a S. were framed. Two of the simplest and most expressive of the older ones were those given by Augustine and Peter Lombard: 'A word is added to an element, and a S. is made,' and 'A S. is a visible form of an invisible grace.' The definition accepted is of importance, because on that depends the number of S. held by the various churches. Thus the definition given in the Roman Catechism is 'A thing subject to the senses, which by the institution of God has the power both of signifying and of producing holiness and justice.' Accordingly, in this wide sense, the Church of Rome has seven sacraments—Baptism, Penance, the Mass, Matrimony, Orders, Confirmation, and Extreme Unction. According to the Westminster Catechism, with which all the other Protestant symbols substantially agree, 'A S. is a holy ordinance instituted by Christ; wherein, by sensible signs, Christ and the benefits of the new Covenant are represented, sealed, and applied to believers.' The only two ordinances which answer the terms of this definition are Baptism and the Lord's Supper, which, accordingly, are the only two sacraments observed in the Protestant churches.

Various opinions are also held regarding the efficacy of the S. The Church of Rome holds (1) that the efficacy common to all sacraments has (in the case of Baptism, Orders, and Matrimony) an indelible character, (2) that they convey the grace which they signify 'ex opere operato,' and (3) that the conditions of their efficacy (a) on the part of the administrator, are that he have authority in the case of baptism, and the intention of doing what the Church intends to be done, and (b) on the part of the recipient that he do not oppose an obstacle. The Lutheran Church holds (1) that the efficacy of the sacraments is due to their own inherent virtue; but (2) that faith is absolutely necessary to any real benefit being derived from them. The doctrine of the Reformed churches is (1) that the sacraments are real means of grace, but (2) that they become so 'not from any virtue in them or in him that doth administer them, but only by the blessing of Christ and the working of his Spirit (3) in them that by faith receive them.' See Hodge's *Syst. Theol.* (Edin. 1873).

Sacramentarians was the name given by the Lutherans to the party who opposed the Lutheran doctrine of the Real Presence (q. v.), or of Consubstantiation (q. v.), maintaining that the presence of Christ in the Eucharist was only spiritual or sacramental. The leader of the S. in North Germany was Karlstadt, the colleague of Luther, with whom, in the controversy which began about 1524, sided many of the people and several of the leading divines; although some of the latter, e.g., Bucer and Capito, tried to diminish as much as possible the difference between Karlstadt and Luther. Ecclampadius and other divines in South Germany, as well as Zwingli and most of the Swiss, substantially sided with Karlstadt, and although the controversy subsided after the death of Ecclampadius and Zwingli (1531), it was the means of producing the two great parties among the Protestants of Lutherans and the Reformed. See Mosheim's *Church History* (Reid's ed. Lond. 1860).

Sacramen'to, the capital of the State of California, U.S., stands on the left bank of the S. River, at its junction with the American River, 135 miles N.E. of San Francisco by rail. It is at the head of navigation for large steamboats, and is regularly laid out, on a flat plain only 30 feet above the sea-level. S. has numerous churches and public schools, three newspapers, and is the centre of a large mining, wheat-raising, and agricultural region. It has woollen manufactures, and large carriage, furniture, and agricultural-implement making industries, as well

as railway workshops employing 1500 operatives. The State Capitol, a handsome building erected at a cost of \$2,500,000, is situated at S. Great damage was done to the city by floods in 1853 and in 1861; but in 1862 substantial levees were constructed, and the chief streets and buildings were raised 8 feet. The climate is almost tropical, but the nights are always cool and pleasant, owing to the sea-breezes. The pop. in 1849 was estimated at 150, in 1853 at 12,000. In 1870 it was 16,283, and in 1876 it was estimated at 20,000. The school census of 1875 returned 6878 children under seventeen years of age, of whom 150 were Chinese.

Sacramen'to River, a river of California, U.S., rises in the Sierra Nevada, flows westward past Mount Shasta, and then southward through a broad and fertile valley, a northward extension of the great San Joaquin valley. It is 500 miles long, and is navigable for steamers for 50 miles from its embouchure in Suisun Bay, and for small vessels as far as Red Bluffs, 320 miles.

Sac'ed Heart of Je'sus, The Feast of, observed in the Roman Catholic Church on the Friday after the Octave of Corpus Christi (q. v.), originated in a vision seen by Marguerite Marie Alacoque, a nun at Paray la Moniale, in 1675. The special devotion henceforth paid to the Sacred Heart was approved by Popes Clement XII. (1732 and 1736), and Clement XIII. (1765). Pope Pius VI. granted to all who should, with contrite heart, visit a picture of the Sacred Heart and there offer certain prayers, an Indulgence of seven years; and Pius VII., to all who should offer a daily prayer to the Sacred Heart, two Plenary Indulgences every month, the Indulgence of seven years on the four Sundays before the feast of the S. H. of J., and of sixty days for every good work, and a Plenary Indulgence at death. See Tickell's *Life of Blessed Margaret Mary* (1869); Garside's *Blessed Margaret Mary Alacoque* (1874).

Sac'ed Mu'sic. The alliance of music with religion is probably nearly as ancient as the art itself. The Egyptian priesthood cultivated sacred music; and the religious music of the Hebrews, possibly derived from this source, is often referred to in the Old Testament. David appointed a great corps of musicians, and wrote his Psalms for alternate choirs, while a considerable variety of instruments were used in the Temple service. It is safe to assume that grandeur of effect was more successfully aimed at by the Jews than beauty of style and harmony. The Greeks, who were doubtless more scientific in their treatment of the art, assigned a prominent place to it in their religious celebrations; though almost all that we know of ancient practical music has been transmitted to us through the services of the early Christian Church. Here chanting and the singing of Greek and Hebrew melodies, so simple that the whole congregation might join in the service, seems to have been the practice until the first Council of Laodicea, after which the singing was almost entirely left to the clergy and trained musicians. St. Ambrose and Pope Gregory I. gave a fixed constitution to church music, so far as it related to chanting. The venerable Gregorian Chant (q. v.), still exclusively used in the Roman Communion on certain occasions, particularly during the penitential season of Lent, has lately come into high favour among the High Church party of the Church of England. The services at the court of Hlodwig, King of the Franks, are said to have been rendered by a fine choir of singers and instrumentalists. The rise of the organ dates from the 8th c., and in the 10th c. it was extensively used in different parts of Europe. After the introduction of counterpoint, church music became more elaborate and showy, with a strong admixture of profanity. Airs frequently taken from French chansons and other secular sources, and turned and twisted to display the skill of the composer or performer, were frequently sung in holy places. The Council of Trent therefore deliberated on the means of suppressing music in churches, and Pope Marcellus II. had decided to reduce it to the simple Gregorian chant, when the noble Masses of Palestrina, the great reformer of church music, initiated a more solemn and lofty style. Since the time of this composer the Mass has been treated in a recognised and definite manner, and many of the greatest composers—Haydn, Mozart, Beethoven, Schubert, Weber, Rossini, Gounod, &c.—have embellished this branch of S. M. by some of the most sublime efforts of their genius. The origin of the Oratorio (q. v.) is ascribed to Filippo Neri.

With the Reformation a new form of S. M. was born in Germany. Translations of the Psalms and spiritual songs were

set to chorales, and these *Geistliche Lieder* took firm root in the hearts of the German people. Many, such as *Ein Feste Burg* (Luther's Hymn) and *Nun Danket alle Gott*, have to this day the sacredness of national anthems. Sung in unison by the entire congregation, their effect is grand in simplicity. The chorale has been treated in a masterly manner by Bach in his *Passion Music* (q. v.), and more recently by Mendelssohn in his oratorios. It is the forerunner of the modern Hymn (q. v.), which forms so large an element in the S. M. of Protestant countries such as Germany, England, and America.

Various collections of psalm tunes appeared in England prior to Ravenscroft's *Whole Book of Psalmes*, published in 1621. Andrew Hart's *Scotch Psalter*, containing the Psalms of David with melodies, was published at Edinburgh in 1615. In the services of the Church of England, the Psalms according to the prose version of the Prayer-book are chanted. The Anglican chant is of two kinds. The first, single, has two strains, one of three bars and one of four; the second, the double chant, is twice the length of the first. Each verse is divided into two parts; one of which, whatever the number of words, goes to one strain in the chant. In cathedrals and churches where there are choirs the choristers are divided into two bodies, who chant the verses alternately. Various parts of the service, particularly the Te Deum (q. v.), the Communion Service, and the Anthem (q. v.), are of a more ambitious musical character.

The Dissenters of England, and even to a greater extent the Presbyterians of Scotland, were long opposed to any but the plainest music in their services. Till a very few years ago the use of the organ was violently denounced. The result in Scotland has undoubtedly been to retard the musical progress of a people naturally gifted with a love of the art. With a trained organist and choir in every parish, there must always be a more widely-spread musical culture. This prejudice in the North is now, however, on the wane, and a more moderate feeling begins to prevail. The organ is rapidly establishing itself in the church as a legitimate musical instrument.

Sacrifice (Lat. *sacrum*, and *facio*) is the act of dedicating something to a deity, or the thing which is dedicated. It has been suggested by a great variety of causes, and expresses a great variety of notions. 1. As, in dealing with his fellow-men, man seeks to express love and gratitude to his benefactors, as well as to propitiate the anger of those he fears and avert their ill-will by bringing gifts, he acts on the same principle in dealing with the deities whom, as it happens, he loves or fears. Among a primitive people it is not thought to be right to approach a deity, any more than a prince, empty-handed. The first offerings or gifts of this kind would naturally be of the fruits of the ground, as a token of gratitude to the god of fertility. But afterwards animals and even human beings came to be offered. (1) When a tame animal was slain for food, it seemed fitting that the sanction and the blessing of the Giver of all life should be asked. In this light the killing came to be regarded as a religious act, and the butcher to be identified with the priest, who was rewarded for his services by a portion of the slain beast. Thus in the Mosaic Law every animal, though its flesh were intended for domestic use, had to be brought to the sanctuary to be slain by the priest as a thank-(peace-) offering (Lev. xvii. 3-5). (2) From this it followed that, as the life of every animal killed for food was offered to the deity, the blood, in which the life was supposed to be, could not be eaten. Closely connected with this was the notion that the deity himself had pleasure in the blood which was poured out at the altar, and partook of the S., especially by the smell of the roasting flesh (cf. Gen. viii. 21). (3) As the perquisite of the priests was a part of the animals sacrificed, it was their interest to urge sacrifices as a religious duty, that is, of such animals as were considered fit for human food; and to ensure a regular supply it came to be enacted that the first-born of all such animals (at any rate the males) should be 'given to God.' In the most primitive times the rule that the first-born should be offered to the Giver of life included even the first-born of man, as well as of animals. This was especially the case among the Semitic tribes of the W. of Asia (cf. Ex. xiii. 2, 11-16; xxi. 29, 30; Lev. xxvii. 26; Deut. xv. 19, 20).

Human sacrifices certainly formed a part of the regular worship of the gods of the Moabites and Ammonites, Chemosh and Milcom or Molech; and as this part was not omitted by the

Israelites when the worship of these deities was practised in Israel, even at a late period (cf. 2 Kings xvi. 3; xxi. 6; xxiii. 10; Is. lvii. 5; Jer. vii. 31, xix. 5, &c.), so there is reason to believe that originally it formed a part of the worship of their own national god Jehovah (cf. Ex. xiii. 2, 11-16; xxii. 29, 30; Lev. xxvii. 26; Deut. xv. 19, 20). The practice was too terrible, however, to continue after some little progress had been made from an utterly barbarous to a more civilised life. It became customary to redeem the first-born of man by the substitution of some animal or the payment of a sum of money to the priest (Ex. xxxiv. 20; Num. iii. 11-13, 40-51; viii. 5-19; xviii. 15, 16). Many scholars consider that circumcision, which was practised by so many Eastern nations, was a substitutionary rite—the sacrifice of a significant part for the whole (cf. Ex. iv. 24-26), on the day (the eighth) on which the literal sacrifice used to be made (Lev. xii. 3, cf. Ex. xxii. 29, 30), as also the Jewish Passover (cf. Ex. xiii. 15). Be this as it may, human sacrifices were undoubtedly offered among the Israelites, as among other nations, on extraordinary occasions. Thus Jephthah sacrificed his daughter (Jud. xi. 29-40; although much ingenuity has been expended in trying to explain this away). Samuel hewed Agag in pieces 'before the Lord' (1 Sam. xv. 33). David gave seven of the sons of Saul to be hanged up 'before the Lord' by the Gibeonites in order to avert a famine which had visited the land (2 Sam. xxi. 1-9). Mesha, King of Moab, sacrificed his eldest son when he was hard pressed by the Kings of Judah and Israel (2 Kings iii. 26, 27).

2. Another occasion for offering S. was the making of Vows, that is, incurring obligations to the Deity on the fulfilment of certain conditions, such as granting deliverance from death or danger, success in an enterprise, &c. Thus Jacob vowed that if he returned safe from Padan-Aram he would dedicate to Jehovah the tenth of his goods, and make the place of his vision (Bethel) a place of worship (Gen. xxviii. 18-22; cf. Jer. xlv. 25; Jon. i. 16; Homer, *Il.* i. 64, &c.; Xenophon, *Anab.* iii. 2, 12; Virgil, *Georg.* i. 436, &c.; Horace, *Carm.* i. 5, &c.; Livy, xxii. 9, 10). Even human victims were sometimes offered in this way, as was done by Jephthah. Saul on one occasion devoted ('cursed') the man who should eat anything that day, and his own son Jonathan would have been sacrificed for the vow had not the people prevented it (1 Sam. xiv.).

3. Another occasion for S. was the making of Covenants. Among the Greeks, on such occasions, a lamb or other animal was slain and a libation of wine made, with an imprecation to this effect: 'As this animal is slain and this wine poured out, so may he who breaks this covenant be slain or have his brains poured out.' Among the Semitic tribes the form of S. was to cut one or more animals into halves, between which the parties to the covenant passed. An account is given in the book of Genesis of a covenant made between Abraham and Jehovah, which was ratified in this way, Jehovah being represented by a smoking furnace and a burning lamp (Gen. xv. 7-21; cf. Jer. xxxiv. 18-20). So Moses sprinkled the altar and the people with the blood of the covenant (that is, of the sacrifices offered in ratifying the covenant) which was made between them and Jehovah (Exod. xxiv. 3, 8).

4. Of less important matters there was an endless variety that called for a gift to the altar: such ordinary occurrences as the birth of a child, touching a dead body, &c.; ill-omened occurrences, such as a monstrous birth, a shower of stones, &c. In the Mosaic Law there were four kinds of S.: Burnt-offerings—of a lamb offered night and morning for all the people; Peace- or thank-offerings; Sin-offerings—for inadvertent transgressions of ordinances; and Trespass-offerings—for wilful transgressions.

The idea of S. has been introduced into the Christian Church by the fact that Jesus Christ is spoken of in the New Testament as a S. Besides incidental references in the other Epistles, the analogy between his S. and those of the Mosaic Law is the great argument of the Epistle to the Hebrews. Now the meaning attached to the S. of Christ by the New Testament writers turns on the meaning attached to sin-offerings in the Old Testament. The received doctrine on the subject is, (1) 'That the design of such offerings was to propitiate God; to satisfy his justice, and render it consistent therewith that the offences for which they were offered should be forgiven.' (2) 'That this propitiation of God was secured by the expiation of guilt.' (3) 'That this expiation was effected by the victim being substituted for the offender, and suffering the penalty which he had incurred.'

(4) 'That the effect of such sin-offerings was the pardon of the offender, and his restoration to the privileges he had forfeited.' It is therefore inferred that when the New Testament declares that Christ was a S., it is intended to teach that he was the substitute for sinners, that he suffered the penalty of the law in their stead, thereby rendering it consistent with the justice of God that they should be pardoned and restored to the divine favour. On the other hand, it is maintained that there is no standing-ground at all for imputing to the Hebrews, Greeks, or Romans the belief that the slaying of victims could atone for conscious, wilful sin. Even the Epistle to the Hebrews says distinctly that S. could not purify the conscience, but only the flesh, that 'the blood of bulls and of goats could not take away sin' (ix. 6-13, x. 4, 11). It has therefore been urged by Maurice and other theologians that the essence of Christ's S. consisted in doing his Father's will against the antagonistic influences of human frailty; that he 'devoted' himself to God and triumphed through perfect self-oblation; that the cross was only the consummation and crown of his life-sacrifice; and that men first become conscious of the 'exceeding sinfulness of sin,' when they see it made visible in his unmerited sufferings and pangs. In this way only, it is affirmed, was he 'made sin for us;' and it is only by a penitence springing from a living perception of this self-sacrificing love that we become 'the righteousness of God in him' (2 Cor. v. 21). Cf. ATONEMENT. See Spencer's *De Legibus Hebr.* (Hag. 1686); Potter's *Archæologia Græca* (4th ed. Lond. 1722); Kalisch's *Com. on Leviticus*; Kurtz's *Der Alt-test. Opfercultus* (Eng. trans. Edinb. 1863); Delitzsch's *Com. zum Briefe an die Hebræer* (Eng. trans. Edinb. 1868); Hodge's *Syst. Theol.* (Edinb. 1873); and Duncker's *Gesch. des Alterthums* (Eng. trans. Lond. 1878).

Sacrilege (Lat. 'the stealing of anything sacred') is not now a legal term, but as popularly understood, the crime is punishable under 24 and 25 Vict. c. 96, which enacts that theft from any place of worship, or breaking into any place of worship with intent to steal, is a felony, punishable by imprisonment or penal servitude.

Sacristan (Lat. *sacer*, 'sacred'), an ecclesiastical official who takes charge of the sacred books and utensils employed in the service of a church. The word sexton is a corruption of S.

Sacristy (Lat. *sacer*, 'sacred'), a chamber in which are preserved the articles in charge of the sacristan. In Roman Catholic and other churches in which great value is sometimes set upon such articles, the S. is regarded with much veneration, and is adorned in the most costly manner.

Sacrobosco, Johann'es, or John of Holywood, was born probably at Halifax, Yorkshire, entered the order of St. Augustine, studied subsequently at Paris, where he became professor of mathematics, and there died in 1256. His works are *De Sphæra Mundi*, based on Ptolemy's *Almagest*; *De Anni Ratione, seu de Computo Ecclesiastico*, and *De Algorithmis*, one of the first works in which the Arabic numerals were introduced.

Sacrum, the name given to the vertebra of the spine intervening between the lumbar vertebra, or those of the loins and those of the tail. The S. in man consists usually of five vertebrae united to form a wedge-shaped bone, inserted between the haunch bones behind, and thus entering into the formation of the Pelvis (q. v.). By its base the S. articulates with the last lumbar vertebra, whilst the four small vertebrae called the *coxae* are in turn articulated to the apex of the S. The S. is curved somewhat upon itself, its anterior surface is concave from above downwards, the posterior surface being convex. The *sacral canal*, continuous with the *spinal canal* which lodges in the *spinal cord*, runs through the S. The name 'S.' is derived from the fact that in ancient sacrifices this bone was esteemed specially sacred. The Jews called this bone 'luz,' and supposed it resisted decay. Eight and ten vertebrae are found in the S. of certain monkeys and armadillos; while in birds as many as twenty vertebrae may enter into the composition of this bone.

Sacy, Antoine Isaac Silvestre, Baron De, one of the most distinguished of Oriental scholars, was born at Paris, September 21, 1758. He early applied himself to the study of Oriental languages, becoming especially proficient in Arabic and Persian. In 1795 he was appointed Professor of Arabic at the newly founded *Ecole des Langues Orientales*; and in the same year, with Camus Langlès and other scholars, he undertook the

management of the *Journal des Savants*. A member of the French Academy as early as 1785, he became Professor of Persian at the Collège de France in 1806; in 1808 he was elected to the Corps Législatif, and in 1813 created Baron. In 1822 he became administrator of the Collège de France, and in the same year founded with Abel Rémusat the Société Asiatique. In 1832 he entered the Chamber of Peers, and was immediately appointed inspector of the Oriental type in the royal printing-office. Next year he became keeper of the Oriental manuscripts in the royal library, and perpetual secretary of the Académie des Inscriptions. He died at Paris, February 21, 1838. To this profound scholar modern Oriental learning owes perhaps more than to any other man. He exerted a vast influence not only over France but all Europe by his numerous works, his liberal teaching, and his incessant correspondence. Some of his most distinguished pupils were Chézy, Quatremère, Jaubert, Reinaud, Saint-Martin, Freitag, Kosegarten, and Rasmussen. The creation of the chairs of Sanscrit, Chinese, and Hindustani, in the Collège de France, was also due to his ardent advocacy of their claims. His principal works were *Annales des Sassanides*, translated from the Persian of Mirkhond (Par. 1793); *Chrestomathie Arabe* (3 vols. 1806, 1826-27); *Grammaire Arabe* (2 vols. 1810, 1831); *Relation de l'Égypte*, translated from the Arabic of Abd-Allatif (1810); *Mémoires d'Histoire et de Littérature Orientales* (1818); and *Exposé de la Religion des Druses* (2 vols. 1838). Besides these he made many contributions to the *Magasin Encyclopédique*, *Moniteur*, *Bibliothèque Française*, *Revue des Deux-Mondes*, *Journal des Savants*, *Annales des Voyages*, *Journal Asiatique*, *Biographie Universelle* &c. See Reinaud, *Notice Hist. et Littér. sur Silvestre de S.* (Par. 1838).—**Samuel Utazade Silvestre de S.**, son of the preceding, was born at Paris, October 17, 1801. After a course of study in law, and a short time of practice as an advocate, in 1818 he became attached to the *Journal des Débats*, and until 1852 wrote two-thirds of all the political articles which appeared in its columns. The establishment of the Empire, however, in that year, restricted him to pure literature, and he has since been the principal reviewer of the same journal. In 1854 he was elected a member of the French Academy, in 1836 keeper, and in 1848 administrator of the Mazarin Library, and in 1864 he became member of the Council of Public Education. He has published a selection from his articles under the title *Littéraires, Morales et Historiques* (2 vols. Par. 1858; 2d ed. 1861); and an edition of the *Lettres de Madame de Sévigné* (11 vols. Par. 1861-64).

Saddle (Old Eng. *sadel*, Ger. *sattel*, Lat. *sella*, dim. of *sedile*, 'a seat'), a seat or pad for the back of a horse, used in riding or in driving. It is secured by a girth-strap passed round the animal's belly. Driving or harness saddles have been employed from a very remote period, as Egyptian wall-paintings and Assyrian sculptures testify. It is uncertain at what time and in what country the riding-S. was invented. Beckmann (*History of Inventions*) is of opinion that it originated in Persia, and it is generally asserted that it was unknown before the 4th c. of our era. On the other hand, Ginzrot, a German author of a valuable work on carriages and harness, believes that the Greek *ephippion*, usually interpreted as a horse-cloth, signified a proper S. In 4th c. writings, the phrase *sella equestris*, the exact equivalent of a riding-S., occurs. In the year 385 Theodosius the Great restricted the weight of a S. and bridle (*sella cum frenis*) for post horses to 60 lbs. Horsemen in Scandinavia were acquainted with the S. prior to the 6th c., and in England, according to the venerable Bede, in the 7th c. It appears from Old Eng. MSS. (Cottonian Collection) that the side-S. for the use of ladies was known in England at a much earlier period than is commonly ascribed to it, viz. the 11th c., when, it is said, Anne of Bohemia, queen of Richard II., introduced it. On certain occasions, however, as in hunting, ladies rode astride like men long after the side-S. was introduced. In the 16th and 17th centuries unskilful horsewomen rode on a *fillion* or padded seat behind a cavalier or servant.

A S. has a foundation or framework of beechwood strengthened with strips of iron, called a 'saddletree.' It is covered on the underside with serge and on the upper with leather, a padding of flock, hair, or other soft material, being inserted between to secure softness and elasticity. The parts of a riding-S. are called the 'seat,' 'skurts,' and 'flaps,' very often having 'kneepads;' these parts are joined so as to form one piece, and under

it is nailed a firm cushion named 'the pannel.' The fore part of a 'saddletree' is termed the 'head' or 'pommel,' the back part the 'cantle'; to the latter the 'crupper-loops' are attached, and on the sides are the 'spring-bars' from which the 'stirrup-leathers' depend. The different kinds of saddles vary much in weight; a racing-S. weighs 2 lbs. only, an ordinary S. from 9 to 13 lbs., and a military S., in which the 'pommel' and 'cantle' rise higher than usual, 25 or 30 lbs.

Saddlery is an important industry, and is concerned with the manufacture of saddles and harness of all kinds, holsters, valises, cartridge cases and pouches, gun-cases, belts, portmanteaus, travelling and letter bags, leggings, satchels, dog-collars, and many other articles made of leather. Whipmaking, though sometimes combined with saddlery, is generally carried on separately. 'Brown' saddlery comprises all articles in uncoloured leather, and 'black' saddlery carriage harness and other articles in black or japanned leather. The metal mountings of saddlery are obtained by the saddler from his ironmonger. Walsall, Birmingham, Ashton, and London are noted seats of the saddlery industry, the first three having, in 1871, 2644 out of the total of 23,011 saddlers in England and Wales. English saddlery enjoys high repute for serviceableness and durability, and the value of the saddlery and harness exported to British dependencies, notably Australia, and other countries, in 1876 amounted to £397,561. In the United States, this industry in 1870 employed 23,557 persons, and produced goods valued at \$32,709,981.

Sadd'leback, a mountain in Cumberland, $4\frac{1}{2}$ miles N.E. of Keswick, with a height of 2787 feet.

Sadd'ucees [Gr. *Zaddoukaioi*, Heb. *Tsaddukim*, most probably derived from Zadok, either as the name of the well-known priest in the time of David (2 Sam. viii. 17, &c.), or more probably of a disciple of Antigonos of Socho (B.C. 200-170)] were the priestly aristocracy among the Jews after the Captivity; being distinguished from the Pharisees (q. v.) in the first place by their *higher rank* as a social order. The names by which they were afterwards known were first applied to the two classes as parties under Jonathan Maccabaeus (B.C. 161-143). 2. In Political matters the S. went on the principle that human ingenuity and statecraft are to be employed in a nation's dealings with other powers, and hence they promoted foreign alliances, and the introduction of Hellenism. 3. But as in Politics the S. were the liberal party and the Pharisees the conservative, in religious, legal, and ritualistic matters the chief peculiarity which distinguished the S. from the Pharisees was their conservatism. (1) They held that the canonical Scriptures, with the authoritative explanations, were the only rule of faith and practice, denying the Traditions of the Pharisees. (2) They denied the resurrection of the dead, although without denying the immortality of the soul. (3) They interpreted literally many laws which the Pharisees had modified. (4) Standing on their priestly dignity and ancient prerogatives, they maintained with great rigour the old enactments regarding the sacrifices, the treasury, &c.

Well-nigh extinguished at the destruction of Jerusalem, the S. benefited specially by the revival of Judaism at the foundation of Islamism, and renewed their youth as the Karaites (q. v.), a name ('Scripturalists') which they are said to have borne at first. See Ginsburg in Kitto's *Cyclop. of Bib. Lit.* (3d ed. Edin. 1876).

Sad'leir, Sir Ralph, was born at Hackney, Middlesex, in 1507. In his eleventh year he attracted the notice of Henry VIII., by whom he was afterwards employed in the dissolution of the religious houses, and rewarded from their spoils. From 1537 to 1542 he made several journeys to Scotland upon diplomatic business, first to strengthen the English interest at the northern court, twice thereafter to persuade James V. to cast off the supremacy of the Pope, and again to bring about the proposed match between Edward, Prince of Wales, and the infant Mary, afterwards Mary Queen of Scots. Upon the accession of Mary Tudor to the English throne, he retired to his estate near Hackney. Elizabeth called him to the Privy Council, and appointed him keeper of Queen Mary in the Castle of Tutbury. After the execution of the unfortunate queen, he was sent to pacify King James. He died at Standon, Hertfordshire, 30th March, 1587. His *State Papers and Letters* (Edin. 1809) were prefaced by his memoir by Sir Walter Scott. See *A Memoir of the Life and Times of the Right Hon. Sir R. S.*, compiled from *State Papers* by his Descendant, Major F. Sadleir Stoney (Lond. 1877).

Sadole'to, Jacopo, a celebrated Italian humanist, was born at Modena, July 14, 1477. He was ordained a priest in 1502, and appointed apostolic secretary by Leo X. in 1513, and by Clement VII. in 1523. Nominated Bishop of Carpentras in 1517, and Cardinal by Paul III. in 1536, he died at Rome, October 18, 1547. S. was much esteemed in his own age for his sincere piety and his love of learning, while his moderation and desire for the reform of the Church from within, led to his employment in various negotiations between Karl V., François I., and the Popes. Of his works, which are distinguished for the clearness and Ciceronian dignity of their style, the chief are—*De Liberis recte Instituendis* (Paris and Venice, 1533, often reprinted; French trans. by Charpenne, Paris, 1855); *In Pauli Epistolam ad Romanos* (Venice, 1536); *Hortensius, sive de Laudibus Philosophiæ* (Lyon, 1538); *Epistola ad Senatam Populumque Genevensem* (Strasb. 1539; French trans., with a reply from Calvin, Geneva, 1540); *Poemata* (Leipz. 1548); *Philosophiæ Consolationes et Meditationes in Adversis* (Frankf. 1577). By his *Epistolarum Libri xvii.* (Lyon, 1550; 5 vols. Rome, 1759-67) alone he is now remembered. See Joly, *Étude sur S.* (Caen, 1857).

Sad'owa, a village near Königgrätz (q. v.) in Bohemia, after which the French name the great battle fought there, 3d July, 1866.

Safe, a structure meant to secure money, jewellery, valuable books and documents, and other precious articles, first against fire, and second against thieves. Safes are of two forms, vaults or strong rooms, and portable safes. The security of a strong room depends on the thickness of the masonry of which it is entirely built, and on the nature of the non-conducting medium with which the walls are surrounded. Only as regards their doors are fire-proof vaults subject to the same rules as the ordinary movable safes. In making a common S., the two points, security against fire and thief-proofing, have to be kept in view; and fortunately these two objects are rather mutually helpful than antagonistic. The fire-proofing of safes is effected by building up an outer case of strong plates of malleable iron, between which and an inner casing of the same metal is a space which is filled with some heat-resisting and non-conducting medium. The substance originally used was charcoal in its natural state or steeped in an alkaline solution (Scott's patent, 1801); afterwards, in 1840, Thomas Milner patented the use of sawdust packed with tubes or closed vessels containing alkaline solutions which only burst under the influence of heat. Other valuable fire-resisting compositions consist of ordinary plaster of Paris prepared with water, and poured into the cavity, where it 'sets'; secondly, powdered plaster and alum in equal proportions; or thirdly, 50 per cent. alum, 25 of clay, and 25 of pounded marble. For thief-proofing of safes, the joints have to be made of great strength, the door strongly hinged, and made to lock so that the S. is fastened, not by one, but by a series of bolts all round the edges of the door. These bolts are shot by the handle, and only secured in position by the bolt of a small lock shot by the key. The keyhole and seams have to be secured against the admission of gunpowder; and to prevent drilling, the plates on which the lock is riveted are thickly studded with hard steel spikes. In the S. by Bash & Co., Glasgow, the bolts not only pass into the side of the safe, but through heavy studs strongly secured to the door itself.

Safe-Conduct. See PASSPORT.

Saf'ed, a town of Palestine in the ancient Roman province of Galilee, situated on a mountain nearly 2700 feet high, 12 miles N. of Tiberias. On the N. side stands the old citadel of the crusaders, and on the S. a quadrilateral building resembling a fort, between which is the Mussulman quarter. W. of it, and on the slopes of the mountain, is the Jewish quarter. S. is much frequented by the Jews, who believe it will be the capital of the expected Messiah. It has 30 synagogues and a famous college, which is one of the principal seats of Hebrew learning. There are manufactures of cloth and dyeing, besides considerable trade in wine and oil. Pop. 4000. S. was almost destroyed by an earthquake in 1837, when 2000 Jews and 300 Mohammedans were destroyed.

Safety-Cage. See MINING.

Safety-Fuze is the name applied to a waterproof woven tube containing an inflammable composition which has a regular

rate of combustion. It is employed to ignite gunpowder cartridges in blasting, in lengths sufficient to allow of the workmen reaching a place of safety before the blast.

Safety-Lamp. The frequency and often terrible fatality of accidents in coal-mines caused by the explosion of accumulations of fire-damp, led Sir Humphrey Davy and other inventors in the early part of the present century to devise a means of carrying light into fiery mines without thereby causing explosion. In the course of his investigations Sir H. Davy discovered that the flame of a lamp, if separated from explosive gases by wire gauze of definite size and mesh, is incapable of igniting such external gases. On this principle his S. L., the celebrated *Davy*, was constructed. It consists simply of an ordinary oil lamp surrounded and enclosed with a cylinder of fine wire gauze. The cylinder as now made is about 8 inches high by 2 inches in diameter, composed of gauze with from 28 to 30 wires per inch in both warp and weft, the wire cloth being not less than $\frac{1}{16}$ th of an inch in thickness. The 'Davy' is still regarded by practical men as one of the safest and most efficient of all lamps, but miners object to it on account of its feeble light. The eminent engineer George Stephenson, working independently at the same time as Sir H. Davy, discovered the same property of wire gauze, and constructed a lamp known by miners as the

'Davy' Lamp.

'Geordie,' similar in principle to the 'Davy,' but having inside the wire-gauze a cylinder or shield of glass. The wire-gauze cylinder of the Geordie is about 6 inches high by 2½ in diameter, and air for combustion is admitted by perforation in the bottom, the products of combustion being passed out through a metal disc perforated with small holes. The *Clanny* S. L., invented by Dr. Clanny of Sunderland, has a glass tube placed outside and around the wire cylinder. The *Upton and Roberts* lamp has also an internal cylinder of gauze covered externally at the lower part by a band of strong glass, the upper part, where light does not require to be transmitted, being surrounded by a brass cylinder. In the *Musseler* or *Belgian* lamp the light is surrounded by a thick glass cylinder. The products of combustion are carried by a metal furnace upwards through a cylindrical cap of wire-gauze. This form is extensively used in Belgium, but in England it is not thought so safe as a light protected throughout by both gauze and glass. A great number of different forms of lamp have been proposed and used from time to time, but without exception they are based on the principle of separating the light by wire gauze from the explosive compounds in which it may be placed. The security of safety lamps, so that they cannot be opened by miners while in the pit, is a point of great importance and has given rise to numerous devices. Some are so made as to be self-extinguishing when any attempt is made to withdraw the light. Locking the cover to the cistern and lamp is commonly resorted to, and combination-letter locks have been proposed. In another form the lamp is locked by a magnetic bar turned into staples internally by a powerful magnet, and only opened on being reversed by the magnet. It is obvious that all devices however ingenious are of no avail so long as men can carry and light matches in fiery pits, and it may be said that the best and only efficient lock for a S. L. will consist in educating miners to understand the fearful risks to which they expose themselves and their fellows by the reckless use of open lights, and by the habit of smoking when they are underground.

Safety-Valve, in the steam engine, is a circular valve which is forced open when the pressure of the steam in the boiler becomes too great. For lower pressure, the valve is kept in position by its own weight or by a lever pressing down upon it. When the S. V. is in perfect order there can be very little chance of the boiler bursting, since the strain can never exceed a particular amount. Cases, however, are not uncommon when accidents have occurred through the jamming or over-weighting of the S. V. See STEAM ENGINE.

Saff'i, Azaff'i, or As'fi, a port of Morocco, 107 miles W.N.W. of the capital. It is built in a sterile mountain basin, and its only harbour is an exposed roadstead. From 1508 to 1641 it was held by the Portuguese, and prior to the rise of Mogador its trade was extensive. In 1877 its imports amounted in value to £44,260, and its exports (of which beans, maize, wool, and gum were the chief items) to £148,384. Pop. about 12,000, of whom a fourth are Jews.

Saff'lower, or Bastard Saff'ron (*Carthamus tinctorius*), a rather handsome annual herb from 2 to 3 feet high, belonging to *Compositæ*, is cultivated for its flowers and seeds in India, China, and other parts of Asia, also in Egypt and Southern Europe. The florets after being plucked are usually pressed into small round cakes and carefully dried. The principal use of S. is for dyeing silk, a series of red and yellow shades being produced according to the various admixtures employed. Carthamin (q. v.) and Carthamus-yellow are the pigment principles, and the first, when precipitated from its alkaline solution and mixed with very finely powdered talc, constitutes *rouge*. S. is also used to adulterate the more expensive saffron. The seeds yield by expression an oil which when properly prepared and refined is transparent and of a light yellow colour. In India it serves for culinary purposes, &c., and it is believed to constitute the bulk of 'Macassar oil.'

Saffron (Fr. *safra*, Sp. *Azafran*, Ar. *Al zahafaran*) is the carefully-dried, deep orange-coloured stigmata of *Crocus sativus*, an autumnal flowering species of this familiar genus, native of Asia Minor, and now more or less naturalised in many parts of Europe. The plant is extensively cultivated in Spain, France, Austria, Italy, the mainland and isles of Greece, &c., for the production of S., which is used as a flavouring and colouring ingredient in culinary preparations, liqueurs, confectionary, and other articles of food; also as a perfume, and the extract in painting and dyeing. The yellow colouring principle named polychroite is remarkable for being totally destroyed by the action of the solar rays, and of forming blue tints when treated with sulphuric and nitric acid. Up to about a century ago this crocus was cultivated in England, a reminiscence of the fact existing in the name S.-Walden (q. v.). *Medicinally*, it is sometimes administered as a stimulant, but is of little power, and is chiefly used merely for improving the colour of mixtures. On account of its high price considerable adulteration takes place in this drug.

C. serotinus of S. Europe also produces S. rich in pigment. Cape S. is the flowers of *Lyceria crocea* (*Scrophulariaceæ*), which when dried have a S.-like odour and give a fine orange dye.

Saffron-Walden ('the wood or waste land where saffron was grown'), a town of England, county of Essex, on the river Cam, 45 miles N.E. of London by rail. It stands on a hill on the borders of Cambridgeshire, and is a place of great antiquity. The chief public buildings are the townhall, corn-exchange, post-office, Gibson's Hospital (1866), a museum of natural antiquities, and a literary institute. The parish church of St. Mary has a fine peal of bells, and was restored (1860-67). R. has a free grammar-school, and carries on a trade in malt, barley, and cattle. Pop. (1871) 5718.

Sa'ga (Icel. 'a tale,' from *segja*, 'to relate;' comp. Old Eng. *saga* and *sagu* (later 'saw'), from *secan*, 'to tell'), a prose tale, so named from the rich collection of such in the old literature of Iceland. They long passed from mouth to mouth before being written down. This probably began to be done in the 12th c. The Sagas are very various; many relate to Iceland (as the S. of Njal, translated into English by G. W. Dasent, Lond. 1861), the Orkneys, the Færoes, and Greenland; others describe events in Scandinavia and adjacent countries (as Snorri Sturluson's *Heimskringla*, the *Yngvikinga-S.*, the *Knytinga-S.*); others again are mythical and romantic (as the *Volsung-S.*, *Herzager-S.*, *Halfs-S.*, *Frithiofs-S.*, *Orvarods-S.*, *Kolf S.-Krakes*, *Regnar Lodbroks-S.*); while some are romances and legends translated from foreign tongues. The sagas are often marked by great literary art, not least in depicting character, and by choice and powerful language. Their authors are mostly unknown. P. C. Müller's *Sagabibliothek* (Copenh. 1817-20) affords a useful survey of the S. literature, which is equally important for history, poetry, and language.

Sag'an, a town of Prussia, province of Schlesien, on the Bober an affluent of the Oder, 37 miles W. of Glogau by rail. It has a castle and four churches, and is the seat of a large manufacture

of cottons, paper, and woollens, the latter alone giving employment to 1600 hands. Pop. (1875) 10,541.

Sage. See LE SAGE.

Sage (*Salvia*, from Lat. *salvus*, in allusion to its supposed healing properties) is a large genus of *Labiata*, represented in all temperate and tropical regions. The 450 species of which it consists are all herbs or shrubs with whorled bracteate flowers; a tubular or campanulate calyx; the upper lip of corolla erect, the lower three-lobed; the stamens two, with diverging branches. Common or garden *S.* (*S. officinalis*), a native of countries bordering the Mediterranean—preferring a calcareous soil—is a familiar evergreen 'sweet herb' of the kitchen garden, the leaves and tender tops being used in stuffings and sauces, as well as to improve the flavour of various articles of cookery. The Clary (q. v.) (*S. Sclaria*) is sometimes used as a substitute for *S.* From the *S.* an essential oil is obtained by distillation, and a popular domestic astringent and tonic infusion called *S. tea* is made from the dried leaves and shoots.

Among ornamental species of *S.* may be mentioned *S. candelabrum*, a native of Spain, with contrasted yellowish-green and rich violet flowers, *S. lyrata*, *S. urticifolia*, *S. verticillata*, &c., for the garden; while for furnishing large conservatories brilliant flowers are produced in the greatest profusion by *S. splendens*, *S. Heeri*, *S. gioneræfolia*, through the winter and spring.

Saghalien. See SAKHALIN.

Saginaw, a town of Michigan, U.S., 18 miles above the mouth of the *S.* River, 100 miles N.W. of Detroit by rail. It has eight churches, four libraries, two banks, and two newspapers, besides numerous saw-mills, saltworks, shingle-mills, &c. In 1875, *S.* produced 60,844,939 feet of lumber, 143,861 barrels of salt, and 54,421,560 shingles, besides \$500,000 worth of other articles. Pop. (1870) 7460.—**S. Bay**, in the W. of Lake Huron, is 30 miles broad, and extends S.W. for 60 miles. It has valuable fisheries.

Sa'go (Malay, *sagu*, 'bread') is a variety of starch obtained from the cellular tissue of the *S.* palms, *Sagus Rumphii* and *S. Lavis*, natives of the E. Indian Archipelago. The trees for *S.*-making are felled at the period their flowering spike forms, which is when they are about fifteen years old. The stems are cut into sections about 2 feet in length, which are split up and the pithy substance scooped out and beaten in water to separate the starch granules from the associated ligneous tissue. After repeated washing and straining, the starch is obtained in a purified form, and may in that state be used for food or the other purposes to which ordinary starches are applied. To prepare the round pellets, in which shape it is found in Western commerce, the moist starch is spread out in a thin layer and allowed to dry in the sun. It is then broken and pounded to small fragments, which are assorted into sizes, placed in bags, hung up, and shaken, and the attrition of the pellets rounds off their edges, and thus produces 'pearl,' 'medium,' and 'bullet' *S.* A factitious *S.* is made in France from potato starch; but the difference of the two starches is easily detected by the microscope. A coarse variety of *S.* is made in India and Ceylon from the nuts of *Cycas revoluta* and *C. cincta*, and various palms in addition to those above mentioned also yield a similar starch. The amount of *S.* imported into Great Britain for 1876 amounted to 338,230 cwt., valued at £237,903.

Sagou'in (*Callithrix*), a genus of *Platyrrhine* or New World monkeys, popularly named 'Squirrel Monkeys.' They belong to the family *Cebida*, and are small, active, and readily tamed. The fur is long and thick. A typical example is the *C. sciureus* of Brazil.

Sagua-la-Gran'de, a town of Cuba, on the River *S.*, 12 miles from its port, Concha, at the mouth of the river, and 35 miles N. of Villa Clara by rail. In 1867 it exported 1,024,358 cwt. of sugar, and 390,200 cwt. of molasses. Pop. 9632.

Saguenay, a river of Canada, tributary of the St. Lawrence, which it joins 120 miles below Quebec. The Chomouchuan, or main branch of the *S.*, rises in the Laurentian mountains, and flows first E. then S.E. for 215 miles, when it enters Lake St. John. Here it receives the Mistassini, 180 miles long, the Paribonza, 165 miles long, and the Metebetchuan, 110 miles long. On issuing from the lake it forms numerous rapids, and gradually widens till it attains a breadth of 2 miles, after which it

again narrows and proceeds to the St. Lawrence through a deep gorge whose cliffs are often more than 1500 feet high. The *S.* drains an area of 23,700 sq. miles, which, being mostly mountainous and densely wooded, discharges a very large volume of water. Its great depth, sometimes above 100 fathoms, renders it navigable for 110 miles, and much timber is shipped from its banks.

Sagun'tum, anciently a town of Hispania Tarraconensis, on the Mediterranean, was founded by Greek colonists from Zacynthus, but contained also an Italian element. It was a commercial town of great importance, and its possession became matter of contest in the Punic Wars. Siding with Rome it was besieged by Hannibal in 218 B.C., and held out for eight months. This siege led directly to the Second Punic War. Afterwards *S.* was made a Roman colony, and became famous for its earthenware and for the fruits grown in the fertile soil around. Murviedro (*Muri Veteres*) occupies the site of *S.*

Sah'ara, a vast region of Northern Africa, extending, in its widest signification, from the southern slope of the Atlas range to the basins of the Senegal and Niger, and from the Atlantic to Egypt and Nubia, its area being variously estimated at from 2,000,000 to 2,436,000 sq. miles. In its more restricted sense the term *S.* is applied to the region lying between the Atlas and the rainless desert tracts of the south, whose northern boundary is not clearly defined. The surface of the *S.* declines from elevated steppes in the N. to sandy downs, and then spreads out into wide rolling plains covered with stones or sand, which are usually plateaux, but in some parts are said to be depressed below the sea-level. There are two principal areas of depression, viz., one in the N.W. known as El Juff, and one in the N. between the Great Syrtis and Gulf of Sidra. In 1877-78 an expedition was engaged in ascertaining the feasibility of a project for flooding El Juff—which is said to present evidence of having once been the bed of a sea—with the waters of the Atlantic, to be introduced by a short canal cut at the mouth of the Belta Valley. In the central *S.* there are occasional mountain regions, of which that of Air or Asben attains a height of 5000 feet, and a peak in the region of Tibesti, farther to the N.E., a height of 7880 feet. The most purely desert portion of the *S.* is the Erg, or Areg, a belt of sand dunes stretching from the interior of Tunis to the basin of the Senegal, a distance of 2000 miles, and having a general breadth of 200 miles. The desert portions of the *S.* are almost rainless, and are swept by burning E. winds for three-fourths of the year. The nights, however, are very cold, owing to the radiation. Much of the *S.* is capable of cultivation if artificially irrigated, and in Algeria it is being steadily encroached upon. (For a list of its principal oases see the article OASES.) In some cases the streams are subterranean, the most remarkable instance being that of the Wed Mzi, in central Algeria, which runs underground for most of its course of 400 miles, till it is finally dissipated in the large lagoon called the Shott Melrir. Only a conjectural estimate can be formed of the pop. of the *S.*, whose inhabitants may be classified in three divisions, viz.:—(1) in the W. the Moors and Arabs, nomadic races; (2) in the centre the Tuareg, or Tuaricks, a warlike Berber race, predatory in their habits and Mohammedans in religion; (3) in the E. the Tibbus, a negro race, with fixed dwellings, flocks, and cultivated fields, and in part Pagans. Slaves, gold-dust, ostrich feathers, ivory, salt, gums, and dates are the chief articles of Saharan commerce. They are carried across the desert in caravans, which return with manufactured goods. The great mart of the *S.* is Timbuktu (q. v.) on its southern edge. See *The Great S.*, by H. B. Tristram (Lond. 1860); *L'Avenir de la France en Afrique*, by Paul Soleillet (Par. 1876); *The Flooding of the S.*, by Donald Mackenzie (Lond. 1878); Dr. Chavanne's *Die S., oder von Oase zu Oase* (1st Pt. Vien. March, 1878); and the works of Barth, Rohlf, and Nachtigal.

Saharanpore, the chief town of the district of the same name in the N.W. Provinces, British India, a station on the railway, and close to the E. Jumna Canal, 90 miles N.N.E. of Delhi. It contains an old fort, a newly-built mosque, and many public buildings, and is the headquarters of the canal establishment. *S.* is famous for wood-carving and silversmiths' work. There is also a stud farm, and botanical gardens established in 1817. The trade is considerable in grain, spices, and piece-goods. Pop. (1872) 43,844.—The district of *S.*, which lies in the upper doab,

between the Ganges and Jumna rivers, and is bounded N. by the Shiwalak hills, has an area of 2217 sq. miles; pop. (1872) 884,017. It is also watered by the river Hindun, and by the Ganges and E. Jumna Canal. The crops are wheat, barley, rice, pulses, millets, and cotton. The breed of horses is good. The total railway traffic in 1872 was 21,000 tons. The towns are Rurki, with its engineering college; Hurdwar, with the greatest annual fair in India; and Rampur, where there is a manufactory of glass bracelets. In the Mutiny of 1857, the women and children were sent up to the hills; and after the first outbreak order was maintained by means of a Gurkha regiment.

Sáheb, or **Sáhib** (originally an Arabic word, meaning 'master,' 'lord,' 'companion'), universally used throughout India by the natives in addressing European gentlemen. In vernacular patois, it is often prefixed or affixed to the official title, as *sahib-shistant*, 'assistant-judge.' Europeans generally are known as the *sahib-logue*.

Sáhebgunge ('the market-place of the English lord'), a common name for modern towns in India, which have grown up under English rule. (1) The suburb of Gaya (q. v.), where the civil quarters are situated. (2) A town in the district of the Sonthal Pergunnahs, Bengal, 154 miles by rail N. of Calcutta, on the right or S. bank of the Ganges. It has lately supplanted Rajmehal as the great trading centre where the river traffic changes to the rail, and *vice versa*; and it is also the station for registering all the Ganges-borne traffic. In 1876-77 the exports by rail were valued at £182,000, and the imports by river at £143,000. The chief articles of trade were indigo, £86,000; rice, stone, and hides, each £27,000; piece-goods and oil-seeds, £38,000; wheat, £17,000; and salt, £12,000.

Sai'ga. See ANTELOPE.

Saigon, the capital of the French possessions in Cochinchina, 37 miles from the Chinese Sea, on the navigable Donnai, which is connected with a network of river. The town is surrounded by fortifications, and in 1872 was garrisoned by 4153 men, while several ships of war are permanently stationed in the harbour. S. has two hospitals, large dockyards, and excellent stone quays. A cathedral is to be built (1878) at a cost of £32,000. In 1876 there loaded at S. 317 vessels of 234,299 tons (215 British, of 158,151 tons). The export of rice amounted in 1876 to 340,000 tons (value £1,567,904), and was chiefly to China (about 250,000 tons), America, and Europe. Other exports are cotton, sugar, opium, pepper, and coffee. Pop. 120,000 (10,000 Chinese). S. was acquired by the French in 1860, and its possession was ratified in the treaty of 1864 by the government of Anam. The Chinese, who have long solely carried on the import trade, have been gradually taking possession of the export trade, till in 1876 they shipped nine-tenths of the rice crop and the whole of all other articles of produce. The success of the Chinese is due to their greater economy, and their ability to purchase directly from the natives. See COCHIN-CHINA, LOWER or FRENCH.

Sail (Old Eng. *seġel*), a sheet of canvas spread out on a mast, spar, or stay of a vessel to catch the wind by which the vessel is propelled. A S. usually bears the name of the mast, yard, boom, or stay to which it is attached, as fore-sail, foretop-sail, maintopgallant-sail, &c. In a square-rigged vessel the sails extended on the yards athwartships are termed *square sails*, and those supported by gaffs, booms, or stays lying lengthwise of the vessel, *fore-and-aft sails*. Most of the latter are triangular or 'shoulder-of-mutton' shape; the others are four-sided. Trysails are fastened to small spars or gaffs abaft the lower-masts; that of the mizzen is distinguished as the *spanker*. *Staysails* traverse the stays of a mast. The square sails on the lower masts are known by the general name of *courses*. *Studding-sails* are suspended from booms rigged out beyond the extremities of the yards, and form wings to the square sails. Some of the parts of a square S. are the *head*, the *foot*, the *leeches*, the *earings* or upper corners, the *clews* or lower corners, and the *reef-bands*, stretches of canvas sewed across where eyelet holes are formed for the *reef-points*, or lengths of braided cordage, called *semit*, used to tie up the sails. A *bolt-rope* is sewed round the edges of a S. for strength, and *cringles* or loops are placed on the leeches for the attachment of *reef-tackle* to raise the S. in reefing. The leech on the weather side is the *luff*, and that on the lee-side, the *after-leech*. The *tack* is the lower

weather corner of a square S., and also the forward corner of a fore-and-aft S.; the after-corner of the latter is termed the clew. Square sails are presented at pleasure to the wind by turning the yards by means of braces hanging from the ends. Sails are said to be *set* when expanded, *furled* when folded up to the yard, and *reefed* when the area is reduced by drawing up a portion. Only large sailing-vessels carry a full equipment of canvas. The accompanying illustration shows the position of the various sails of a ship, *i.e.*, a three-masted vessel, square-rigged on each mast.

Merchantman under full sail.

A desire to lessen the risk to life in working the sails aloft, and to reduce the number of hands on the vessel, has led to several inventions for performing the several operations from the deck. None of the inventions has been widely adopted. That of Mr. Henry D. P. Cunningham, R.N., secured by several patents since 1850, is probably most favoured, and consists in giving a rotatory motion to the yards by means of ropes from the deck, while taking in or setting S. This plan necessitates the splitting up of the S. vertically, and the use of a separate slip of canvas to cover the slit when the S. is expanded.

Sailcloth, or **Can'vas**, a fabric of hemp, flax, cotton, or jute, woven in pieces, called *bolts*, measuring from 36 to 40 yards in length, and 24 to 30 inches in width.

Sail'ings, in navigation, include various approximate methods by which a navigator, from a knowledge of a vessel's course and rate of sailing, deduces the position of the vessel. The course is obtained from the indications of the compass, and the speed by means of the log-line. For a short course, such as a day's sailing, the earth's surface may be assumed to be plane, and the course may then be taken as the hypotenuse of a right-angled triangle, one of whose sides is the true difference of latitude made, while the other, known as the *departure*, is the actual distance made E. or W. When the latitude is known, the departure may be readily converted into difference of longitude. This method is known as plane sailing, and is the roughest approximation in use. When longer courses are considered, the sphericity of the earth can no longer be neglected. The problem now becomes one of spherical trigonometry. The shortest line connecting two points upon the surface of a sphere is the intercepted arc of the great circle through these points. A vessel, however, steered by a compass, does not traverse a great circle except in two very special cases; namely, when it is directed along a meridian, or along the equator. If a ship sails due E. or W. from a point, there is no change of latitude, and the distance traversed is simply the departure, from which, if the latitude is known, the difference of longitude can be deduced.

This is a case of *parallel sailing*. *Great-circle sailing* is noticed under a special heading. If a vessel is steered towards the same azimuth, its course cuts all meridians at a constant angle, and is therefore a rhumb line. On Mercator's projection, rhumb lines are represented by straight lines, and for this and other reasons what is called Mercator's sailing is the most accurate of all. This method, however, is not extensively employed, though the tabulated corrections are not difficult of application. When a ship's course is along a rhumb line, other than a parallel of latitude, the departure is ordinarily calculated according to the method known as Middle Latitude Sailing. It is evident that, supposing a vessel to sail for many days in the northern hemisphere from N.E. to S.W., her departure for the earlier latitudes would give too great a difference of longitude, and for the later latitudes too small. The average of the two, however, will give an approximation to the difference of longitude, and in the best nautical tables corrections are supplied for making this method more accurate.

Sainfoin, or **Saintfoin** (Fr. *sain*, 'wholesome,' *foin*, 'hay'; Lat. *santum fenum*), is *Onobrychis sativa*, a leguminous fodder-plant much cultivated as a shifting crop on dry calcareous or oolitic soils because of its deep-penetrating roots, which act beneficially to the land by fertilising it from their own decay, and by working up organic matter from below, thus forming a thicker surface crust, and so preparing the land for cereal culture. S. is fond of a marly soil, but stagnant underground humidity is fatal to it. The hay it yields is extremely nourishing for every kind of cattle, at the same time it is most advantageous to cut and use the plant in a green state. In favourable situations it may be made into hay twice a year, or mowed oftener for green fodder.

The genus *Onobrychis* consists of about fifty species of herbs or plants with imparipinnate leaves; leaflets quite entire; stipules scarious; flowers purple, red, or white, in axillary spikes or racemes; calyx lobes subulate; pod compressed, indehiscent, one- to two-seeded, often spiny, winged, or crested. Its area of distribution is Europe, temperate Asia, and Africa. The S. is native of W. and S. Europe and W. Asia, with the appearance of being indigenous also in dry fields and pastures of S.E. England; but from its long-standing cultivation in the country (since 1651) it exists in many cases merely a relic of that cultivation.

Saint (Lat. *santus*, Gr. *hagios*, Heb. *kadosh*, 'holy,' or *chasid*, 'pious'), in the Bible, means a holy person; either (1) as being specially dedicated to the service of God, in which sense the Israelites were a 'holy nation' (Exod. xix. 5, 6, &c.), as the Christian Church was composed of 'saints' (Rom. i. 7, &c.); or (2) absolutely holy in life (Ps. xvi. 10, lxxxix. 5, 7, 19), and among the blessed after death (Deut. xxxiii. 2; Matt. xxvii. 52, &c.), as Jehovah was the Holy One of Israel (Isa. x. 17, &c.). In the Christian Church those who endured persecution for their faith were from the first held in high honour. Martyrdom was regarded as a baptism in the person's own blood, which procured the grace of God and the pardon of all sins, and served as a direct passport to heaven (Matt. v. 10-12, x. 39; Rev. vi. 9). According to Tertullian, it was the second baptism with which our Lord himself was baptised (Mark x. 39; Luke xii. 50). Again, the day of a martyr's death was regarded as his birthday; and these birthdays were celebrated as festivals by families and churches, generally at the martyrs' tombs, with divine service, the celebration of the Eucharist, for which an altar was erected over the tomb, and a recital of the martyr's acts and passion. The names of the dead who were commemorated in this way, as well as of the living who brought oblations, were enrolled in the canon of the Mass (q. v.), or in double catalogues (*Diptycha*). This was the first form of Canonisation (q. v.).

As the intercession of a martyr was allowed to have great weight in getting the Lapsed (q. v.) re-admitted to communion with the Church, which was associated with the forgiveness of sins, the idea grew up that the intercession of martyrs in the other world was efficacious in obtaining the forgiveness of sins, as their sufferings not only blotted out their own sins, but were also sufficient to atone for the sins of others. It was only natural that the heathen converts should transfer to the martyrs the honours they had formerly paid to their heroes; and a kind of omnipresence was attributed to them such as was attributed to the heathen Demons (q. v.). Thus to the former notion of their efficacious intercession was added the belief that it was pos-

sible to communicate desires to them directly. Out of this veneration arose an elaborate system of S.-worship. In proportion as men thought they needed such heavenly intercessors the number of saints was increased. Martyrs before unknown announced themselves, or the places where their bodies were buried, in visions; and new saints were made, metropolitans having the right of creating saints for their provinces. In the Eastern Church a Feast of all the Martyrs had been observed since the 4th c. In the year 610 Pope Boniface V. obtained possession of the Pantheon at Rome, and this temple, which had been sacred to all the gods and especially to Cybele (q. v.), was now consecrated to Mary the Mother of God and all the Martyrs. The festival, which at first was held in the month of May, was transferred (834) by Pope Gregory IV. to the 1st November, and called All Saints. See INVOCATION OF SAINTS; BEATIFICATION; CANONISATION; also Hospinianus, *De Festis Christi* (Tigur. 1393); the Bollandists' *Acta Sanctorum* (begun 1643, and not yet completed); Bingham, *Orig. Eccl.* (2d ed. Lond. 1726).

St.* Albans. See ALBANS, ST.

St. Alban's Hall, Oxford, was founded in 1547, and took its name from Robert de St. Albans. It early came into the possession of Merton College, and was sometime after established as an academical hall. It has (1878) 66 undergraduates, 32 members of Convocation, and 125 members on the books.

Saint Amand, a town of France, department of Nord, 6 miles from Valenciennes, is famed for its hot sulphur springs, and has some small manufactures of porcelain, linen, &c. Pop. (1876) 10,716.—**Saint-A.-Mont-Rond**, a town of France, department of Cher, 27 miles S. of Bourges, has manufactures of porcelain, iron-foundries, and some trade in agricultural products. The castle of Mont Rond dominates the town, and the Canal du Cher passes through it. Pop. (1876) 8,499.

Saint-Amour, Guillaume de, a famous doctor of the Sorbonne of the 13th c., was born at St. Amour in Franche-Comté. He was an active member of the Church, went to Rome to plead for the independent rights of the University of Paris, and wrote vigorously against the mendicant orders. He incurred the wrath of the Pope and of St. Thomas, but was popular with the French people. He died 13th September 1272. His works, the chief of which is *De Periculis Novissimorum Temporum*, were printed at Constance in 1622.

St. Andrews. See ANDREWS, ST.

St. Anthony's Fire. See ANTHONY'S FIRE, ST.

St. Arnaud. See LEROY.

Saint Augustine, a town in the E. of Florida, U.S., 2 miles from the Atlantic Ocean, 160 S. of Savannah, stands on a peninsula between the Matanzas and San Sebastian Rivers. S. A. is the oldest city in the United States, the Spaniards having landed here in 1512, and made it a permanent settlement in 1565, when it received its name in honour of 'the greatest of the Fathers.' It was ceded to the British in 1763, and remained in their hands till after the War of Independence. There is an old Roman Catholic cathedral of 1793. Fort Marion was commenced by the Spaniards about 1660, and finished in 1756. There is an old custom-house and a very handsome sea-wall built by the United States Government (1843). S. A. has a small trade in straw manufactures and some shipping. The pop., of which three-fourths are still Spanish, only amounted in 1870 to 1717.

St. Austell, a market-town on the S. coast of Cornwall, England, 40 miles W. of Plymouth by rail. It has a fine old church (restored 1870), and its district is rich in minerals, chiefly tin, copper, lead, and very fine china clay. There is a large pilchard fishery on the coast. Pop. (1871) 3803.

St. Bees, or **Kirkby Bea'cock**, a village in Cumberland on a bay formed by S. B. Head, 4 miles S. of Whitehaven by rail, with a pop. (1871) of 1122. It is the seat of a Church of England Theological College, founded in 1816 by Dr. Law, then Bishop of Chester, for the education of young men wishing to enter the Church, but unable to afford the expenses of Oxford or Cambridge. The Earl of Lonsdale, in 1817, fitted up as

* In the arrangement of articles, 'St.' is equivalent to the full form 'Saint.'

lecture-rooms, library, &c., the chancel of the chapel of an old Benedictine priory built in the reign of Henry I. to replace a still older nunnery founded by an Irish princess, St. Bega, in the 7th c., but destroyed by the Danes in the 10th c. The nave of the chapel has been used since 1611 as a parish church, where the students attend daily service. The college was intended originally to replace the 'priest class' of the northern grammar schools, where candidates for holy orders were frequently educated, but it has long ago enlarged its sphere. The Principal of the college, who is also vicar of the parish, selects the staff of lecturers, and has a right of personal supervision over the students who lodge in the village. The students in matters of discipline have a right to appeal to the visitor—the Bishop of Carlisle since 1871. The fees are £10 per term, there being four terms (January 28th to May 5th, and August 28th to December 5th), and the whole course occupying two years. The chief subjects of study are English divinity, the Greek Testament, and the composition of sermons. Students are admitted at the age of twenty-one, and the average attendance is about 60. The diploma of the college is now accepted in most English dioceses, and not merely in the N., as was at first intended. A new lecture-hall and library were built in 1863. There is a free grammar-school at S. B., founded by Archbishop Grindal in 1587. Possessing good sands and a grand rocky coast, S. B. has in recent years been resorted to as a watering-place.

St. Cassian Beds, an interesting series of rocks exposed at St. Cassian, on the southern flank of the Austrian Alps, and at Halstadt on the N., and attaining a thickness of about 800 feet. They are referable to the base of the Keuper or Upper Trias, in which they form the only well-developed marine deposit. They are exceedingly fossiliferous, having furnished about 700 species, many of them new and peculiar, but showing collectively a singular mixture of typical Palæozoic and typical Mesozoic forms.

St. Cathérine's, a town in the Dominion of Canada, province of Ontario, situated on Lake Ontario, at the mouth of the Welland Canal, 12 miles N. of the Falls of Niagara, and 34 miles S.E. of Toronto by rail. It has mineral artesian wells, a convent, marine hospital, and several fine hotels. There are 2 daily and 4 weekly newspapers. Iron wares, pottery, and cloth are manufactured, while there is shipbuilding and an important transit trade. Pop. (1871) 7864.

St. Charles, a town of the State of Missouri, U.S., on the Missouri River, 20 miles above its mouth, and 19 miles by rail from St. Lewis. It has thirteen churches, four newspapers, and ten schools. The Missouri is here crossed by an iron railway bridge 2 miles in length, with its approaches; erected at a cost of \$2,000,000. S. C. has extensive flour and starch mills, and breweries. Pop. (1870) 5570.

Saint-Cloud. See CLOUD, ST.

St. Croix, a river of the United States, flows E.S.E. from Grand Lake to Passamaquoddy Bay, separating Maine from New Brunswick. Length, 75 miles.

St. Croix, a tributary of the Mississippi, 150 miles long, forms a boundary between Wisconsin and Minnesota, and has famous falls.

Saint-Cyr, Laurent Gouvion, Marquis de, Marshal of France, was born at Toul, 13th April 1764. In 1792 he joined the French army as a volunteer, and rose rapidly during the campaigns on the Rhine and in Germany between that year and 1797. In 1794 he became a general of division, and in 1798 he received the command of the French troops in Rome. He subsequently distinguished himself in the German and Italian campaigns, and in the Peninsular War. He was not among the eighteen marshals created by Napoleon on his ascending the throne in 1804, but received his baton during the Russian campaign of 1812, when he gained a brilliant victory over Prince Wittgenstein at Polozk. In the disastrous Saxon campaign of 1813 he twice defended Dresden with much gallantry. On the news of his final capitulation being announced to Napoleon, a general standing by remarked, 'We have lost another 30,000 men.' 'Worse than that,' replied the Emperor, 'we have lost Saint-Cyr!' On the Restoration he was created a peer of France, and remaining faithful to the royalist party in 1815, was appointed Minister of War at the close of the Hundred Days. This office he resigned in a few months, but was reappointed in 1817, and introduced several important reforms. In 1821 he

retired from public life, and devoted himself to agriculture and to the composition of historical works. These are *Matériaux pour servir à l'Histoire de la Guerre d'Espagne* (Par. 1821), *Mémoires sur les Campagnes des Armées du Rhin et de Rhin et Moselle* (4 vols. Par. 1829), and *Mémoires pour servir à l'Histoire Militaire sous le Directoire, le Consulat, et l'Empire* (4 vols. Par. 1831). He died at Hyères, 10th March 1830. In personal character he was singularly upright and devoted to duty, while his military talents were rather suited to cautious and defensive, than to brilliant and aggressive, operations. See M. Gay de Vernon, *Vie de S.-C.*

Saint-Denis. See DENIS, ST.

Saint-Die. See DIE, ST.

Saint-Dizier. See DIZIER, ST.

Sainte-Beuve, Charles Augustin, was born at Boulogne, December 23, 1804. At the age of thirteen he proceeded to the Collège Charlemagne at Paris, and after studying medicine for some time, obtained a post in the hospital of St. Louis. About 1825 Dubois engaged him on the staff of the *Globe* newspaper, and one of his first contributions was a eulogistic criticism of Victor Hugo's *Odes et Ballades*. The step thus taken introduced him to the small circle of the 'romantic' poets, of whom Hugo was the chief. In 1828 he published a *Tableaux Historique et Critique de la Poésie Française au seizième Siècle* (new ed. 1870), and in the following year he produced some of his own poems in the romantic style as *Vie, Poésies et Pensées de Joseph Delorme*. These poems sufficed to stir up the fiercest strife between the classical and liberal or romantic schools of critics; but neither in them nor in S.-B.'s volumes of verse—*Les Consolations* (1830), *Pensées d'Août* (1837), and *Poésies Complètes* (1840: new ed. 1863)—is any real poetical genius discoverable. His true genius was critical, and Buloz was not slow in perceiving this, and engaging S.-B. to write for the *Revue des Deux Mondes*. Lammennais, too, manifested an interest in him, and influenced S.-B.'s strange novel *Volupté* (1834), an unpleasant study of the conflict between the flesh and the spirit. In 1837 S.-B. delivered at Lausanne a course of lectures, which afterwards took shape in his *Histoire de Port-Royal* (5 vols. 1840-60). In 1845 he entered the Academy; in 1848 he accepted a chair of literature at Liège; but on the accession of Louis Napoleon he returned to Paris as a contributor to the Bonapartist paper, *Le Constitutionnel*. In the columns of this journal appeared the famous articles reprinted under the title of *Causeries du Lundi* (15 vols. 1857-62). Never before or since has such newspaper writing been seen. Each of these essays is a learned and profound study of history. In the hands of S.-B. the most trifling character is shown to bear a significance in its times, the analysis of a book becomes a spiritual biography of its author, and the soberest, most unexaggerating criticism produces the fascination of fiction. A taste even among Frenchmen pre-eminently delicate, a keen appreciation of all that might be called social æsthetics, varied sympathies, a transparent love of truth and fairness, and an indomitable patience in the acquisition of facts, all graced by a perfect mastery of style, have made him the prince of critics. He indeed founded a school of criticism, the principles of which have been carried out—sometimes ludicrously far—by M. Taine. S.-B.'s other contributions to periodical literature have been collected under the titles of *Portraits Littéraires* (8 vols. 1832-39; new ed. 3 vols. 1864), *Portraits de Femmes* (1844), *Portraits Contemporains* (2 vols. 1846), and *Nouveaux Lundis* (10 vols. 1863-68). He likewise published an elaborate *Étude sur Virgile* (2 vols. 1857). S.-B. became a senator in 1865. He died October 13, 1869. A re-issue of his miscellaneous essays—critiques, causeries, portraits, &c., under the care of Emile Troubat—was completed in 30 vols., 1875. See *Correspondance de S.-B.* (vols. I., II., Par. 1878). Of the numerous biographical and critical notices of S.-B., which have appeared since his death, the most respectable is contained in M. Juste Olivier's *Mémoires*, published in the *Bibliothèque Universelle et Suisse Revue* for 1876.

Sainte-Marie-aux-Mines (Fr.), or **Markirch** (Ger.), a town of the German Empire, province of Elsass, on the Lièporette, 16 miles W. of Schlettstadt by rail. It has considerable wool and cotton factories. Its once rich silver mines are long since exhausted. Pop. (1875) 12,245.

Saintes, a town of France, department of Charente-Inférieure, on the left bank of the Charente, 45 miles S.E. of Rochefort by rail. It was the ancient *Mediolanum* of the Santones, and has interesting Roman remains, the chief of which are the ruins of a triumphal arch, circus, aqueduct, and an amphitheatre nearly as large as that at Nîmes. Pop. 1876) 11,150.

Saint-Étienne. See ÉTIENNE, ST.

Saint-Evremond. See EVREMOND, ST.

Saint-Germain-en-Laye, a town of France, department of Seine-et-Oise, on the left bank of the Seine, and on the outskirts of the great forest of Lyda or Laye (10,873 acres in extent), 6 miles N. of Versailles, and 15 miles W.N.W. of Paris by rail. It is mainly remarkable for the royal château built by François I. (1547) in place of an older edifice which dated from the reign of King Robert, and which was sacked by the English in 1346, 1419, and 1438. The French court resided here for part of the year from about the reign of Philippe-Auguste to that of Louis XIV. When the latter king reconstructed the château of Versailles, that of St.-G. became the refuge of James II., the exiled monarch of England, who here kept up the mockery of a court till his death in 1701. Since 1862 the château has been used as a museum of antiquities. Pop. (1876) 16,978.

St. Helena. See HELENA, ST.

St. Hel'ens, a town of Lancashire, England, 12 miles N. of Liverpool by rail. It is altogether modern, and owes its prosperity to the Sankey Canal (the first in England), which gives it transit to the Mersey, and to productive coal-seams in the vicinity. In 1872 the Lancashire and N. Western Railway made a branch, for the purpose of running the northern traffic from Huyton via Prescott and St. H. to Wigan. St. H. has very extensive manufactures of plate, sheet, crown, and flint glass, while the bottle-works of Messrs. Nuttall and Co. and Messrs. Cannington, Shaw, and Co. are the largest in Lancashire—if not in England. There are also large alkali, copper-smelting, and iron works. A handsome town-hall, comprising public offices, police-court, public library, &c., was opened in 1876. Pop. (1871) 45,134; (estimated, 1878) 55,000. As yet St. H. is not a parliamentary borough.

St. Helier, capital of the island of Jersey, Channel Islands, 9 hours by steamer from Southampton, and 33 from London, is defended by Fort Regent and Elizabeth Castle. There are also the ruins of an old hermitage, the traditional abode of St. Helier. S. H. has a court-house or meeting-place for the 'States-Assembly,' Victoria College (1851), a library, a prison, and handsome piers. There is some fishing and shipbuilding. Besides the parish church there are 5 Methodist, 4 Independent, 2 Roman Catholic, and several other meeting-houses. Pop. (1871) of town and parish, 39,756.

Saint-Hilaire, Geoffroy. See GEOFFROY, ST. HILAIRE.

St. Ives. See IVES, ST.

St. John's Bread. See CAROB.

St. John's Wort, a popular name of the type genus of the order *Hypericaceæ* (q. v.), and so called from being formerly gathered on the eve of St. John's day.

St. Jo'seph, a city of Missouri, U.S., on the right bank of the Missouri, 350 miles W. of St. Louis by rail. Founded in 1843 by Joseph Robidout, it was long an important Indian frontier station and halting-point for emigrants and gold-seekers on their journey W. It suffered heavily during the Civil War, but has since rapidly increased. There are now (1878) thirty-two schools and colleges, twenty-four churches, nine newspapers, five public libraries, &c. It is a great railway centre, and has a magnificent railway bridge, completed in 1873 at a cost of \$1,500,000. In 1875 its wholesale trade exceeded \$20,000,000. Pop. (1870) 19,565; (1874) estimated at 30,000.

Saint-Julien, a village of France, department of Gironde, near Bordeaux, and on the left bank of the Gironde, gives name to a light claret made in the neighbourhood. Pop. (1876) 1832.

Saint-Just, Louis Antoine Léon de, a notable French revolutionist, born at Decize, Nivernais, August 25, 1767, was educated at Soissons by the Oratorians, went to Rheims to study law, and afterwards returning to Decize, devoted himself to literature. He published two dull and somewhat licentious

poems, *Organt* (2 vols. 1789), and *Mes passe-temps, ou le Nouvel Organt* (1792), and a work entitled *Esprit de la Révolution et de la Constitution de France* (1791). On the outbreak of the Revolution he was sent to Paris to represent his commune at the Fête of the Federation, and through the influence of Robespierre he entered the National Convention in 1792, quickly declaring his extreme views, which may be gathered from his maxim that 'those who make half-way revolutions only dig their own graves.' After the defeat of the Girondists, he was appointed to the Committee of Public Safety, accompanied Le Bas as commissioner to the army of the Rhine, and established the guillotine in Alsace. In February 1794 he became president of the Convention, and with Couthon and Robespierre he formed the triumvirate of the reign of terror. With the other terrorists he ascended the scaffold on July 28. The austere purity of S.-J.'s private life heightens the interest with which his terrible public career is regarded. His *Œuvres Politiques* were republished in 1833-34. See Hamel's *Histoire de S.-J.* (Par. 1859).

St. Kil'da. See KILDA, ST.

St. Kil'da, a town in Victoria, situated on the E. side of Hobson's Bay, 3½ miles S.E. of Melbourne, with which it is connected by railway. It is much frequented for sea-bathing, and has been styled the Victorian Brighton. Pop. (1875) 9676.

St. Law'rence. See LAWRENCE, ST.

Saint-Lô, the chief town of the department of Manche, France, on the summit and slope of a rocky ridge which rises from the right bank of the Vire, 55 miles S.E. of Cherbourg by rail. It has still some remains of fortifications, and two interesting buildings, the fine ogival cathedral of Notre Dame, and the abbey church of Sainte-Croix, in Romanesque style. The town is said to be named after a St. Lô (*Laudus*), bishop of Coutance, and remained in English possession from 1346 till 1449. Besides manufacturing cottons, ribbons, lace, cutlery, &c., it has an active trade in grain, cattle, horses, and cider. Pop. (1876) 9519.

St. Louis, in the State of Missouri, the third city in the American Union, on the right bank of the Mississippi, 20 miles below its confluence with the Missouri. Its distance by rail from New York is 1097 miles; from New Orleans 750 miles. It was founded in 1764, and remained chiefly in French possession till 1804, when it passed to the Union with Upper Louisiana, of which it was capital. Its population was then mostly French, and the trade was chiefly in fur. In 1817 the first steamer began to ply on the Mississippi, and from that date its progress was exceedingly rapid. The slave-trade caused much excitement about 1822, but did not affect the prosperity of the city. A time of commercial depression, which extended from 1837 to 1847, together with floods, ravages of cholera (1848), and a terribly destructive fire (1849), slackened the rate of increase till 1851, when the introduction of railways gave it a fresh impetus. In 1877 S. L. had 111 churches, of which 28 were Roman Catholic, 18 Methodist, 16 German Evangelical, and 14 Presbyterian. There is a Roman Catholic cathedral, and a Roman Catholic archbishop has his seat here. S. L. is famed for the excellence of its educational institutions, chief among which are the St. Louis University (a Jesuit establishment), and the Washington University and Mary Institute (unsectarian). The denominational schools (36 of which are Roman Catholic) number upwards of 60, and about as many are included in the public school system, which supplies instruction for nearly 40,000 pupils, employs 800 teachers, and is supported at the rate of nearly \$900,000 per annum. There are also a Western Academy of Sciences, a Polytechnic and a Mercantile Library (with 33,000 volumes), numerous hospitals and industrial homes, and a lunatic asylum (cost, \$900,000). The other principal public structures are the Custom House being constructed (1878) at a cost of \$4,000,000, the Exchange (completed 1878), with a hall 223 feet by 93, the Four Courts (comprising a prison and criminal courts), and the Court-house, a cruciform building (cost, \$1,280,000). The magnificent iron railway bridge over the Mississippi is 2225 feet long, and has a central span of 520 feet. The steel and iron used in its construction amounted to 5600 tons, and its entire cost was \$10,000,000. S. L. has 57 banks, with a capital of \$19,559,542, and annual bank-clearings of

St. L. 151,372,654. S. L. is in the centre of a large coal and iron field, and its iron trade is one of the most extensive in the world. The capital employed in this industry amounts now to nearly \$200,000,000. S. L. also exports vast quantities of machinery, flour, meat, and timber. It is a great shipping station, and at its wharves, which extend 11 miles along the river, there arrived, in 1876, 2200 steamers and 743 barges, with aggregate freights of 663,525 tons, while the merchandise received and despatched by rail amounted to 3,232,770 tons. The waterworks supply more than 20,700,000 gallons a day. S. L. is surrounded by several splendid parks, of which the largest is Forest Park, covering 1374 acres, and the finest Tower Grove Park, of 350 acres. The value of real and personal property is estimated (1876) at \$166,999,660. Pop. (1810) 1400; (1840) 16,469; (1850) 74,439; (1860) 185,587; (1866) 204,327; (1876) 498,182.

Saint Lou's, the capital of the French possessions in Senegambia, is situated on a sandy island, 2500 yards long, 5 miles from the mouth of the river Senegal. It is fortified, and has a considerable trade, but is dirty and poorly built. Pop. (1875) 15,748, of whom only a very small number are whites.

St. Lucia. See LUCIA, ST.

Saint-Malo, a fortified seaport of France, department of Ille-et-Vilaine, at the entrance of the Rance into the English Channel, 44 miles N.N.W. of Rennes by rail. It completely covers the Rocher d'Aaron, 3 miles in circumference, and is connected with the mainland by Le Sillon, a causeway 215 yards long. The harbour, which is spacious, is left dry at ebb tide, but the flood tide here rises from 45 to 50 feet, and a basin is now (1878) under construction at a cost of 5,000,000 francs. The town is defended by several strong forts, situated on the mainland and on the rocks that stud the roads. In 1877 there entered the port 489 British vessels, with cargoes to the value of £94,788, and cleared 474 with cargoes valued at £176,302 (these are exclusive of the steamers in the service of the London and South-Western Company). The exports include grain, apples, cartridges, and lead ore; the imports, coal, pig-iron, cement, hemp, and planks. S.-M. has considerable shipbuilding, and sends forth many vessels to the whale, cod, and mackerel fisheries. There are also manufactures of spirits, oils, cordage, chains, biscuits, tobacco, &c. Pop. (1876) 10,061.

St. Maurice River, a northern tributary of the St. Lawrence, which rises 216 miles N.N.W. of Montreal, and flows in a southerly course 363 miles to the St. Lawrence at the city of Three Rivers in the province of Quebec. It is navigable for steamboats about 66 miles from a point 34 miles above its mouth. Its valley contains iron mines and great forests, where about 500,000 logs of pine and spruce are cut annually. The Falls of Shawenegan, 180 feet in height, 22 miles above its mouth, are said to be the finest in Canada with the exception of Niagara.

St. Michael's, the largest, most populous, and most fertile of the Azores (q. v.), is situated in lat. 37° 44' N., long. 25° 30' W. Area 297 sq. miles; pop. 81,000. The island is 40 miles long and from 5 to 10 miles in breadth. It is of volcanic origin, and is mountainous in the interior, rising in Pico di Vara to 3570 feet, and in Sero da Agoa de Pas to 3070 feet. The climate is mild and healthy, and the soil is fertile, yielding abundant wheat, Indian corn, and beans, which are exported to Portugal. The staple articles of produce, however, are oranges and fruits. In 1876 the island exported to England 273,181½ large boxes of oranges valued at £136,580, 4800 malotes of tangerines, 694 bunches of bananas, and 29,553 pine-apples. In the same year the imports from Great Britain and British colonies amounted to £48,527, being £16,521 less than in 1875, and of this coal amounted to £2710. The total number of British vessels which entered the ports of St. M. in the same year was 132 of 35,960 tons, and cleared 138 of 37,170 tons; and of the vessels that cleared 127 (with cargoes valued at £129,716) were in the direct trade between Great Britain and British colonies.

St. Michael's Mount, a granite rock off the S. coast of Cornwall, England, near Penzance, communicating with the mainland by a causeway passable at low water, is 1 mile in circumference, and fully 200 feet high. It was mentioned by Pliny, and by Diodorus Siculus, who called it Bellerium, and knew it was near the Cassiterides. It was a place of much note among the ancient Britons; and after Christianity was introduced formed

a common pilgrims' goal. The apparitions of St. Michael and other legends about it have been frequently mentioned by poets, e.g. Milton in *Lycidas*. It is crowned by a castle which was the subject of contest during the Civil War and at other times, and which is now occupied by Sir J. St. Aubyn. There is a small fishing village (pop. about 127) at the base of the rock. The formation of St. M. M. is of great interest to the geologist, and the botanist finds many rare plants upon it.

Saint-Michel, Mont, a conical granite rock in the French department of Manche, which rises to a height of 400 feet from the sands of Cancale Bay, 7 miles W. of Avranches. On its summit are a church and a castle, and on the steep slopes is built the town, which has a pop. of 200. The surrounding sands are under water at every tide, but at low water there is a road 1 mile in length which joins it to the mainland. On the rock, which was called *Tumba*, stood in ancient times a temple of Jupiter; and in the time of the Normans it was the site of a strong fortress. An apparition of St. Michael here in 708 led to the building of a church by Auxbert, Bishop of Avranches, which is spoken of as *in monte tumba*. To the monastery here was given soon after the Conquest the Cornish Mount St. Michael and its priory, by Robert, Earl of Mortain and Cornwall, half-brother of William the Conqueror. See *Les Curieuses Recherches du Mont-St.-Michel*, by Dom Thomas Le Roy (2 vols. Caen, 1878).

Saint-Nazaire, a seaport of France, department of Loire-Inférieure, at the mouth of the Loire, and on the right bank, 40 miles W. of Nantes by rail. It has grown more rapidly in recent years than perhaps any other French town, its pop., 2391 in 1851, having increased in 1861 to 6500, and in 1876 to 14,761. A chief cause of its prosperity is the gradual silting up of the Loire, which has led to the formation here of large docks to save vessels destined for Nantes the troublesome navigation of the river. With the exception of coal, most of the cargoes are forwarded in transit by rail or in barges to Nantes, where the duties are payable. There are regular weekly steam lines hence to London, Hamburg, and Santander, and fortnightly to Liverpool; and from this port also sail the mail steamers for Colon, Vera Cruz, and the W. Indies. In 1876 there entered 299 British vessels of 116,513 tons, and cleared 237 of 96,124 tons. One of the largest docks in France is now (1878) in process of construction here, but will not be opened till 1880.

St. Neots, a town of England, county of Huntingdon, on the Ouse, 8 miles from Huntingdon, and 52 from London by rail, has some manufactures of lace. There is a parish church built in 1507. S. N. is named from a monastery founded here in 974. Pop. (1871) 3200.

Saint Nicolas, a town of Belgium, province of E. Flanders, in the middle of the fertile and populous Pays de Waes, at the intersection of the Ghent-Antwerp and the Mechlinheuzen railways, 12 miles E.S.E. of Antwerp. It has a great flax market, and large manufactures of cotton, woollen, and silk stuffs, linens, carpets, shawls, laces, and tobacco. Pop. (1874) 24,567.

Saint-Omer, a strongly fortified town of France, department of Pas-de-Calais, on the left bank of the Aa, 177 miles N.N.W. of Paris by rail. It is surrounded on three sides by marshes, and has four forts. The chief buildings are the church of Notre-Dame, the hospitals, the museum, with a rich collection of coins and antiquities, the barracks, the theatre, and the remains of the splendid abbey of St. Bertin (built 1320-1520; restored 1792). It has a library of 15,000 volumes, and is the seat of the famous antiquarian society, *La Morinie*. S. has flax, wool, and cotton spinning, and salt-refining; and manufactures lace, tobacco, leather, paper, beet-sugar, brandy, and clay-pipes. Pop. (1876) 21,404. S.-O. was during the penal times the seat of a college for English Catholics.

Saint-on-Dolby, Madame Charlotte Helen, an English contralto singer, was born in London in 1821, and was educated at the Royal Academy of Music, where she became King's Scholar in 1836. On leaving that institution she proved herself one of the most accomplished and cultivated of native artists, and immediately took high rank as a concert and oratorio singer. Mendelssohn formed an appreciative opinion of her powers, engaged her at the Gewandhaus concerts at Leipzig in 1846-47, and wrote the contralto part in *Elijah* for her. Till her retirement in 1870 she enjoyed a great and deserved popularity. Her style was marked by declamatory power, correct expression, and

extraordinary versatility. Many of the choicest modern songs have been introduced by her, while she has few equals in the rendering of the simple English ballad. She is married to Mons. Prosper Philippe Catherine Sainton, the celebrated violinist, at present leader in Her Majesty's Theatre, who was born in Toulouse in 1813, and has been for many years identified with the Italian Opera in London.

St. Pan'cras, a very extensive parish in the N. of London, including the suburbs of Camden Town, Kentish Town, &c. Area, 2716 acres. Pop. in 1871, 221,465. The parish church is one of the finest in the metropolis. St. Pancras gives its name to the terminus of the Midland Railway Company, and the gigantic hotel attached thereto.

St. Paul, capital of Minnesota, United States, on the Mississippi, was founded in 1838 and incorporated in 1849. It has 38 churches, 3 libraries, 2 theatres, and 2 daily and 9 weekly papers. It has a good educational system, with 13 schools and 5000 scholars. There are several fine public buildings, chief among which is the State Capitol. There are seven banks, several hospitals and asylums, a large custom-house, and a fine park of 260 acres. The chief manufactures are machinery, furniture, boots and shoes. Pop. (1850) 1083; (1870) 20,030. The assessed valuation of property was \$27,000,000 in 1878.

Saint-Paul, a town in the island of Réunion (q. v.). Its pop. at the census of 1876 was 26,979.

St. Paul de Loanda. See SÃO PAULO DO LOANDA.

St. Petersburg, a government of W. Russia, includes the old Ingermanland, with parts of Karelia and the Grand-Duchy of Novgorod, and is surrounded by the Gulf of Finland, Finland, Lake Ladoga, and the governments of Olonetz, Novgorod, and Pokov, Lake Peipus, and Esthonia. Area, 17,065 sq. miles; pop. (1870) 1,326,875. St. P. is a plain, sloping to the N.W. About half the surface consists of woods, marshes, and lakes. The chief rivers are the Neva (q. v.), the Volchov, which runs into Lake Ladoga, and the Narova, which drains Lake Peipus, receives the Plussa, and flows past Narva to the Gulf of Finland. Timber is the chief product of St. P.

St. Petersburg, the capital of the Russian Empire, occupies the delta of the Neva on the Gulf of Finland, and is intersected by ten branches of the river and numerous navigable canals. It is 400 miles N.W. of Moscow, and 20 miles E. of Kronstadt (q. v.). No European capital, save London and Vienna, impresses the mind with such a sense of wealth, power, and ostentation as the city of St. P. From near Kronstadt the river appears wide as an estuary, and thronged with shipping like the Tagus or the Thames, while to the traveller approaching St. P. by land the city seems 'a magnificent artificial oasis in a waste, howling wilderness of forest and morass.' Its wide, regular, and ill-paved streets on perfectly level ground wear, like those of Berlin, a general look of stiffness and symmetry suggestive of bureaucracy and military discipline, and the large scale on which St. P. is planned, with the prevalence of a certain pretentious and pseudo-classic architecture, reminds one irresistibly of Munich. Even the private houses are built in great blocks, each having a *ivoornik* or porter, who also acts as a police-agent, and by night as a watchman. The city covers an area of 42½ sq. miles. It consists of two parts, the 'Great Side' (*Bolshaya Storona*), on the S. bank of the Great Neva, and the 'Petersburg Side,' scattered over the N. bank and the islands, chief of which is Vassiliostrof ('Basil Island'), connected with the S. bank by three bridges of boats and the magnificent Nikolaievsky bridge (1850) of granite, resting on seven arches, and 1200 feet long. Communication is also kept up by the Annichkoff bridge, 110 feet long, and 150 other wooden bridges built on piles, by steam-launches and two-oared ferry-boats in summer, and by sledges in winter, when the jolting little *droshkies* (14,105 in 1874) are out of use. The river-banks are lined with quays of red granite, which for solidity, strength, and area are without parallel in Europe. On the S. bank these form a promenade, on Vassiliostrof they are used as wharves. The E. point of this island, where stand the Custom-House and the Exchange, is the chief resort of the foreign merchants, in whose hands are the export and import trade of St. P. On the same island are the Academy

of Sciences, founded in 1728 by Peter the Great, with a library of over 200,000 vols., and great scientific collections, the University (1819), which in January 1878 had 86 teachers and 1425 students, and the Academy of Fine Arts (1764), dominated by a colossal Minerva, and in its various squares are the monument of Count Romanoff, the colossal statues of Kutosoff-Smolensky, Barclay de Tolly, and Suvaroff-Rymnikski (in the Zarizyn Square or Field of Mars, where 40,000 men can manœuvre), the Cathedral of St. Nicholas, and a monument to Catharine II., erected in 1873. On an island a little higher up the river is the Fortress, built by Peter the Great in 1708, which surrounds the mint, the arsenal, and the buildings of the Military Department. On an adjoining island is the little wooden house occupied by Peter the Great during the founding of St. P. The central point of St. P. is the Admiralty, built by Alexander I., with one front to the Neva, the other facing the magnificent Admiralty Square, the largest in the city, where also rises the Winter Palace, rebuilt by Rastrelli in 1839, after the fire of 1837, a square edifice 455 feet long by 350 broad, the lavishly-adorned residence of the Emperor. Near and also facing the Neva is the palatial museum of the Hermitage, designed and constructed by Klenze (1840-51), containing vast art and antiquarian collections, including 1500 pictures, 11,880 sketches, 1890 vases, 200,000 coins and medals, 361 ancient marbles, a library of 120,000 vols., and one of the largest collections of gems in the world. The style is bastard Grecian externally, grotesque and florid Renaissance in the portico (which is sustained by 10 colossal caryatides), and in the interior, which has 140 monoliths of Finland granite, while the noble entrance-hall is supported by 16. The three central galleries are assigned to the Spanish school (over 100 pictures), to the Italian school (327), and to Rubens (60) and Vandyck (34). Rembrandt is represented by 41 pictures. Here also is the famed Kertch Collection of antiquities, taken since 1825 from fifty-eight Greek tombs in the Cimmerian Bosphorus. Between the Winter Palace and the imposing quarters of the General Staff stretches Palace Square, with the Alexander Column, 150 feet high, whose shaft is a monolith of red granite 80 feet high. W. of Admiralty Square are the buildings of the Directing Senate and of the Holy Synod, and stretching S.W. is Peter's Square, with the Nicholas Monument and the magnificent equestrian statue of Peter the Great, and the Cathedral of St. Isaac, completed in 1859, a huge building in Renaissance style, 330 feet long, 290 feet broad, and 310 feet high, with monolithic pillars of red granite, the interior of which is marred by gaudy ornament. From Admiralty Square extends S.E. the finest street of St. P., the Nevsky Prospect, 4 miles long and 130 feet broad, lined with palaces and rows of trees, the chief promenade and line of traffic. In the Nevsky Prospect is the Imperial Public Library (1810), which in 1868 contained 1,044,045 vols., 34,178 MSS., and 85,691 engravings. No city in the world can compare with St. P. in the number of its palaces. The most noteworthy, after the Winter Palace, are Peter's Palace, an unpretentious two-storied house in the Summer Garden; the Annichkoff Palace (1748), on the Nevsky Prospect and the Fontanka Canal, the residence of Nicholas I., now of the heir-apparent to the throne; the Marble Palace (1783), on the Great Neva, now belonging to the Grand Duke Constantine; the splendid Palace of the Grand Duke Vladimir (1871), also facing the Great Neva; the Tauric Palace in the E. of the city, built by Catharine in 1784; the fortress-like Michailoff Palace (1800), on the Fontanka Canal; the new Michailoff Palace (1825), and the Leuchtenberg Palace (1838), on the Moika Canal. After St. Isaac's, the chief churches are the Kasan Cathedral in the Nevsky Prospect, with numerous relics and military trophies, the Church of St. Peter and Paul, with a gilded spire 208 feet high, the Church of the Transfiguration, whose court is surrounded by 300 Turkish and French cannon, and the Vladimir church, with five gilded cupolas. St. P. has in all 139 churches (44 of wood) and 51 chapels, besides 30 of other denominations. The Alexander Nevsky monastery, in the E. part of St. P., incloses four churches, a considerable library, and an ecclesiastical college with 1000 students. St. P. is richly provided with scientific and practical schools. The most important benevolent institutions are the Foundling Hospital, and the Obuhoff and Nicolai Infirmarys. St. P. has no less than 25 cemeteries. There are six imperial and two private theatres. The largest are the Grand Theatre (finished 1832), holding 4000 persons, for Italian opera and the ballet; the Maria Theatre (2000), for Russian dramatic

works, and the Alexander Theatre (1700). The Ciniselli Circus was erected in 1876 at a cost of £40,625. The public gardens are numerous and tasteful. The chief are the Summer Gardens, the Alexander Park (the newest and finest), the Tauric Garden, and the Botanical and Zoological Gardens. St. P. is one of the most important manufacturing towns of Russia. In 1872 it had 621 imperial and private manufactories, with 41,164 workmen, producing goods worth £13,267,762. The manufactures include carpets, mirrors, bronze wares, locomotives, glass, porcelain, soap, leather, stearine, flax, and yarn. The trade of St. P. is also very important, though the river is only open from the middle of April to the middle of November, and a bar across its mouth prevents vessels drawing more than 9 feet of water from reaching the city. The total number of vessels entered at St. P. and its out-port Kronstadt in 1874 was 2899; and cleared, 2823. Of these 945 were English. The chief exports are corn, flax, linseed, tallow, hemp, bristles, potash, Russia leather, spirits, wood, bones, and oil-cake. In 1873 they amounted to £15,694,001, while the imports were valued at £2,339,770. St. P. has five railway stations, where the Baltic, Zarskoe, Moscow, Viburg, and Warsaw railways terminate. The district around St. P., notwithstanding the severe climate (the winter temperature averages 18° F., and has sometimes fallen as low as -51° F.), is studded with country seats and fine gardens. Further off are the Imperial pleasure-palaces of Zarskoe-Selo, Paulovsk, Strelina, Gatchina, Peterhof, and Oranienbaum, and the village of Pulkova with its famous observatory. St. P. was founded as a fortress by Peter the Great in 1703, and was declared his capital in 1712. Catharine II. made it one of the most brilliant capitals of Europe, and an important industrial and commercial centre. It grew rapidly under the government of Alexander I., who built a considerable number of bridges, and did great service by draining the swamps. The pop. of St. P. (according to the *St. P. Calendar* for 1878) is 667,963, of whom 524,329 are Russians, 45,515 Germans, 13,749 Finns, 9796 Poles, and 5001 Swedes. The Orthodox Greeks number 557,173, Protestants 76,831, Roman Catholics 20,882, Israelites 6654, Raskolniks, 3138, and Mohammedans 2071. Of the pop. 54,398 belonged to the hereditary, and 40,186 to the personal nobility; 38,363 were of the military, and 207,000 of the peasant class. See *Sehenswürdigkeiten von St. P.* (3 parts, St. P. 1870-71); J. Beavington Atkinson, *An Art Tour to Northern Capitals of Europe* (Lond. 1873); Mackenzie Wallace, *Russia*, (vol. ii. 1877).

St. Peter's Port, the capital of Guernsey, Channel Islands, contains Government buildings, a college library, handsome piers, &c. There are three episcopal churches, and numerous dissenting chapels. Pop. of town and parish (1871) 16,166.

Saint-Pierre, a town in the French island of Martinique, in the W. Indies, on a bay of the W. coast, 16 miles N.W. of the capital Fort-la-France. It has a good harbour, several handsome churches, a theatre, &c., and carries on an active trade in sugar, rum, and coffee. Pop. 25,000.—**St. P.** is also the name of the second largest town in the French island of Réunion (q. v.), which has a pop. (1876) of 30,615.

Saint-Pierre-lès-Calais, a town of France, department of Pas-de-Calais, about a mile inland from Calais, has manufactures of linens, tulles, leather, beet-sugar, &c.; and a pop. (1876) of 22,349.

Saint-Pol-de-Léon, a town in the department of Finistère, France, near the coast of the inlet which receives the small river Perze, 10 miles N.W. of Morlaix. It has a grand Gothic cathedral of the 13th c., and an imposing church of Notre Dame de Creizker, dating from the 14th c. There are industries in linen, flax, hemp, wax, &c. Pop. (1876) 3503.

Saint-Quentin. See QUENTIN, ST.

Saints' Days. See SAINT.

Saint-Servan, a small seaport of France, department of Ille-et-Vilaine, at the mouth of the Rance, opposite to St. Malo, with which it is connected by land at low-water. It is a new town with two harbours, the largest of which is Port Solidor, and is much frequented as a watering-place. An Anglican chapel was built here in 1875. It has shipbuilding and trade in timber. Pop. (1876) 9912.

Saint-Simon, an ancient French family, whose family name

was derived from a seignury in Vermandois. Its two most famous members were—(1) **Louis de Rouvrol, Duc de S.-S.**, born at Versailles January 16, 1675, entered the army when scarcely sixteen, and distinguished himself on several occasions during the war of the Augsburg League. Disappointed of a brigadier-generalship, he resigned his commission in 1702, and on the death of Louis XIV. he aided the Duc d'Orleans in seizing the regency, and was himself appointed a member of the regency council. S.-S. was a staunch Jansenist, opposed the Jesuits, warned the people against the financial schemes of Law, and strove to counteract the machinations of Dubois. On the death of Orleans and the accession to power of Louis, the old *grand seigneur* retired from politics, and occupied his remaining years in writing his *Mémoires*. He died March 2, 1755, at Paris. He had ordered that his inimitably graphic *Mémoires* should not be printed for forty years. Fragments of them first appeared in 3 vols. 1788, followed in 1789 by 4 supplementary vols. The first complete edition is that of 1829-30, in 21 vols., printed by command of Louis XVIII. The best is that of Chérueil, with introduction by Sainte-Beuve (20 vols. 1856-57; new ed. by Chérueil and Regnier, 20 vols. 1872 et seq.) English selections by Bayle St. John were published in 4 vols. 1857; new ed. 3 vols. 1876. See Pontalis, *Discours sur la Vie et les Œuvres de S.-S.* (1855), and Chérueil, *S.-S. Considéré comme Historien de Louis XIV.* (Par. 1865).—(2) **Claude Henri, Comte de S.-S.**, grand-nephew of the preceding, born at Paris, October 17, 1760, entered the army and was made a captain before the age of seventeen. In 1779 he went to America, fought under Bouillé and Washington, was made prisoner with the Comte de Grasse in 1782, and on the conclusion of peace returned to France, obtaining a colonelcy in his twenty-third year. After visiting Holland and Spain he arrived in Paris just in time to witness the outbreak of the great Revolution. He says that he took no part in the stirring events which followed, but remained an interested spectator. At anyrate he adopted the plain name of Citizen Bonhomme, and in partnership with Baron von Redern he made enormous profits by buying and selling confiscated or national property. But in 1797 Redern quarrelled with his partner, and managed to get quit of him for £6800. With this little fortune S. S. began the real study of sociology. He studied the whole circle of the sciences until perfectly acquainted with all, in his own estimation; he married, just as an experiment, and ere long obtained a divorce; he gambled, and played the debauchee; he gave balls and dinner-parties in rapid succession; he attempted to realise old age artificially by means of medicaments, and even inoculated himself with contagious diseases. His scheme of human existence was—(1), To spend one's vigorous youth in a manner the most original and active possible; (2) to gain a knowledge of all human theories and practices; (3) to mingle with all classes of society, placing one's self in all possible situations, and even creating situations that do not exist; (4) to spend one's old age in resuming one's observations, and in establishing principles. £6800 was too small a provision for such a programme, and in 1808 S.-S. at the age of forty-eight was glad to receive a clerkship in the government pawn-broking office, with a yearly salary of £40. The charity of friends supported him in misery, and precisely when his circumstances were most wretched he pursued his socialistic dreams most enthusiastically. In his *Lettre d'un Habitant de Gênes à ses Contemporains* (1803), he had propounded a compendium of his system as follows: 'The spiritual power in the hands of the *savans*; the temporal power in the hands of the men of property; the power of naming the individuals called to perform the functions of leaders, in the hands of the masses; for salary to the governing class, the consideration which they receive.' This system, still more briefly put by its author thus, 'To each man a vocation according to his capacity, to each capacity a recompense according to its works,' he continued to elaborate, with many extravagances, in the *Introduction aux Travaux Scientifiques du Dix-neuvième Siècle* (1807); *Prospectus d'une Nouvelle Encyclopédie* (1810); *Réorganisation de la Société Européenne* (1814); *Opinion sur les Mesures à Prendre contre la Coalition de 1815*, and *L'Industrie, ou Discussions Politiques, Morales et Philosophiques* (4 vols. 1817-18). The last three works were in part written by Augustin Thierry, his disciple. His *Opinions Littéraires, Philosophiques, et Industrielles* (1820), *Système Industriel* (1821), and his *Catéchisme des Industriels* (1824), continued the exposition of his doctrines, which were formulated in his great work *Le*

Nouveau Christianisme (1825), and kept before the eyes of the public in a journal called *La Producteur*. This strangely philanthropic egotist, who believed that he had transformed society into a church universal, developed Christianity to its final issues, and accomplished the salvation of the world, died on the 19th of May 1825. His last words were:—'It has been imagined that all religion whatever ought to disappear; but religion cannot disappear from the world; it can only change its form. Do not forget that in order to do great things one must be enthusiastic. My whole life sums itself up in a single thought—'To assume to all mankind the freest possible development of their faculties.' The future is ours.' The same thought is expressed in his well-known saying, 'The golden age is before us, not behind us.' It was more than the contagion of an insane enthusiasm that drew around St. S. such men as Comte, Thierry, Rodrigues, Bazard, Enfantin, Armand Carrel, Michel Chevalier, Barrault, and Talabot. In 1831 these founded the *Globe* newspaper, which disseminated the broadest socialism throughout the land. Soon, however, the Saint Simonian Church was torn by schism. The two leaders, Bazard and Enfantin, fell out regarding the emancipation of women, and Enfantin continued to head the old society on the principle of the equality of the sexes, and proclaiming almost perplexedly that 'the only position of the true Saint Simonian with regard to woman is to declare his incompetence to judge her.' Enfantin finally made it the aim of his association to find a woman of genius who would reveal a new future to humanity; balls and fêtes were given to all the fair Parisiennes. These eagerly came, but among them no inspired prophetess; and the funds of the society being dissipated, the *Globe* was abandoned and the Saint Simonian establishment in the Rue Monsigny—a sort of socialist monastery—broken up. Enfantin and about forty others formed themselves into a band of mystics, who entered their meditations in a manuscript called *Le Livre Nouveau*. These meditations were shaped into a body of rhythmical metaphysics, or, as Reybaud puts it, 'an algebra of religion,' expressed in Biblical language. But in August 1832 this association was dispersed before the Cours d'Assises. His *Œuvres Complètes* were published at Paris (20 vols. 1865–69). See *Essai sur la Doctrine de St.-S.*, prefixed to his *Œuvres Choisies* (Bruss. 1859); Hubbard's *St.-S.* (Par. 1857); and Fournel's *Bibliographie Saint-Simonienne* (Par. 1833).

St. Thom's, one of the Virgin Islands, and one of the three Danish possessions in the W. Indies. Area, 45 sq. miles; pop. (1870) 13,854, of whom one-twelfth are whites. The island is formed by a volcanic ridge, extending E. and W., and attaining a height of 1480 feet. It is girt by barren rocks or 'keys,' and about 2 miles N.E. lies the almost deserted and harbourless island of St. John's, with a pop. (1870) of 1054. To the W. 37 miles is Porto Rico, and 40 miles S. is the Danish St. Croix. The light sandy soil of the island, though it has been proved capable of producing grapes, oranges, cotton, ginger, &c., now (1878) only yields a few inferior vegetables, a little bad fruit, and some Guinea grass. The town of St. T. had a pop. (1870) of 11,681, but is only noteworthy on account of its excellent harbour, which is of the first importance as a calling station for mail steamers, a coaling port, and a refuge for vessels in distress. A floating dock, completed in December 1875, is 250 feet long by 70 broad, with a draft of 20 feet. In 1876 there entered 3519 (29 in distress) vessels, and cleared 3655; while of these, British vessels numbered 1250, with an aggregate of 360,000 tons, and the imports (coal, drygoods, spirits, &c.) amounted (1875) to £911,842.

St. Thom's (Port. *São Thomé*), an African island belonging to the Portuguese, lies in the Gulf of Guinea. Area, 140 sq. miles; pop. (1875) 29,441 (1000 whites and mulattoes). Of volcanic origin, S. T. is rugged and densely wooded, but very unhealthy. Sugar as the principal crop has recently given place to coffee. Cabinet woods of fine quality are also among the exports. The chief town, S. T. or Chavres, is a bishop's seat, and has some 4000 inhabitants, including a garrison (1875) of 27 officers and 399 men.

Saint Thom's's Mount, a town in the district of Chingleput, Madras, British India, 10 miles S. W. of Madras city. Pop. (1871) 15,490. It is generally known as 'the Mount,' and contains the headquarters of the Madras artillery. It must not be confounded with St. Thomé or Mailapur, a little port about 7 miles further N., which has now been included within the

suburbs of Madras city. Both these spots lay claim to be the scene where St. Thomas, the apostle of India, suffered martyrdom, and are accordingly much frequented by Oriental Christians.

St. Vincent, one of the British W. Indian islands, 100 miles W. of Barbadoes, has an area (according to the new Statistical Abstract, &c. 1877) of 147 sq. miles and a pop. (1871) of 35,688, of whom 2500 are whites. It is picturesque and fertile, and is traversed from N. to S. by a volcanic range, which attains its greatest height of 3000 feet in La Soufrière. The climate is hot and humid, but not unhealthy. Two-fifths of the whole area are under cultivation, and the chief exports are sugar, rum, and molasses. In 1874 the total exports amounted to £188,916 (£123,752 of sugar alone), and the imports to £160,772, while the public revenue was £27,441 and the expenditure £29,788. The vessels that entered and cleared the ports in 1874 had an aggregate tonnage of 79,901 tons. The chief town is Kingston (q. v.).

St. Vincent, Cape, a lofty headland in the S.W. of Portugal, noted for the naval victories gained there. In 1693 Admiral Rooke was defeated by the French, in 1780 Admiral Rodney defeated the Spaniards, and on the 16th of February 1797 Admiral Sir John Jervis scattered the Spanish fleet in a great battle, ever since known as *the battle of C. St. V.*

St.-Vitus' Dance. See CHOREA.

Saïs, now called **Sa-el Hagar** ('Sa of the Stone'), a city of ancient Egypt, in the Delta, on the right bank of the W. or Canopic branch of the Nile. The modern village lies somewhat to the S. of the mounds of ruins. At the village itself are some remains of a thick brick wall. The 24th, 26th, and 28th dynasties of Manetho originated here. S. was also a religious centre of ancient Egypt, and its colleges were famous for the learning and sanctity of their priests. It was much visited by the Greeks, and had even a considerable resident Greek population.

Sais'an. See ZAISAN.

Sakhalin (native name *Taraika*), an island belonging partly to Russia and partly to Japan, lying opposite the mouths of the Amur, and separated from Yesso by the straits of La Perouse, and from Asiatic Russia by the Channel of Nevelski and the Channel of Tartary. Area, 22,642 sq. miles; pop. 13,000 (Russians, 3000; Japanese, 3500; Giliacks, 3000; Ainos, 3000; Orokops, 400; Chinese, 100). Although pronounced an island by La Perouse in 1787, it was laid down on English maps as a peninsula until 1857, the separating straits of Mamio Rinzo, 4 miles in width, having been surveyed by Captain Nevelski in 1852. The island, from Cape Elizabeth in the N. to Cape Crillon in the S., is 514 miles long, with a breadth varying from 78 to 17 miles. A range of hills (2000 feet), called in the N. Vakazey, extends down its whole length, and is generally covered to the top with thick forests. In the middle is a parallel range, the Tiara Mountains. In the S. half the highest points are Koshka, Bernizet, and Ichara (4000 feet). The principal rivers are the Poronai and Timir, which rise near each other and flow the one to the N., and the other to the S., the latter falling into Tarpenia Bay. The lakes are mostly small, and united with the sea by deep narrow channels. The largest are Lake Tunaicha, 37 sq. miles, Lake Taraika, 28 sq. miles, and Lake Baikal, 23 sq. miles. S. is rich in timber, especially along its W. shores, and has rich deposits of a coal containing 60 to 70 per cent. of pure carbon. The mines at Dui and Sertunai are worked by the hard-labour exiles. The chief articles of export are fish (to Japan) and skins; 24,000 otters', 1300 sables', and 6000 foxes' skins being exported annually. The mean temperature of S. at Kusunai, in lat. 48°, is 34° F. The hottest month, July, has a temperature of 62° F., and the coldest, January, of 14° F. The principal Russian stations are at Korsakoff, Mouravieff, Dui, Sertunai, Kusunai, and Takoi; the Japanese live in the S. part of the island, and have their principal stations on the W. shore, near Mauka Bay and Suranusi, near Cape Crillon. The latter have also erected posts at all the Russian points S. of 48° lat. The Giliacks inhabit the N. part of the island, and the Ainos the S. part, from 50° lat. See *On the Island of S.*, by Colonel Veniukof (translated from the Russian *Poyemni Sbornik* by Captain Spalding), in the *Journal of the Royal Geographical Society*, vol. xlii. (1872); and J. M'Carthy's abstract of the *Kita Yae Dzusetan* ('Illustrated Descriptions of Japan'), by Mamia Rinzo (pub. 1855), in the *Geographical Magazine* for August 1878.

Sakhalin-Ula-Choton, the Manchurian name of the place known to the Chinese as **Hei-lun-tsian**, and properly called **Aigun**, lies on the right bank of the Amur, not far from Blagovestchensk, the capital of the Russian possessions on that river. It is surrounded with palisades, has a citadel, is the seat of a Chinese governor, and the headquarters of the Chinese 'flotilla of the Amur.' S. has considerable trade. Estimated pop. (1868) 5000. Here, May 28, 1858, a boundary treaty between the Russians and Chinese was concluded.

Sākhyā-mūnī, ('the hermit of the tribe of Sakhya'), the name by which Gautama, the founder of the Buddhist religion, is best known in India at the present day. His father was rajah of a small colony of Aryans, whose tribal name was Sakhya. See BUDDHISM.

Sak'i, or **Sak'e**, a kind of beer or fermented liquor prepared from rice grain, and constituting the national beverage of Japan, where it is largely consumed. The liquor is prepared by an elaborate series of steaming, fermenting, and mashing of rice, the product of a number of such operations being mixed in the mash tun and finally fermented in large vats. The fermented mash is strained and pressed through bags, and the liquor, when cleared by settling, is run off, heated, and filled into large butts for use. S. is drunk hot by the Japanese at their meals. In 1874 there were 6,501,083 hectolitres of S. made in Japan, with 127,446 hectolitres of inferior fermented liquor, 60,557 of distilled spirit, and 56,712 of sweetened spirit.

Sakkhar, a town of Scinde, district of Shikarpur, British India, on the right bank of the Indus, 330 miles N. of Kurrachi. Pop. (1872) 13,318. It has a large transit trade. In the neighbourhood are many tombs and mosques, and a leaning minaret of brick, 100 feet high, built in 1607.

Sal is the vernacular for *Shorea robusta* (*Dipterocarpaceæ*), a large tree, generally gregarious, occupying two extensive, but irregular, fairly defined belts in India separated by the Gangetic plain. The heart-wood is dark-brown, coarse-grained, hard, heavy, strong, and tough, with a remarkably fibrous and cross-grained structure. Its durability is considerable, but not equal to that of teak. For buildings, gun-carriages, river-boats, and railway sleepers it is the most important timber of N. India. The tree when tapped exudes large quantities of a whitish aromatic transparent resin or dammar, used to caulk boats and ships, and also for incense. Large forests have been destroyed by the process of tapping the trees.

Sal'a, **George Augustus Henry**, an English journalist of Italian parentage, was born in London in 1828. He early began to write for Dickens's *Household Words*, contributed the Hogarth papers to the *Cornhill Magazine*, was correspondent of the *Daily Telegraph* (1863-64) during part of the Civil War in the United States, and in the Franco-German War of 1870-71, founded and first edited *Temple Bar*, and still (1878) records the 'Echoes of the Week' in the *Illustrated London News*. Of his many humorous stories and sketches, all characterised by ceaseless vivacity, the best are, perhaps, *Twice Round the Clock* (1859), *Accepted Addresses* (1863), and *Adventures of Captain Dangerous* (1863).

Salaam, an Arabic word meaning 'peace, safety.' It is universally used throughout India as a form of salutation on meeting or parting—such as *salaam-ai-kum* = 'peace be with you.' Among Europeans the word has come to express specially the reverent homage which is paid in the East by an inferior to a superior.

Sal'ad is the general name for numerous vegetables eaten in a green state, either with or without the admixture of oil, vinegar, and other ingredients. The principal plants thus used are lettuce, endive, celery, succory, cucumber, radish, onion, sorrel, beetroot, among those of larger growth; and among the smaller, cress, mustard, and rape (used when in seed-leaf), lamb's lettuce, water-cress, chervil, purslane, &c. In France the variety of S. herbs in common use is much greater than in England, and the skill in preparation is more marked. It is necessary to bestow care in cleansing the herbs to avoid the introduction of entozoa into the body; and to secure a juicy and crisp consistence the plants must be 'morning gathered,' and not when drooping after a hot sun. S. herbs are beneficial not only

because they are comparatively rich in potash salts, but because they introduce large quantities of water into the system.

Sal'adin, as the Westerns have termed **Malek Al-Nasser Salah Ed-Din Abu-Mojafer Yusef**, was born in the castle of Tecrit, on the Tigris, in 1137. He was the son of Ayub, a Kurd in the service of Nouredin of Syria, and in the employment of that sovereign fought through three campaigns in Egypt, winning a great name by his skilful defence of Alexandria. On the death of his uncle, Shirkoḥ, he became grand-vizier to Nouredin; and when Nouredin died in 1174, S. seized Egypt. His first care was to secure his position by defeating Nouredin's youthful heir in several great battles; and in four years he had mastered southern Syria and a large portion of Mesopotamia. By the year 1185 his empire extended from Tripoli in Africa to the Tigris, and from Yemen on the Arabian Sea to Taurus. He now assumed the title of Sultan, and turned his arms against his only remaining foes, the Christians. Picking a quarrel with the freebooter Reginald de Chatillon, he inveigled the Latins into a pitched battle at Hittin (July 1187), and routed them entirely, killing 30,000 men. Guy de Lusignan, king of Jerusalem, though taken captive, was treated courteously, but Reginald was decapitated. Acre, Ascalon, and other important cities quickly gave way to the Sultan, and on October 2, 1187, Jerusalem surrendered after a siege of two weeks. The news inflamed Christendom; and the Third Crusade was undertaken. Richard Cœur de Lion, at the head of French and English, twice defeated S., captured Jaffa and Cæsarea, and in 1192 obtained a treaty of peace for three years, with protection and privileges to the Christians. Saladin died in the following year. He was a chivalrous warrior and a wise sovereign—undoubtedly the greatest Kurd that ever appeared in history. The Ayubite dynasty which he founded held sway in Syria till 1259 and in Egypt till 1250. See Gibbon, *Decline and Fall of the Roman Empire*; Marin, *Hist. de S.* (Par. 1763); Reinaud, *Notice sur la Vie de S.* (Par. 1874).

Salado', a tributary of the Purana, rises in a spur of the Andes, and after flowing 600 miles S.S.E. through the Argentine Republic, joins the main river below Santa Fé. It forms the southern limit of El Grand Chaco, and is in great part navigable for small vessels.

Salaman'ca, a town of Spain, capital of the province of S., situated between and on three small hills on the right bank of the Tormes, a feeder of the Douro, 83½ miles S.W. of Valladolid by rail. It is still surrounded by a wall which is pierced with 9 gates, and the river is crossed by a bridge of 27 arches built on Roman foundations. The streets are narrow and crooked, but contain many fine old houses which present an antique and imposing appearance. The town suffered much from the violence of the French, who on their retreat in 1812 left its western part almost entirely in ruins. The Plaza Mayor is the largest square in Spain, being capable of accommodating as a plaza de toros from 16,000 to 20,000 persons. The finest buildings are the two cathedrals, the older of the 12th c., and the later in the florid Gothic style, begun 1513, finished 1734; the Seminario, or former Jesuit college, in the Florentine style; the former Dominican monastery with 200 cells and a noble church; and the University, a fine Gothic quadrangle founded in 1200, and incorporated with the University of Palencia in 1243. It had in the 14th c. 14,000 students, and in the 16th c. 7000, though the attendance has now sunk to 600. It consisted of 21 smaller colleges (*colegios menores*), all of which are now ruined, and 4 superior colleges (*colegios mayores*) which still remain, viz., San Bartolomé, the oldest, hence known as El Colegio Viejo, modernised in 1767; Colegio de Cuenca, in the Cinque-cento style, now in great part ruined; the Colegio de Santiago, or El Colegio del Arzobispo, in the Cinque-cento style, begun 1521; and the Colegio del Rey, commenced in 1625. The University library has 250,000 vols. and 1500 MSS. S. has manufactures of cloth, hats, leather, and earthenware. Pop. (1877) 16,292. S. was a municipium under the Romans, by whom it was called *Salmantica*. Near it the French under Marmont suffered a disastrous defeat from the British under Wellington, July 22, 1812.

Salaman'der, in the superstition of the Middle Ages, an animal whose element is fire. Theophrastus Paracelsus (q.v.) includes the S. or 'Vulcan' among the 'Sagana,' or 'Elementary spirits.' Randle Holme, in his *Academy of Armory and Blazon*, describes it as 'a creature with four short feet like the lizard, without ears,

with a pale white belly, one part of the skin exceeding black, the other yellowish-green, both very splendid and glittering, with a black line running all down the back. The skin is rough and bald; they are said to be so cold that they can go through the fire, nay, abide in it, and extinguish it, rather than burn.' Benvenuto Cellini (q. v.) says in his Autobiography that when he was about five years of age his father one day showed him a S. in the fire. In the diverting work *Le Comte de Gabalis*, by the Abbé Montfaucon de Villars, from which Pope derived the hint of his 'machinery' for the *Rape of the Lock*, it is said that the S. is 'composed of the most subtle parts of the sphere of fire, conglobated and organised by the influence of the universal fire, so called because it is the principle of all the motions of Nature. . . . If we would recover our empire over the salamanders'—lost at the fall of Adam—'we must purify and exalt the element of fire that is in us. For this there is no more to be done but to concentrate the fire of the world by concave mirrors in a bowl of glass; and this is the operation which all the ancients have religiously concealed, till divine Theophrastus revealed it.'

Salaman'der, the name given to certain newts or Amphibian *Urodela*, credited in classic ages with venomous powers, and still regarded with suspicion by the ignorant. Pliny placed a S. in the fire and found it to be consumed, but the popular idea of the S.'s powers of resisting incineration survived for many centuries after. Salamanders form a distinct family (*Salamandridæ*). None of the members occur in Britain, but one species, the spotted S. (*S. maculosa*), about 6 or 7 inches in length, is found in S. Europe, and a well-known species the Alpine S. (*S. Alpina*) inhabits dry places in the Alpine range. The tail is cylindrical, and the skin warty; the glands secrete a watery fluid, the rapid excretion of which may have inspired the belief of the S.'s powers of quenching fire. The palatine teeth are arranged in a double series. The head is broad and the tongue well developed. The S. closely resembles the lizard, from which, however, it is to be carefully distinguished. It brings forth its young alive (*ovo-viviparously*), and the young are provided, as in all *Amphibia* (q. v.), with gills, which are afterwards cast off when lungs are developed. The young of the Alpine S. shed their gills before birth, a curious adaptation to the want of water in their native districts.

Sal'amis (mod. *Kuluri*), an island of Greece in the Gulf of Aegina, near Athens, 10 miles long by 10 broad. It originally formed an independent state, and contributed its quota to the Greek fleet in the Trojan war. Subsequently it was conquered by Sparta, Athens, and Macedonia. Off S. was fought the famous naval battle between the Persians and Greeks, 480 B.C., in which the former were completely defeated.

Sal Ammo'niac. See HYDROCHLORATE OF AMMONIA.

Sal Volatile. See AMMONIA.

Salang' or **Thalang'** (called by Europeans Junk-seylon), an island on the W. coast of the Malay peninsula, within the kingdom of Siam. Formerly a place of considerable trade, and the seat of a French Christian mission as early as 1670, it was conquered and desolated by the Burmese in 1809. Within the last five years it has become an important centre of tin-mining industry. The pop. is estimated at 32,500, of whom 27,000 are Chinese miners. The exports of tin are about 100,000 *pikuls* (one *pikul*=133 lbs.). The title of the Siamese governor is *Phya Puket*. The chief town is Puket or Tongkah, with a harbour at which more than twenty steamers call every month.

Salur Jung Behaudur, Sir, G.C.S.I., the prime minister of the native State of Hyderabad, or the Nizam's dominions, in India. His personal name is Mir Turab Ali; and among his titles are Salar Jang, Mukhtar-ul-Mulk=leader in battle, governor of the country. He has been since 1853 Diwan or Vizier, in which capacity he presides over the administration of the country in all its branches, without much opposition from any quarter; and since 1869 he has been one of the two co-regents for the infant Nizam. His loyalty to the British was conspicuous during the Mutiny of 1857; and in 1876 he paid a visit to England as the guest of the Duke of Sutherland. His position may be said to be tending to become hereditary, and two of his nephews now superintend the Departments of Revenue and Public Works.

Saldan'ha, Oliveira e Daun, João Carlos, Duke of, a Portuguese statesman, grandson of the Marquis de Pombal, was

born at Lisbon, November 17, 1791. He was educated at the College of Nobles in Lisbon and the University of Coimbra, and after filling several minor posts was appointed minister for foreign affairs by João VI. in 1825. Next year he became minister of war, but resigned in 1827. He led the insurgents at Oporto in the war against Dom Miguel, and on his defeat retired to England. Returning to Portugal with Dom Pedro in 1832, he became his generalissimo, and took Oporto in 1833 and Lisbon in 1834, receiving the capitulation of Dom Miguel at Evora in the same year. He now joined the opposition, and took part in the conservative attempt at a revolution in 1836, after which he was again obliged to retire to England. Recalled in 1836, he became chief minister; was displaced in 1849, but recovered his power in 1851, and maintained it after the accession of Pedro V. (1853) till 1856, when he again became leader of the opposition. Recovering from the severe illness which led to a false report of his death (1861), he acted as ambassador at Rome, 1862-64 and 1866-69, and at Paris 1869. On the 19th May 1870 he marched up with a considerable force to the Ayuda Palace at Lisbon, and obliged the king to dismiss his minister, the Marquis de Loulé, and appoint himself in his place. His administration lasted until September 13, 1871. In the following month he went as ambassador to London, where he died November 21, 1876. His body was conveyed in a Portuguese vessel of war to Lisbon, where he was buried with great pomp in the Royal Pantheon of San Vicente.

Saldan'ha Bay is on the W. coast of Cape Colony, 80 miles N. of Cape Town. It is a magnificent natural harbour, being easy of entrance, deep, roomy, and sheltered, but its shores, owing to the total absence of fresh water, are desert and uninhabited. The bringing of a supply of water from the Berg river has been long projected, but, though easy of accomplishment, the work has never been commenced, and the finest harbour in S. Africa remains unutilised in consequence.

Sale. In English law, an article sold becomes the property of the purchaser, on completion of the contract of S. In Scotch law, the right of property remains in the vendor until the subject of contract has been delivered to the vendee. The distinction is important, in case of bankruptcy. See REPUTE OWNER SHIP, MARKET OVERT, GOODS, PURCHASE AND SALE OF.

S. or Return.—When goods are sold upon S. or return, no right of property rests in the conditional vendee, and the S. of them by him, contrary to terms agreed on, renders him liable to pay damage. Yet, in the event of the consignee's insolvency, goods so consigned would fall to his creditors.

S. of Horses.—A purchaser acquires no property in a horse which has been stolen by the vendor, according to the general rule of law that no one can give another a better title than he himself possesses. If the S., however, be in open market, in which the horse has been kept for at least one hour, the purchaser acquires a good title. A warranty of soundness does not imply a guarantee against injury, easily and wholly curable. A contract of exchange is the same as a contract of S.; but delivery, on one side at least, is essential as proof of the agreement.

S. of Real Estate.—The law, as a general rule, affords no redress for oversights in the purchase of estates, when these might have been avoided by ordinary judgment and vigilance. But if the vendor knowingly conceal *latent* defects, either regarding the estate or its title, he cannot compel execution of the contract (see FRAUD). From the moment of S., the vendee becomes owner of the property; and, consequently, from that time entitled to any profit and subject to any loss which may accrue from it. In trust estates, the purchaser is bound to see to the application of the purchase-money, according to the terms of the trust, unless released from that obligation by its terms. Persons holding an official position, adverse in case of S. to those interested in the subject, are generally legally disqualified from purchasing it. Contracts of S. must be in writing, with terms of agreement fully stated. 8 & 9 Vict. c. 119 regulates the conveyance of real property in England, and abbreviates the form.

Sale, George, the well-known Orientalist, was born in Kent between 1680 and 1700, was educated at King's College, Canterbury, and became a lawyer. He aided in the publication of the *Universal History*, and wrote the introductory portions in a reverential though somewhat rationalistic spirit. He also wrote

for the *General Dictionary*, and assisted in starting several learned societies in London. His fame rests chiefly on his translation of the *Koran* (1734), with dissertation and notes. The latest reprint of this invaluable work—by far the best translation of the *Koran*—is by F. Warne & Co., in the *Chandos Classics* (1877). S. approached the study of the anti-Christian religions in a more liberal and appreciative spirit than was prevalent in his day, and with a singularly wide knowledge of Oriental literature, history, &c. He died 14th November 1736. His valuable collection of Oriental MSS. was purchased for the Radcliffe Library, Oxford.

Sale, Sir Robert Henry, a distinguished British general, was born in 1792, and entered the army at the age of thirteen. He led the storming party against the stockades at Kemendeen, near Rangoon, in the first Burmese war of 1825, and also was conspicuous at the storming of Ghuzni, in the Afghan war of 1839. When the British force was destroyed at Cabul, he fortified himself at Jellalabad, where 'the illustrious garrison' held out from 12th November 1841 to 7th April 1842, when relieved by General Pollock. S. was killed at the battle of Mirdki (q. v.), 18th December 1845. See Greig, *S.'s Brigade in Afghanistan*.

Salem, the chief town of the district of the same name, in the Madras Presidency, British India, on the right bank of the Tyromany River, 207 miles S.W. of Madras by rail, and 70 N.W. of Trichinopoly. It is an improving town, with many brick houses; and there are manufactures of cotton and silk cloth. Pop. (1871) 50,012.—The district of S. consists mostly of a tableland among the E. Ghats. Area 7483 sq. miles; pop. (1871) 1,966,995. It is bounded S. by the Cauvery River, and traversed by the Palar and Pennar. It contains the Shevaroy Hills, which have an excellent climate. The products are rice, maize, *ragae*, cotton, tobacco, and coffee. Iron ore is worked, and saltpetre is collected. The district suffered severely in the famine of 1877.

Salem, a town and seaport of Massachusetts, U.S., 14 miles N.W. of Boston by rail. It was formerly a leading commercial town, and carried on a large trade with China and the E. Indies. Its trade now consists chiefly in the exportation of coal, and in the manufacture of leather, cotton, and jute. The chief institutions are the Essex Institute and the Peabody Academy of Science, which have each good libraries. There are seven papers, two semi-weekly and three weekly. Pop. (1870) 24,117; (1876) 26,430. S. was the scene of the famous witchcraft delusion of 1692, and here in 1774 the state of Massachusetts first resolved itself into a sovereign political power.

Salem, the capital of the State of Oregon, U.S., on the Willamette River, 50 miles S. of Portland by rail. It has eight churches and four newspapers, and is the seat of a university. Near it are situated the State penitentiary, and the State institutions for the deaf, dumb, and blind. The falls of Mill Creek afford good water-power, but the manufactures are as yet small. Pop. (1870) 1139; estimated in 1875 at 6000.

Sale'mi (Arab. 'place of delight'), a town of Sicily, province of Trapani, 48½ miles S.W. of Palermo, with a considerable trade in wine and oil. It is commanded by a ruined castle of Arabo-Byzantine architecture. Pop. (1874) 14,096.

Sal'ep (Mod. Gr. *salepi*, Pers. *sahaleb*) is a nutritious substance, consisting chiefly of bassorin, some soluble gum, and a little starch, obtained from various species of *Orchidaceae*, and forms, when prepared with water or milk, a demulcent and emollient drink. The ordinary S. of commerce consists of the tubers of the wild *Orchis mascula* and several allied species, dipped in boiling water for a few minutes, and quickly dried. For dietary purposes the dried tubers are reduced to powder. The bulk of that imported to Western countries comes from Smyrna. The tubercular roots of several species of *Eulophia* furnish the S. of Cashmere and of the Neilgherries.

Salerno (anc. *Salernum*), a town on the W. coast of Italy, in the province of S., 34 miles S. of Naples by rail. It is the seat of an archbishop, and has 18 churches, 19 monasteries, a lyceum, and a fine Marina or quay, a mile long, at the end of which is a large theatre. The Gothic cathedral of San Matteo, founded in 1084, though 'restored' in 1768, is still very interesting, and has valuable pillars, sarcophagi, &c., and the tombs of St. Matthew, Margaret of Anjou, Gregory VII., &c. S. has a monument to Carlo Pisacano, the 'precursor of Garibaldi.'

The neighbouring country is rich in oranges, palms, vines, &c. There are a number of paper-mills, and some silk and cotton looms. Pop. (1877) 29,969. S. first rose into importance during the Middle Ages. It was held in the 9th and 10th centuries, first by the Saracens and then by the Lombards, and in the 11th c. by the Normans. Robert Guiscard, the Norman, founded the castle whose ruins now overlook the town, the cathedral, and the medical school, the latter of which continued to flourish after the houses of Hohenstaufen and Anjou became masters of the place, and was for a long time the most famous in Europe.—**Gulf of S.**, anciently the *Sinus Pesticus*, measures 36 miles between Points Campanella and Della Licosa. The only towns now on it are Amalfi and S.

Sales, St. Francis of. See FRANCIS, ST., OF SALES.

Salford, a municipal and parliamentary borough of Lancashire, nominally separated by the Irwell from Manchester, of which city it virtually forms part, although possessed of separate jurisdiction. Apart from Manchester it returns two members to Parliament, and has a pop., according to the Registrar-General's estimate for 1877, of 162,978. Its town-hall was enlarged in 1874, and it has three public parks, of 16, 15, and 13 acres respectively, opened 1876-77. The Free Museum and Library, visited since their foundation in 1849 by 14,000,000 persons, have been enlarged by the addition of a N. wing (1852), a S. wing (1857), a portico (1864), and the Longworthy Gallery (1878), their total money value, exclusive of the last, being set down at £42,000. See MANCHESTER.

Salian Priests (Lat. *salii*, 'the leapers' or 'dancers'), a college of twelve priests, instituted by Numa (q. v.), at the close of whose reign an *ancile* or shield fell from heaven and ward off a pestilence. Lest this shield should be stolen, Numa had other eleven made exactly the same, and appointed the S. P. to keep them. They were priests of Mars Gradivus, and celebrated his festival annually on 1st March, with great dancing and singing, after which they partook of a sumptuous feast in the temple of Mars on the Palatine. Tullus Hostilius is credited with the foundation of another college of twelve *Salii*, but this less famous body was probably distinguished from the other chiefly by being chosen from a different tribe. The S. were always patricians.

Salicine (C₁₃H₁₈O₇) is a bitter substance extracted from willow bark by boiling it in water. It is sparingly soluble in cold water and insoluble in ether, but dissolves readily in boiling water and in alcohol. It is the chief member of the class of substances known as *Glicosides* (q. v.).

Medicinal Properties of S.—S. has been employed in medicine for several years as a simple bitter, but is now used chiefly in acute rheumatism, its therapeutic action being manifested in lowering the temperature and diminishing the length of the disease. In such cases S. should be given in 15 gr. doses every two hours. *Salicylic acid* is a powerful disinfectant and antiseptic. It is three times more powerful than carbolic acid in preventing fermentation. Its antiseptic properties seem to be confined to the acid itself.

Salic Law was an ancient law of the Salian Franks (see FRANCE), by which males only could inherit certain lands. The principle of excluding female succession came to be extended to the crown of France, and has been invariable in the history of that nation.

Salient, in geometry, is the name given to any angle less than two right angles. Hence in any polygon the salient angles project outwards, the re-entrant angles inward. In the same sense, the term is applied in fortification to the projecting angles of a fortress.

Salient (Lat. 'leaping'), in heraldry, is applied to animals to signify that they are in the act of leaping or springing. Thus a lion S. is erect upon his hind-legs, with his tail and both fore-paws raised.

Saliferous System, a disused term for the Triassic formation (q. v.), which originated in the fact that that system yields all the British deposits of salt.

Salifiable Base, a term sometimes used in chemistry to denote those substances which, like metallic oxides, combine in definite proportions with acids to form salts.

Salina, one of the Lipari Islands (q. v.).

Saline Plants. Among the influences affecting the distribution of plants, with the exception of climate, heat, and moisture, none is more potent than the sea. Excluding Algæ or sea-weeds, and a number of phanerogamic sea-grasses which are subaqueous along the coasts, belonging to the genera *Halophila*, *Zostera*, *Cymodocea*, *Thalassia*, &c., and numbering twenty-six species, we find a large group of plants of diverse natural orders that flourish *only* when subjected to the influence of a soil impregnated with, and an atmosphere laden with, saline particles. Others, again, that seem to relish these conditions, have a constitution enabling them to thrive also when situated in inland localities. Both are ordinarily spoken of as *S. P.* Of the first, the samphire, the saltworts, the sea-blites, the sea-holly, and the sea-convulvulus are familiar examples; and of the second may be mentioned the scurvy-grass, the thrift, the sea-campain, the sea-plantain, the tamarisk, the rosemary, the beet, the celery, the sea-kale, and many others. As a rule, seaside plants have succulent stems with thick, fleshy leaves, whilst those inhabiting the saline plains of Asia and S. America are often hard and spiny. Reckoning the British flora at 1670 species of flowering plants and ferns, about 70 of these may be classed as saline plants, and a large proportion bear the specific name *maritima* or *marina*.

Saline Powder, Compound, may be prepared by drying to a gentle heat and then pulverising 4 oz. of pure chloride of sodium, or common salt; 4 oz. of sulphate of magnesia, or Epsom salts; 3 oz. of sulphate of potash; and 4 oz. of the sulphate of soda. The salts should then be mixed and triturated together, and kept in an air-tight bottle. Dose, 2 or 3 drachms, dissolved in half a pint of water. Effervescent saline powder may be prepared thus:—Take half an ounce of carbonate of magnesia, and an ounce of each of the following substances—viz., sulphate of magnesia, bicarbonate of soda, tartrate of soda and potash, and tartaric acid. Expel by heat the water of crystallisation, and mix. Dose, one or two tea-spoonfuls in water, with a drop of oil of lemon and a little powdered sugar to each dose.

Salins, a town in the department of Jura, France, with important salt-springs in its neighbourhood, whence much salt is produced. S. has also gypsum mines. Pop. (1876) 5577.

Salisbury (pron. *Saulsbury*), or **New Sarum**, the county town of Wilts, England, 82 miles W.S.W. of London by rail, was formed in 1215 by the emigration of the bishop and villagers from the neighbouring hill of Old Sarum, where a cathedral and castle had long stood. A new cathedral was founded at S. and completed in 1258; at the same time S. was made a free city by Henry III. Since then the name of S. has often appeared in the annals of English history. The cathedral is one of the finest specimens of the Early or Pointed Gothic. It is built in the form of a double cross, is 469 feet long, and measures 203 feet across the great transept. At the intersection of the nave and great transept rises the spire, 404 feet in height, being the highest in England. The cathedral contains some interesting tombs and monuments. In 1789 Mr. Wyatt was employed to make many alterations within and without the church, and in so doing removed unfortunately much that was beautiful and curious. The work of restoration, however, has been going on since 1863 under the direction of the late Sir G. G. Scott, and £55,000 has been expended. The choir was reopened in 1876, and the nave is now in the hands of the restorers. The reredos, which had been removed, has been replaced by the munificence of Earl Beauchamp, and an open metal screen erected between the choir and nave. S. has several other churches and chapels, a theatre, three bridges, a number of hospitals and almshouses, and several schools in connection with the ecclesiastical foundation. Five newspapers are published here. S. is a municipal and parliamentary borough returning two members to Parliament. Pop. (1871) 13,839.—**S. Plain**, a once extensive unenclosed plain around the town of S., extending E. and W. from Hants to Dorsetshire. The uncultivated portion is now much diminished in size. The so-called 'Druidical' circle of Stonehenge (q. v.) is in Salisbury Plain, about 6 miles N. of the city.

Salisbury, Robert Arthur Talbot Gascoigne Cecil, Marquis of, K.G., eldest surviving son of the second Marquis, comes of the family founded by William Cecil (q. v.),

Lord Burleigh, whose son Robert became Earl of Salisbury in 1605, the marquise being added in 1789. S. was born at Hatfield, 13th February 1830, was educated at Eton and Oxford, and entered the House of Commons as member for Stamford in the Conservative interest in 1853. He sat until 1868, at first under the title of Lord Robert Cecil, and after the death of his elder brother as Viscount Cranbourne. In July 1866 he became Secretary of State for India under Lord Derby, but resigned on March 2, 1867, owing to a difference of opinion with regard to the Reform Bill. In 1868 he succeeded to the marquise on the death of his father, and in 1869 he was elected Chancellor of the University of Oxford. He became Secretary of State for India when Mr. Disraeli took office in 1874, and represented England in the Conference of Constantinople in December and January 1876-77. On the retirement of Lord Derby from the cabinet on March 28, 1878, he became Secretary of State for Foreign Affairs, and signalled his accession to office by a circular on the Eastern Question, which convinced Europe that England intended to re-assert its influence as a great European power. Along with Lords Beaconsfield and Odo Russell he represented England in the Berlin Congress of June and July 1878. On his return he was invested by Her Majesty with the Order of the Garter. As a parliamentary speaker, Lord Salisbury is distinguished for the force and weight of his utterances, as well as for the cutting satire he has always at command—'a master of jibes,' as Lord Beaconsfield once described him with malevolent accuracy. Though utterly different in temperament and character from the leader of his party, S. approves of his 'imperialist' policy, and is profoundly convinced that England cannot with dignity or safety become merely a 'nation of shopkeepers.'

Saliva and Salivary Glands. S. is popularly known as the 'spittle,' a fluid of the mouth; and the S. G. are the structures devoted to the secretion of this fluid from the blood. There are three pairs of S. G. in man. The first form the *parotid glands*, placed in front of and somewhat below the ears. These are the largest, and vary in weight from $\frac{1}{2}$ oz. to 1 oz. each. The *submaxillary glands* are the second pair, and lie below the jaw, in the anterior triangle of the neck. Each weighs about 2 drachms. The *sublingual glands* are the smallest; they lie in the floor of the mouth, and close to the front of the lower jaw on each side. The parotid glands each open into the mouth by a duct (*Steno's duct*) which enters by an orifice placed opposite the second molar tooth of the upper jaw. *Wharton's duct*, leading from each submaxillary gland, opens at the side of the *frænum*, or ligament of the tongue; whilst the ducts of the sublingual gland are known as the *ductus Riviniani*, and number from eight to twenty. They open separately near the termination of Wharton's duct. The parotid gland derives its bloodvessels from the external carotid artery; the sublingual from the artery of that name; and the submaxillary gland from the facial and lingual arteries. The *nerves* of the S. G. are derived from the various flexures. In structure, the S. G. are *racemose glands*. Each is composed of lobes, made up of lobules, of closed sacs or vesicles.

S. itself is a clear fluid, which in the mouth becomes mixed with *mucus* and with the *epithelial* debris of the mouth. When secreted the S. appears at first to be alkaline in its nature, and when digestion is proceeding, the alkalinity of the S. is still strongly marked. During fasting the S. is said to exhibit a neutral reaction, the alkalinity being neutralised by the acid mucus of the mouth. In 1000 parts of S., Frerichs found 99·10 parts of *water*, and 5·90 of *solids*. The solids were distributed as follows:—*Ptyalin*, 1·41; *fat*, 0·07; *epithelium* and *mucus*, 2·13; *salts* (sulphur-cyanide of potass; sodium, calcium, and magnesium phosphates; sodium chloride and potassium chloride), 2·29. The *ptyalin* is the important component of S., since by aid of this substance the *starch* of food is converted into readily digested *dextrin* and *grape-sugar*. The other uses of S. are to render deglutition easy and to assist in articulation. *Ptyalin* is thus seen to be a sugar-forming ferment. The *quantity* of S. secreted daily varies from 1 to 2 lbs. The S. of children is not capable of transforming starch into sugar until they have attained the age of six months, hence starchy foods should not be given to children before that period.

Diseases of the S. G.—The most common of these are *Ranula* (q. v.), *parotitis* (see MUMPS), and *salivary calculus*. *Salivary fistula* is one of the most disagreeable complications of wounds

of the face; but it may also be caused by an abscess which lays open Steno's duct. The saliva is constantly running out on the cheek; and, if the division be complete, the patient may be conscious of dryness of that side of the mouth. The disease is to be treated by restoring the passage for the saliva from the gland into the mouth, an operation sometimes attended with considerable difficulty. There are also certain functional disorders of the salivary glands, the most important of which is Salivation (q. v.).

Salivation or Ptyalism (Gr. *ptyalon*, 'saliva') is the term employed to denote an abnormally abundant flow of saliva. It may be idiopathic or spontaneous, occurring without any apparent cause, or it may arise from a specific form of inflammation of the parotid glands induced by the action of such medicines as mercury and iodide of potassium. Idiopathic S., not associated with any disease whatever, sometimes occurs. S. is also very common in the confluent form of smallpox, in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy. The most common form of S., requiring medical treatment, is that induced by the action of mercury. When mercury has been administered so as to produce constitutional effects, the first symptoms of its action are to be looked for in the mouth. There is a slight foetor of the breath, some soreness of the teeth when touched, and a disagreeable metallic taste in the mouth. If the use of the mercury be persisted in, the gums become soft, spongy, and swollen, bleeding on very slight abrasion, and there is a marked increase in the secretion of saliva. In the more severe forms of S., emaciation goes on rapidly, and in some cases ulcers occur on the extremities; the blood becomes more fluid and watery than normal, and it contains a large quantity of foetid fatty material. To check this excessive S., chlorate of potash, in 20-grain doses three times daily, may be given. Gargles of the chlorate may also be used, and moistened tannin may be applied to the gums. Opium is also sometimes given, and belladonna is said to arrest the secretion of the salivary glands by paralysing the extreme branches of the chorda tympani.

Salix. See WILLOW.

Sal'ee, or Sla, an Atlantic port of Morocco, at the mouth of the river Bu-Regreb, on the N. bank, the town of Rabat being built on the S. bank opposite. A bar renders the entrance to the port frequently unsafe. S. was formerly notorious as the headquarters of Moorish piracy, whence issued the dreaded 'Sallee rovers,' and so recently as 1851 both S. and Rabat were severely bombarded by the French for piratical conduct. S. has manufactures of carpets for home use; and exports wool, beans, and maize. Pop. about 12,000.

Sallow (from Old Eng. *sāl* and *sād*, a 'tie' or 'band,' indicating a shrub fit for *withes*) is the English common name for a group of willows ranging under, or in close alliance with, *Salix Caprea*—the common S. or goat-willow. The shoots are not flexible like the osier group, but those of two years' growth are sometimes split and used for barrel hoops. *S. Caprea* is the earliest-flowering British willow, and the twigs with male catkins, gathered at Easter, are called palm-branches. The flowers at this early period of the year are eagerly sought by bees. It is often only a big bush, but in suitable situations becomes a tree, when the wood is useful for implement handles, &c., and for charcoal. The bark serves for tanning, particularly glove-leather. See OSIER and WILLOW.

Sallow-thorn, so called from its white willow-like leaves and spinous branches, is known botanically as *Hippophae*, a genus of the small natural order *Elaeagnaceæ*. *H. rhamnoides* (called also 'sea-buckthorn') is an ornamental shrub or small tree common in many places on the Atlantic, German Ocean, Mediterranean, and Baltic seaboard of Europe; is met with abundantly in the valleys of the Alps, Apennines, &c.; and extends across Asia to the Himalaya. In Britain it is indigenous on the S. coast, and is naturalised in Scotland, where it has been planted in numerous localities along the coast as far N. as Islay and Fife as a screen for inland vegetation, and for binding the light sandy soil. The orange-yellow fruit is very acid, but boiled with sugar it forms a palatable and wholesome preserve.

Salustius, Caius Crispus, known to English readers as **Salust**, was born B.C. 86 at Amiternum, in the country of the Sabines. He was of plebeian origin; but that did not bar his promotion. At an early age he obtained the quaestorship, and in

B.C. 52 was elected tribune of the people. In B.C. 50 he was expelled from the senate at the instance of Appius Claudius Pulcher and L. Calpurnius Piso on the ground of his adultery with Fausta, daughter of Sulla and wife of T. Annius Milo. S. for his offence got a sound whipping from the irate husband, and was only allowed to go on paying him a sum of money (see A. Gellius, xvii. 18). There were probably other reasons for his ejection from the senate. In fact, the story has an apocryphal look, inasmuch as S. was elected tribune after the date assigned to the affair. Be that as it may, we hear no more of him for some years. On the outbreak of the Civil War he espoused the cause of Caesar, and in 47 B.C. was praetor-elect, and was thus once more in his former rank. He nearly lost his life in a mutiny in Campania while conducting some of Caesar's forces that were under orders to sail for Africa. We next find him in Caesar's suite in the African campaign of B.C. 46. He was appointed by his chief to the proconsulship of Numidia, where he is said to have oppressed and pillaged the people. The fact of his acquiring the immense wealth which enabled him to lay out and adorn those splendid gardens on the Quirinal (*horti Sallustiani*), which still retain his name, lends colour to the charge. On his return to Rome he was accused of maladministration, but there is no evidence to show that he was ever brought to trial. S. now settled down on his princely estate, and devoted himself assiduously to literature. After passing quietly through the troublous times that followed Caesar's death in the enjoyment of rich opportunities and lettered ease, he died 34 B.C. Only two of the works of S. have come down to us entire—1st, the *Catiline*, or *Bellum Catilinarium*, a history of the conspiracy of Catiline in the consulship of Cicero 63 B.C.; 2d, the *Jugurtha*, or *Bellum Jugurthinum*, which contains an account of the war between the Romans and Jugurtha, King of Numidia, B.C. 111-106. Of his work entitled *Historiarum Libri Quinque*, supposed to have been a record of the events that occurred 78-66 B.C., only a few fragments remain. The *Dua Epistola de Republica Ordinanda* and the *Declamatio in Ciceronem* are of doubtful authenticity.

In point of elegance, vigour, and concentrated energy S. as a writer has few equals; but his excessive love of brevity and his constant affectation of archaic words and forms ever and anon reveal the art which the finger of genius alone knows to conceal. He is an artist more occupied with his style and colouring than with the subject in hand. Moreover, considering the licentious character of his life, one can hardly help imputing a certain amount of disingenuousness to his philosophical introductions. Yet his reputation at Rome was of the highest. Martial (Epigr. xiv. 191-2) speaks of him as 'Crispus Romana primus in historia,' while Tacitus (Ann. iii. 30) calls him 'Rerum Romanarum florentissimus auctor.' S. was more of a party politician than a statesman, and his intense hatred of the nobility rather than his love for the people accounts for his narrow liberalism. The story of his marrying Terentia, the divorced wife of Cicero, is highly improbable (see Drumann, *Geschichte Rom.* vol. vi. p. 693). The *editio princeps* of S. was published 1470, fol., whether at Venice or Rome is uncertain. The best editions are those of Curtius (Leips. 1724), F. D. Geilach (Basel, 1823-31, 3 vols. 4to), Kritz (Leips. 1828-34, 2 vols. 8vo), F. D. Geilach (Leips. Tauchnitz, 1856), R. Dietsch (Biblioth. Teubner, 5th ed. 1867), and H. Jordan, with short critical notes (Berl. 1866). English translations are numerous.

Sall'y-Port, in fortification, a passage made in the glacis, leading from the terreplein of the covered-way to the exterior. In naval affairs the term S.-P. denotes either a landing-place for war-ships' boats, or the opening provided in a fire-ship for the escape of her crew.

Salma'sius, Claudius (Claude de Saumaise), was born near Sémur-en-Auxois, in Burgundy, April 15, 1588. At the age of ten he wrote Greek and Latin, and read Pindar with ease. At Paris and Heidelberg he showed himself an indefatigable student, and became renowned as a prodigy of learning. The Venetians, the Pope, and the University of Oxford vied in endeavouring to secure him, but in 1632 he accepted a professorship at Leyden. Upon the execution of Charles I., Charles II., then in Holland, employed S. in defending the monarchy, and the result was the famous *Defensio Regia pro Carolo Primo* (Leyden, 1649). The abuse so freely used in this book was simply coarse; Milton's reply to it—*Defensio pro Populo Anglicano*—contains plenty of

rude invective, but also masterly and piercing sarcasm. S. died at Spa, September 6, 1653, some have said from chagrin at loss of credit. The most important of his other works is *Pliniana Exercitationes in Cuius Julii Solini Polyhistora* (2 vols. folio, Par. 1629). A collection of his letters was published in 1656. See Arkenholz's *Memoirs of Queen Christina*, and Prof. Masson's *Life of Milton* (vol. iv. 1877).

Salmon (*Salmo salar*), a *Teleostean* fish, the type of the family *Salmonide* (q. v.), known by the blue-black lustre of its back, and the silvery colour of its under parts. It is the finest of food-fishes, and that which has been the subject of the most important legislation. Its natural history is full of interest. Briefly detailed, it may be divided into the following stages of (1) *egg-deposition*, (2) *hatching*, (3) *parr*, (4) *smolt*, (5) *grilse*, and (6) *S.* The *S.* breeds towards the end of autumn or beginning of winter, and ascends rivers for this purpose. The female fish excavates furrows in the gravelly bed of the river and therein deposits her eggs, which are duly fertilised by the male fish shedding the milt upon them. The eggs are covered with gravel by the action of the tail and fins. It is calculated that the female contains about 900 eggs for every lb. of her weight. The eggs are subject to the attack of many enemies amongst fishes and birds; and good authorities agree in stating that out of every 1000 eggs deposited hardly one fish reaches the market. In artificial *S.*-hatching practised at Stormontfield, Hünningen (q. v.), &c., about 1000 fishes in the form of smolts are obtained from every 3000 eggs. The *S.* eggs are hatched in from 90 to 130 days, and the temperature must not rise above 70°. From the eggs come forth the *parr*, and in this stage the young *S.* remain, some for 13 or 15 months, others for two years and over. It is a remarkable fact that of each brood of *S.*-*parr* some members become *smolts*, i. e., attain the second stage of growth, at a much earlier period than others. Observations made at the Stormontfield pond lead to the belief that one-half become smolts at the end of the first year, and the other half at the end of the second. Mr. Buckland maintains that the smolts swim seawards in May and June, some in the first year, others in the second, and others in the third year. Mr. Dunbar's experiments show that about 8 per cent. of the artificially-hatched *parr* become smolts at the end of the first year, 60 per cent. at the end of the second, and 32 per cent. at the end of the third. On becoming a *smolt* the *parr* acquires a silver armour. As the smolt it seeks the sea, the *parr* perishing in salt water. After the smolts pass to the sea they grow with wonderful rapidity. They may return to their rivers, after a six weeks' sojourn in the sea, as *grilse* of from 5 to 8 or 9 lbs. weight. The *grilse* on returning to the rivers they left as smolts spawn for the first time. Again returning to the sea, the *grilse* increase in size, and thus gradually become *S.* They increase materially in size during their seaward migrations. Three *S.* captured on their way to the sea in 1859 by the Duke of Athol, were duly marked, and were found to weigh 10 lbs., 11½ lbs., and 12½ lbs. Six months afterwards they were again caught, and were found to weigh 17, 18, and 19 lbs. respectively. It is probable that *S.* as a rule return from the sea to their native rivers, but at the same time there is no adequate reason for the belief that they may not enter other rivers. The rule that *S.* attain the largest size in the largest rivers, is supported by evidence of trustworthy kind, but large *S.* may sometimes be obtained in small rivers. The *N. Esk* near Montrose, the *Stinchar* in Ayrshire, and the *Roy*, which runs into the *Spean*, are instances of small rivers in which large *S.* are obtained. Mr. Yarrel mentions a *S.* of 83 lbs. weight as having been received by Mr. Forbes of Bond Street, London, and Mr. Buckland's list of large *S.* mentions a *Tay S.* of 4 feet 3 inches in length, and weighing 70 lbs.; a *Rhine S.* 4 feet 8 inches, and 69 lbs.; a *Shannon S.* 54 lbs.; a *Tay S.* 4 feet and 53 lbs.; a *Rhine S.* 4 feet 3 inches and 51½ lbs.; a *Tay S.* 4 feet 3 inches and 51 lbs.; a *Wye S.* 4 feet 2 inches and 50 lbs.; a *Shannon S.* 4 feet 3 inches and 46 lbs.; a *Wye S.* 3 feet 10½ inches and 44½ lbs.; and a *Tay S.* 3 feet 8 inches and 42 lbs. Some interesting details have been given as to the largest *S.* caught by the rod. A *Tweed S.* so caught weighed 69½ lbs.; and in 1812 one of 67 lbs. was caught in the *Nith*. A *S.* of 61 lbs. weight was captured in the *Tay* in 1870; and one of 53 lbs. in the *Tweed* in 1876.

Recent reports of the inspectors of the English *S.* fisheries show that the annual value of the *S.* fisheries of England and Wales

480

amounts to at least £100,000. When the inspectors were originally appointed, their estimate of the annual value was £30,000. It is curious to note that the *Tyne* is the most productive *S.*-river in England, notwithstanding its pollutions. The statistics of the *Tyne* give 129,100 fish for 1872. In 1874 the 'take' amounted to only 21,746 fish, being a decrease of 107,354; but this decrease is attributed to the use of 'hang nets' placed at the estuary of the river. Each net is 140 yards long, and a series of nets may extend for a mile or more. Such nets prevent the ascent of the *S.*; but recent legislation may restore the *Tyne* to its former productive condition. In 1875 the *Tyne* gave a return of 23,290 *S.* The *Uk* is regarded as the best rod-river in England, 3000 *S.* having been captured in it by the net and 2000 by the rod in 1872. In England the *S.*-fisheries are protected by efficient inspection. The license-duties of the *S.*-fishings of England and Wales from 1867 to 1875 were as follows:—

Year.	Number of			Total men.	Revenue from			Total Revenue
	Net fish-men.	Rod fish-men.	General Licences.		Nets.	Rods.	Licences.	
1867	1029	2350	39	5379	£3851	£1816	£430	£6097
1868	3013	2076	29	5989	4921	1593	530	6844
1869	3083	2030	24	5133	4826	1420	320	6566
1870	2977	1616	23	4593	4757	1240	269	6266
1871	3383	2054	26	5437	5370	1469	307	7146
1872	2907	2310	24	5217	4552	1589	312	6453
1873	2900	2579	20	5488	4650	2031	143	6824
1874	1045	2779	27	3824	4974	2190	211	7381
1875	2970	2005	24	5575	4715	2080	202	7003

In Ireland a large number of rivers are supervised by the Irish Inspectors of *S.* fisheries. The *Shannon*, for instance, has a course of over 200 miles, a catchment basin of 4553 sq. miles, and its tributaries, the *Erne*, *Nore*, *Suir*, *Barrow*, *Moy*, *Ballisodare*, *Galway*, *Lee*, *Bush*, *Blackwater* (*Cork*), *Bann*, and *Foyle* are all notable *S.* rivers. It is a matter of note that the Irish *S.* fisheries are among the most valuable. The Report of 1874 estimates their annual value at £400,000.

The largest *S.*-rental of any river of the United Kingdom is that of the *Tay*, which in 1875-76 was £21,634, 4s. 4d., and in 1876-77 £20,381, 18s. 4d. The following table of the famous *S.* fishings in *Loch Tay* is interesting:—

Year	Number of Salmon Killed.	Aggregate Weight.	Average Weight.	Sum Drawn for Fishing.
		lbs.	lbs oz.	£ s. d.
1870	460	9,118	19 13	435 0 0
1871	114	2,270	19 14	807 15 6
1872	203	5,972	20 6	637 5 0

1874	253	5,495	20 15	962 17 6
1875	903	20,106	22 2	1,148 8 0
1876	476	9,786	20 10	1,248 0 0
Average	468	10,045	20 15	854 16 6

In the beginning of the present century the *Tweed* was by far the most productive *S.* river of which we have any record. At present the *Tay* produces a little more than 100,000 *S.* and *grilse* annually, and the *Tweed* only from 50,000 to 60,000 fish. This falling off is imputed by Messrs. Walpole and Laing, in their Report of 1875, (1) to the effects on the river of the improved system of land drainage; (2) to pollutions; and (3) to poaching. The statistics given of the *Forth*, *Spey*, *Dee*, *Don*, *Findhorn*, *Ness*, and other productive *S.* rivers are of equal interest, but we may simply give an extract of two of the most remarkable feats of *S.* capture by a single rod—the one achieved in Scotland on the *Beaully* by the present Lord Lovat, and the other in Canada, on the *Godbout* River, by *Comeau*, the river-watcher:—

Date.	Salmon and Grilse.

A subject of interest in connection with the S.-fishery has been the comparative lateness of some rivers as compared with others. Mr. Archibald Young, one of the commissioners of Scotch S. fisheries, from whose work much of the foregoing information is selected, has propounded a new theory to account for the comparative lateness or earliness of the S. rivers of Scotland. 'It may be stated generally,' he says, 'that the Scotch rivers that fall into the German Ocean to the Pentland Frith are early, whilst the streams that run into the Atlantic Ocean are late. What is the cause of this? As has been already stated, we have seen that the lake-at-the-head theory, and the more recent theory applied by Mr. Buckland to the English rivers, will not account for this difference. I do not presume to construct a theory to account for it, but I venture to hazard a conjecture, the truth of which farther observation may establish or overthrow. It is this: The Scottish rivers flowing into the German Ocean are almost all early rivers. They have comparatively long courses, and fall into the sea at considerable distance from their mountain sources, after running during some part of their career through districts not greatly elevated, and possessing a moderate climate. But the German Ocean into which these comparatively warm rivers flow, is a cold sea, and the slight difference between its temperature and that of the rivers running into it in winter and spring induces the S. to ascend early. Take the Tay, for example. It is well known that S. run into it in great numbers in the months of December and January; so that when the fishing begins in February, Loch Tay is fully stocked with clean and heavy fish. On the W. coast, on the other hand, the rivers that fall into the Atlantic are all late. They have short courses, and their sources are much tilted up, as they rise in that lofty and singularly picturesque chain of mountains, which, beginning not far S. of Cape Wrath, skirts the shores of Sutherlandshire, Ross-shire, and Inverness-shire for more than 100 miles, at distances varying from 5 to 29 miles from the Western sea. In winter and spring these mountains are snow-clad, and every partial melting of their snows brings down torrents of ice-cold water, which run through the short channels of these rivers into the sea. But the water of that sea, unlike that of the German Ocean that washes our eastern shores, is warmed by the soft influence of the Gulf Stream, and the S. consequently remain in it until the snow-water has run off, and the milder weather of May and June has raised the temperature of the river waters, and then they begin to ascend. This marked difference in the physical characteristics of the rivers of our eastern and western sea-boards is very clearly shown in the hydrographical map prepared for the Rivers' Pollution Commission, which faces page 24 of their sixth and last report.' It may be mentioned that the above theory, originated by Mr. Young, is being tested by means of observations taken by maximum and minimum thermometers of the different temperatures of the fresh and salt water by the Scottish Meteorological Society at their station on the river Ugie, and by other observers on the Spey and Tweed.

As there are no annual inspections and reports of the state of the Scotch S. rivers, it is, of course, far more difficult to ascertain their annual value than that of the English and Irish rivers, concerning which such reports are annually published. Mr. Young estimates their annual value at £250,000, though he states a much higher value might be assigned to them on very plausible

grounds. Thus, in the year 1874, 32,186 boxes of Scotch S. were sent to Billingsgate; so that, reckoning each box at £10, we get a sum of £321,800 as the money value of the Scotch S. sent to the London market alone in one year; and taking 12 lbs. as the average weight of each fish, we find a total of 300,346 S. as the number sent to London in the year mentioned. A statement of the value of the S.-fisheries in 1868 gives the annual value of the river fisheries of England, Scotland, and Ireland at £560,000. According to the latest calculation, their present value is about £750,000 annually.

The great rivers of N. America abound in S. of various species. The *Salmo salar* is found in some rivers in the State of Maine, and exists in very large quantities in the Canadian rivers, which are now taken charge of by the Dominion Government, and let to private persons for fishing. In the rivers of California, Oregon, and British Columbia, the *Salmo quinnat* is very common. It grows to a great size, and can live in rivers of a much higher average temperature than the *Salmo salar*, while in the more northern and colder rivers it exists in almost fabulous numbers. S.-tinning and -exporting industries on the Columbia River, Oregon, have attained vast proportions since 1873, and have been begun in several parts of the British possessions. In 1876 the United States exported 415,218 cases of S., representing the enormous take (chiefly from the Columbia) of 10,000 tons of fish. The shipment to Great Britain was 210,348 cases. Attempts have been made to introduce the *Salmo quinnat* in the rivers of the Eastern States, where it is now extinct. Efforts are also being made to naturalise the S. in the rivers of Tasmania, Victoria, and New Zealand, by exporting ova in large quantities from Europe.

Law Relating to S. and S.-fishing in the United Kingdom.—The chief Act now in force in England is 24 and 25 Vict. c. 109, which declares that every fish of the genus *Salmo* shall be legally deemed a S. The Act imposes penalties on putting, or allowing to flow, into any water containing S., any substance poisonous to the fish. Illegal implements and lures are specified, and forbidden under pecuniary penalties. Among these are spears, gaffs, lights, and S.-roe. General superintendence is vested in the Home Office, which appoints two inspectors for three years, and defines their duties. In 1873, the S.-fishing laws of England and Wales were again amended. Power is given to the Home Secretary to alter and combine districts and to alter the number of conservators appointed at Quarter Sessions. Further regulations are made regarding implements of fishing. No eel baskets are to be fixed between 1st January and 24th June. Close time for rod-fishing is from 1st November, and for nets from 1st September to 1st February; the penalty for infringement being £5. Fishing, except with rod and line, is prohibited within 50 yards above, and within 100 yards below, a weir or mill-race. Fishing, except with rod or line, is made illegal between noon on Saturday and six A.M. on Monday. Catching unclean fish is illegal, and no one may buy or sell S. between 3d September and 1st February, both inclusive, under a penalty of £2 for each fish. This does not apply to fish cured in legal time. The provisions of the Scotch Acts for protection of the fish are similar. There, the weekly close time is from six P.M. on Saturday to six A.M. on Monday. Commissioners are appointed by the Home Secretary, their duties being to fix the close time, and make regulations as to implements of fishing. The northern rivers close for net-fishing mostly on 26th August; their rod-fishing on 15th October. Tweed closes for nets on 14th September; for rod-fishing on 30th November. All reopen early in spring, mostly in February. As regards the right of S.-fishing in England, see RIVERS, LAW REGARDING. In Scotland, the right may be vested in one who has no land on either side of the river. It is constituted by grant from the crown, *cum piscatione salmonum*, or by conveyance of lands *cum piscationibus*, followed by forty years' possession of the S.-fishing.

Salmonidae, a family of *Teleostean* fishes, belonging to the division of the *Malacopteri abdominales*, in which the *ventral fins* are abdominal, being placed towards the rear of the body. The *swimming-bladder* is developed in S., and communicates with the throat by means of an air-duct. In the true S. the second dorsal fin is without rays, and is of soft consistence. In the genus *Salmo* itself, the head is smooth, and teeth are borne on the palate, vomer, and maxillary bones. In the nearly-allied genus *Scopelus* there are sharp teeth of conical shape in both

jaws. The genus *Serrasalpinx* has triangular teeth in both jaws, and a serrated abdominal line. The typical members of the family S. are active voracious fishes, which spawn in rivers and migrate to the sea.

Saloniki (Turk. *Selanik*; the ancient *Therma*, later *Thessalonica*), the chief town of a Turkish vilayet of the same name, and next to the metropolis the most important commercial town of the empire, is situated on the N.E. shore of a spacious gulf on the Aegean Sea, and on the steep slope of the mountain of Kortiash, 370 miles W.S.W. of Constantinople. Girt with cypress groves, against which its white buildings stand out in bold relief, it presents a highly picturesque appearance from the sea. Internally it is narrow, irregular, and gloomy, but it contains many interesting architectural monuments. The Greek quarter has a hippodrome of great antiquity, and ruins of a colonnade built under Nero. Most of the mosques were formerly Christian churches. One, inlaid with porphyry and jasper, was the celebrated church of St. Demetrius; that of St. Sophia was the prototype of the famous St. Sophia of Constantinople; while another is the former Rotunda, built after the model of the Pantheon. Other antiquities are the triumphal arch of Augustus commemorating the battle of Philippi, the arch of Constantine, and the ancient acropolis, now the Veli-Kuleh, or citadel of 'the Seven Towers.' Many rich discoveries have been made of mosaics, bas-reliefs, coins, &c. Protected by its citadel and several forts, S. is the seat of a governor-general, a Greek metropolitan, and Jewish grand chakam, and has a splendid situation for commercial purposes, forming the terminus of the road which leads across the peninsula from Belgrade. The S., -Uscup, -Mitrovitza Railway, 219 miles in length, the last section of which was opened in 1875, supplies the districts contiguous to Bosnia and Servia with iron and other British produce. In 1874 there entered the port of S. 812 vessels of 294,520 tons, and cleared 822 of 290,305 tons. The exports are wheat, barley, Indian corn, rye, cotton, and tobacco; the imports iron, coal, and manufactured goods. A large building for the storage of merchandise, to which are attached two piers, one for loading, the other for discharging, was constructed (1876) at a cost of £10,000. The works of the great S. quay were stopped in 1874 for want of an advance from the government of the funds required for its completion, some £15,000. Pop. 80,000, of whom 20,000 are Greeks and 20,000 Jews. The bulwark of the Eastern Empire during the barbarian inroads, S. was taken by the Saracens in 904, by the Sicilian Normans in 1185, and by the Turks under Amurath II. in 1430.

Saloop. See SASSAFRAS.

Sal'pa, a well-known genus of *Tunicate* (q. v.) Mollusca existing in two forms—*single S.* and *chain S.* The latter consists of a connected chain of individuals often attaining a length of several feet, and found swimming on the surface of the sea by means of the inhalation and forcible expulsion of water from their bodies. Like other tunicates, the S. has a curious breathing chamber into which water is admitted from without. The body is small and gelatinous. There is a single nervous ganglion. The single S. cannot produce young save by a process of *gemination* or *budding*, and by throwing off long connected *chain salpas*. Each member of a *chain S.*, on the other hand, has the power of producing young by true sexual reproduction, the young of the *chain S.* being invariably *single S.* This feature illustrates the phenomenon properly known as *metagenesis*.

Sal Prunelle is nitrate of potash cast in the form of cakes or balls. See NITRE.

Sal'aify (Fr. *salsifis*) is a purple-flowered biennial herb belonging to the *Chicoraceae* tribe of *Compositae*, called by botanists *Tragopogon porrifolius*, a native of N. Europe and Siberia. It has long been cultivated for its tap-roots, which are dressed for the table like carrots and parsnips, or served with white sauce, and are a delicate and pleasant vegetable. S. is now only occasionally seen in English gardens, but is extensively grown in other European countries, and judging from the writings of the last century, such was then the practice in England. As a remnant of this past cultivation the plant is sometimes met with in a semi-naturalised state in meadows, &c., but is not indigenous to the country. The root of *T. pratensis* (the goat's beard), a common British species, is also edible.

Salsette Island, an island off the W. coast of India, between the island of Bombay on the S. and the mainland on the E., with both of which it is now connected by stone causeways and also by railway. Area, 150 sq. miles; pop. (1872) 93,000. It forms part of the district of Tanna, and is a picturesque tract, with cultivated fields and mountains, in the latter of which there are rock temples, older and of greater size than the better known rock temples of Elephanta. There are also ruins of the churches and villas of the Portuguese, who maintained themselves here till 1739, when they were expelled by the Mahrattas. The British obtained possession in 1774. S. I. contains the Vehar reservoir, from which Bombay is supplied with water.

Salt, Manufacture of. Common S., the chloride of sodium, is an extremely abundant substance in nature. It is found in almost inexhaustible deposits as Rock S. in various parts of the world; from such deposits arise brine springs which are strongly impregnated with S., and the water of the ocean, as well as that of various inland seas, hold it in solution in inconceivable amount. From these various sources S. is prepared for use as an indispensable condiment in human food, and as a raw material in several most important and extensive chemical manufactures. In the United Kingdom great deposits of Rock S. occur in the New Red Sandstone strata in Cheshire and Worcestershire. In Cheshire, where the deposits are most largely developed, it occurs in two main beds, found, owing to faults and dislocations in the strata, at varying depths. In the neighbourhood of Northwich, the upper bed is about 1400 yards in breadth, $\frac{1}{4}$ miles long, and 60 feet thick; while the lower bed at the same locality has been pierced to the depth of 110 feet without coming to the bottom of the stratum. The great S. mine of Wieliczka, in Galicia, occurs in Tertiary strata, and has been excavated to a depth of 1800 feet, and extends E. and W. 9500 feet. Great deposits are also found at Stassfurt, in Saxony, associated with several other saline substances, and in numerous other localities throughout the world. It rarely happens that rock S. is obtained in a condition of sufficient purity to be used direct in culinary operations. It is therefore generally dissolved and used in the form of brine, unlimited quantities of which are obtained from the deposits by pumping machinery. When brine is of sufficient concentration for direct evaporation by artificial heat, it is run into large settling reservoirs, in which suspended impurities fall to the bottom, and the solution is treated with a certain proportion of lime to cause the decomposition and precipitation of the chloride of magnesium always present. The evaporation is conducted in shallow pans of riveted boiler-plate, made about 60 or 80 feet long by 20 to 40 feet broad, and 2 feet deep, heated by two or more fires from which flues carry the heat, as uniformly as possible, to all parts of the under surface. In such a pan the S. brine is evaporated down to the saturation point, and it is then run into another similar pan for boiling down, where the S. gradually falls to the bottom of the pan, and is scooped out by attendants, then drained and dried. The 'grain,' or size of the crystals of S. formed, vary with the rapidity of the evaporating process, small table S. being deposited by rapid boiling, while 'broad,' 'fishery,' and 'bay' S. are the result of increasingly slow crystallisation. Weak brines and sea-water are concentrated up to a definite strength before evaporating by heat. This is accomplished by a process of *gradation*, the most common method being to allow the liquid to percolate through a lofty stack built up of thorn faggots and branches. This process not only concentrates but purifies the brine. In the south of Europe the S. is obtained entirely by evaporation by the sun's rays, by exposing sea-water in shallow artificially formed beds, termed *Salines*; and in Norway highly saturated brine is obtained by freezing, pure water only congealing from the sea-water when exposed to intense cold. The total amount of S. produced in the United Kingdom during 1876 was 2,273,256 tons, of which 154,531 tons were in the form of Rock S. In the same year 854,538 tons, of a value of £529,547, were exported; British India, the United States, and Russia being the countries to which it was most largely sent. In the same year the Austrian yield amounted to 2,494,051 met. cwts., valued at 21,518,077 florins.

Salt, Spirits of. See HYDROCHLORIC ACID.

Salt, Sir Titus, an English philanthropist and great employer of labour, was born at the Manor House, Morley, 20th Sept. 1803. Owing less to a 'plain commercial education' received

at Wakefield than to the severe lessons of economy and diligence learned from his father, whom he assisted for some years as a wool-dealer, he began business independently as a wool-spinner in Bradford in 1834. He first introduced into England the manufacture of alpaca fabrics, and at the age of fifty, having made a large fortune as head of the great firm Titus S., Sons, & Co., he set himself to the task of improving the physical and moral condition of his workpeople. In the picturesque valley of the Aire, $11\frac{1}{2}$ miles by rail from Leeds, he planted his vast factory, which in 1876 covered an area of 20 acres, and around it he erected 895 model dwellings. This village, to which he gave the name of Saltaire, is perhaps the nearest approach ever made to the Utopia of Socialist dreamers and the Hygeia of modern science. The founder never used his wealth to sap in others the feelings of self-reliance which had made himself so wealthy. A staunch Independent, he would not allow teachers to 'inculcate the doctrines of any sectarian religious creed,' but left 'the duty of providing distinctively theological instruction to parents or guardians.' When the Board schools were opened he at once converted the elementary schools which he had founded into higher-grade schools with scholarships, bequeathing for educational purposes not less than £40,000. He served as Mayor of Bradford, sat in Parliament (1859-61) as an advanced Liberal, and was made a baronet in 1869. His statue at Bradford was unveiled by the Duke of Devonshire in 1874. He died 29th December 1876. By his generous example he taught great capitalists that property has its duties as well as its rights. See *A Life by Rev. R. Baggamie* (Lond. 1877).

Saltcake. See SODIUM.

Saltcoats, a seaport in the county of Ayr, Scotland, 7 miles N.W. of Irvine (q. v.), and 1 mile S.E. of Ardrossan (q. v.), and a station on the Glasgow-Ardrossan Railway. It had formerly some shipbuilding, and a trade in timber and salt. The latter industry now alone survives. The sea-bathing is good, and a large number of moderate-sized but elegant villas have been erected. Pop. (1871) 4264.

Saltill'o, capital of the state of Coahuila in Mexico, on the Tigre, was founded in 1586. It has long been a place of considerable importance, and its population in 1831 was upwards of 30,000. The battle of Buenavista was fought near S. in 1847. During the late wars the town has gradually declined, and now contains only about 15,000 inhabitants.

Salting is one of the processes most commonly adopted for preserving meat, fish, and other animal food from putrefactive change. In dealing with meat two processes are followed, dry S. and pickling or wet. In dry S. the meat to be cured is carefully rubbed over with a mixture of common salt and saltpetre in the proportion of 1 ounce of the latter to every pound of salt used. The meat is laid on a board where the brine may drain away from it, and the rubbing in of a proportion of the salt compound is occasionally repeated at an interval of a day or two till the meat is sufficiently cured. The addition of sugar to the salt mixture gives an improved flavour to mild-salted meat. In pickling, the meat is either treated as above indicated, but placed in a cask where brine accumulates around it, or it is at once plunged into a strong brine, and after sufficient exposure it is withdrawn and hung up to dry. The curing of mild-salted provisions is frequently finished by a process of smoking.

Sal'tire, or Sal'tier, in heraldry, is an honourable ordinary, consisting of a diagonal cross, formed by a bend and bend sinister crossing at right angles. The S. contains *one-fifth* of the field; when charged, *one-third*. From the belief that St. Andrew suffered martyrdom on such a cross, the S. is also called a St. Andrew's Cross.

Salt Lake City (called by the Mormons *Deseret*), capital of the U. S. territory of Utah, and the stronghold of Mormonism (q. v.), stands on a beautiful and fertile plain between the Great Salt Lake (from which it is 11 miles distant), and the Wahsatch Mountains, a branch of the Rocky Mountains. It is 36 miles S. of Ogden, the junction of the Utah Central Railroad with the Central and Union Pacific Railroads, and is regularly laid out in transverse streets, each 137 feet wide, with numerous avenues of trees, and in many cases with brooks of clear water flowing through them. The principal buildings are the Mormon Tabernacle, a huge oval building with a metal roof, capable of

seating 8000 persons, and containing one of the largest organs in the world; the Theatre, the City Hall, the Zion Co-operative Stores, and several handsome villas occupied by the leading Mormons. There are five churches, a 'University of Deseret,' and many public schools; two Mormon and two 'Gentile' newspapers, as well as a weekly newspaper published in Danish, a large number of the population being Scandinavians. There are hot sulphur-springs and baths close to the city. A United States military camp has been established at Fort Douglas, about 2 miles to the southward. A new and very large Mormon Temple is in course of erection close to the Tabernacle, but progresses slowly. Pop. (1870) 12,854; estimated in 1877 at 22,000.

Salt of Sorrel. See OXALIC ACID.

Salt of Tartar is the impure carbonate of potash, which results from the decomposition by heat of Cream of Tartar (q. v.).

Salt of Tin. See TIN.

Salt Range, The, a hilly tract which runs from E. to W. across the districts of Jhelum, Shahpur, and Kalabagh, in the Punjab, British India. It terminates abruptly on the bank of the Jhelum river. The northern ridges form a continuation of the Himalayas and Suleiman Mountains. The highest point is 3701 feet above the sea. The geological structure of this range is a series of belts of Devonian, Carboniferous, Oolite, Eocene, and Miocene formation. Besides salt, which is found in solid cliffs in the red marls and sandstone of the Devonian group, the following substances abound:—building-stone, marble, gypsum, coal, sulphur, copper, lead, and hematite. The salt was worked in the time of Akbar, and the best-known workings are now called the Mayo Mines. Shafts are sunk by pick and hammer, or by blasting; and the miners earn from 6d. to 9d. a day. The salt is a government monopoly. The annual out-turn is about 100,000 tons, and the revenue £400,000. A tramway now leads from the town to the newly opened railway. The coal has not yet been profitably utilised.

Salts, in chemistry, include a great variety of compound substances, concerning the properties of which no general statements can be made. The name, originally limited to common salt, was extended first to substances which in their solubility, crystallisation, or other property, resembled this widely distributed material. By the old chemists, common salt was regarded as formed by the union of hydrochloric acid and soda—that is, by the union of an acid and a base. By a natural generalisation all compounds which resulted from the combination of any acid and base were termed S.; and this was the accepted theory of the constitution of S. even after the prototype of the group, common salt itself, had been proved by Sir H. Davy to be not so constituted. This eminent chemist showed that a double action took place when hydrochloric acid (HCl) and soda (Na₂O) acted upon each other—the hydrogen in the acid combined with the oxygen in the base to form water, while the chlorine and sodium combined to form common salt,

Common salt, then, in its constitution is not a salt at all according to the dualistic theory indicated above. The nature of this theory is well illustrated by the sulphates. Thus sulphate of zinc has the formula ZnSO₄, or ZnO.SO₃, as the supporters of the dualistic theory would write it. Here the acid is SO₃, not H₂SO₄. Indeed, according to this theory, ordinary sulphuric acid is as much a salt as any sulphate, being the sulphate which has water for its base (H₂O.SO₃). From these examples it is evident that to accept the dualistic theory as a scientific truth, would necessitate a complete revolution in the nomenclature of our acids—all the hydrated acids being S. with water as base. Further, the failure of the theory in relation to the formation of the nalcid S., the chlorides, bromides, iodides, &c., marks it as unsatisfactory and unscientific; and among modern chemists the theory has been abandoned for another, which has been gradually gaining ground since the discoveries of Davy, who originated it. This theory, which receives powerful support from electrolytic decomposition, regards every salt as made up of a metal combined with another element, or group of elements, which is known as the salt-radical. An acid must now be regarded as composed of hydrogen in combination with one of these radicals, and if this hydrogen is, in whole or

in part, exchanged for a metal or something equivalent to it, a salt results. A base is simply a substance which is capable of neutralising an acid; hence S. may be defined as compound substances which result from the neutralisation of an acid with a base, the hydrogen of the acid being exchanged, in whole or in part, for a metal or some radical equivalent to it. This reaction is usually accompanied by the formation of water together with the salt. Upon this view the different compounds of a given metal differ only in the nature of their salt-radical, and the quantities of these which combine with the same quantity of the metal are chemically equivalent (see ATOMIC THEORY and EQUIVALENT). All the chlorides are formed by the union of an equivalent of chlorine with an equivalent of any metal or similar radical. The sulphates have the radical SO_4 (sulphion) where the chlorides have chlorine, and so on. The radicals, which thus form acids with hydrogen and salts with metals, are either the non-metallic elements, or groups of elements with a relatively large proportion of oxygen. If part of the metal or equivalent radical in a salt is replaced by hydrogen, the resulting compound is called an acid salt, and if part of the acid radical is replaced by oxygen or hydroxyl (OH), basic S. result. Thus plumbic chloro-hydrate (PbClOH) is a basic salt formed from plumbic chloride (PbCl_2), by the substitution of the radical OH for the element Cl.

S. may be formed in a variety of ways. Direct union of the elements is sometimes effectual, as in the case of common salt ($\text{Na}_2 + \text{Cl}_2 = 2\text{NaCl}$). Metallic zinc is acted upon by sulphuric acid, and sulphate of zinc is for evolution of hydrogen—a case of direct action of a metal upon an acid. Carbonic acid and lime combine directly to form the carbonate ($\text{CaO} + \text{CO}_2 = \text{CaCO}_3$). The most usual methods are, however, by the action of an acid upon a base, and by double decomposition of two S. An example of the former has already been given. As an example of the latter, mix together equivalents of plumbic nitrate and sodic sulphate in water, and there result sodic nitrate and plumbic sulphate, the latter of which being insoluble appears as a precipitate—

This more recent theory of the constitution of S., though not without many difficulties, is much more satisfactory than the dualistic theory. As a working hypothesis, too, it is the simplest; in this respect having a great advantage over a third theory, which we cannot do more than mention—that, namely, which regards all compounds as constituted upon the type of water.

Salts, Smelling, consist of the pungent sesquicarbonate of the carbonate of ammonia, with the addition of a few drops of one or more of the essential oils. The following is an example of a recipe:—Carbonate of ammonia 1 lb., oil of lavender 2 ounces, essence of bergamot 1 ounce, clove oil $\frac{1}{2}$ ounce, rub all together and sublime, keeping the produce in well-stopped bottles.

Sal'twort (Lat. *Salsola*) is a genus of about thirty species of maritime herbs and shrubs inhabiting saline districts in temperate regions. It belongs to the natural order *Chenopodiaceæ*. One herbaceous species of rigid straggling habit, with spreading and recurved, fleshy, spine-pointed, nearly cylindrical leaves, is common on the sandy sea-shores of the British Isles, and was formerly burnt for Barilla (q. v.), as was also *S. Soda*, a succulent annual species of S. Europe and N. Africa, together with other allied species of Saline Plants (q. v.).

Salute', Military and Na'val, are made by the touching of the hat or cap, the lowering of swords or colours, the presenting of arms, firing of cannon, cheering, &c. A soldier in the British army on passing an officer salutes on the fourth pace before reaching him, and lowers the hand on the fourth pace after passing him. When an officer passes a soldier at the halt, the latter salutes when at a distance of four paces, and lowers the hand after a pause of six paces in quick time. A general salute to a distinguished person is made by troops presenting arms, officers lowering swords, the band playing, &c., and sometimes the firing of *feux de joie*. An artillery salute consists of firing twenty-one guns in the case of royal visits and anniversaries, and of various numbers of guns, according to rank, when in honour of officers and diplomatic dignitaries.

Saluzzo, a town of N. Italy, province of Cuneo, 10 miles W. of Saviglio by rail. The chief buildings are the old castle,

the former residence of the Marquises of S., used as a penitentiary since 1828; the Gothic cathedral, dating from 1480; and the churches of S. Bernardo and S. Domenico, with monuments. S. manufactures leather, silk, and hats, and has trade in cattle, corn, wine, and ice. Pop. (1874) 15,446.

Sal'vage. See WRECK AND SALVAGE.

Salva'tor Ro'sa. See ROSA, SALVATOR.

Sal'vo Regi'na, an old antiphony of the Roman Catholic Church, addressed to the Virgin Mary. It is sung from first Vespers of Trinity Sunday to Advent.

Salvi'ni, Tommaso, a distinguished Italian actor, born in Milan in 1829. His precocity procured his admission, at the age of fourteen, into a good dramatic company, where he received lessons from Modena. He was subsequently engaged in the royal company at Naples, and he played for six years in Domeniconi's company by the side of Adelaide Ristori. He afterwards retired for a time from the stage, during which he carefully studied the classic drama. He was a leading performer in the *fêtes* at Florence on Dante's sixth centenary in 1865. He subsequently undertook a lengthened tour through Italy, Spain, Portugal, and S. America, and in 1872-73 he visited the United States. His appearance at Drury Lane in 1875 in three of his most famous characters, 'Hamlet,' 'Othello,' and 'The Gladiator' in Soumet's tragedy, produced a furore of admiration. He appeared again in London in 1876. S. is a scholarly and cultivated man, of great ability as a comedian, of genius as a tragedian. He has a fine presence, a handsome and expressive face, and a noble bearing. His voice is magnificent in quality, and his elocution perfect. His excessive physical force, unequalled on the modern stage, sometimes mars his tragic style, by investing it with a certain savagery, while it unfits him for the illustration of pathos, tenderness, and the inner workings of the soul.

Sal'vo, a simultaneous and concentrated artillery-fire. Salvos come chiefly into requisition during the operations of a siege. Breaching guns when fired in salvos are terribly destructive to masonry, but in recent (such as the Russo-Turkish) wars their effect has not been so decided against powerful earthworks.

Salween', a considerable river of Asia, supposed to rise in the Chinese province of Yunnan. It debouches into the sea in British Burmah, after a total course, almost due S., of 750 miles; area of drainage basin, 62,700 sq. miles. The city of Moulmein (q. v.) has grown up at its mouth, shortly above which it is joined by the Gyne and Attaran rivers. Immense quantities of timber, chiefly teak, are conveyed down the stream; but the banks in British territory are said to be becoming denuded of large trees.

Salz'brunn, a straggling village in Prussian Silesia, the three parts of which are distinguished as *Ober*-, *Nieder*-, and *Neu-S.* It is situated on the river Salzbach, and lies about 5 miles S.E. of Friburg by rail.—The district has extensive brick and tile works, besides coal mines, and is, next to Warmbrunn, the most important bathing-place in Silesia. The baths are ten in number, and yield alkalo-saline water. Pop. (1871) Ober-S., 3238; Nieber-S., 941; Neu-S., 448.

Salz'burg (the ancient *Juvavum*, *Juvavia*), one of the most picturesquely situated towns of Austria, capital of the crown-land of S., is built on both sides of the Salzach under the Kapuzinerberg on the right, and the Mönchsberg, crowned with the fortress Hohen-S. on the left, 13 $\frac{1}{2}$ miles N.N.E. of Reichenhall by rail. The river is crossed by three bridges, below one of which, the Stadtbrücke, large embankments have been recently erected. On its left bank is the older quarter of the town, the finest part of which is the Residenz-Platz, containing the Residenz-Schloss, erected in 1593, and having in its centre the Hofbrunnen, 46 feet high, completed in 1644. Opposite is the Neubau, a pile of Government buildings; and on its S. side the cathedral, erected 1614-55. In the adjacent Mozart-Platz is a bronze statue to Mozart, who was born here in 1756, in a house still standing in the Getreidegasse. S. has seven monasteries and twenty-six churches, the finest of which are the church of St. Peter, a Romanesque edifice of 1127, with an ancient burial-ground, and the Franciscan church, a building of the 13th c. The town has a museum containing a library of 20,000 vols., and many valuable works of art; an upper gymnasium (which was a univer-

sity, 1623-1810), with a library of 36,000 vols., 1300 rare MSS. and early printed works; and several institutions for the study of the fine arts, among them the Mozarteum, a school of music, containing MSS. and the piano of Mozart. S. has manufactures of woollen wares, leather, tapestry, lead-pencils, mirrors, pianofortes, besides important lithographing, copperplate-printing, and type-founding establishments. Pop. (1870) 14,615.—The crown-land of S. has an area of 2767 sq. miles, and a pop. (1869) of 153,159.

Salzkamm'ergut ('Salt-exchequer property'), called also Austrian Switzerland, a mountainous district of Austria, lying between Styria and Salzburg, and bounded by the rivers Salzach and Enns. Area, 250 sq. miles; pop. 17,500 (3500 Protestants). Its scenery is of the greatest variety and beauty, presenting wooded mountains rising to the region of perpetual snow, alternating with verdant valleys interspersed with sequestered lakes. The chief mountain groups are the Tennengebirge (7967 feet), stretching to the right of the Salzach; the glacier-covered Dachstein (9848 feet), W. of the former and S. of the Hallstätter See; the Todt-Gebirge (6716 feet), in the N.E. corner, lying along the beautiful Gosanthal; the Hölle-Gebirge, in the N.W., between the Traunsee and Attersee; and the Schaffberg, between Attersee, Mondsee, and Wolfgangsee. The most beautiful lake is the Traunsee, 8 miles in length, and connected with the Hallstätter See by the river Traun. S. has valuable mines and springs of salt, producing annually 56,000 tons of salt, and giving employment to nearly 7000 of the inhabitants. The chief seats of the salt works are Ischl, Hallstadt, and Aussee. The capital of S. is Gmunden.

Salzwedel, a town of Prussian Saxony, on the right bank of the Jeetze, an affluent of the Elbe, 51 miles S.E. of Lüneburg by rail. It has five churches, and carries on manufactures of cloth, linens, woollens, and cottons, besides sugar-refining, brewing, and dyeing. Pop. (1875) 8205.

Samany and Dailamy Dynasties. See PERSIA, History.

Samar', one of the Philippine Islands (q. v.), with an area of 13,020 sq. miles, with a pop. (according to Dr. Meyer in the *Mittheilungen* of 1874) of 250,062, most of whom are Mestizoes. The mountains of S. are higher than those of any other island in the group, having an altitude of over 7000 feet. The trade is chiefly in wax, cabinet woods, palm-oil, and mat-work. Catbalogan is the chief town and seat of trade.

Sama'ra, a government of Russia, bounded W. by the Volga, and E. by the Kirghiz steppes, and surrounded by the governments Astrakhan, Saratov, Simbirsk, Kasan, Ufa, and Orenburg. Area, 60,207 sq. miles; pop. (1870) 1,837,081, of a very mixed character. S. is everywhere fertile, save on the mountainous steppe, in the S.E. The W. has rich pastures occupied by German colonists. In the S. the chief occupations are corn-growing and cattle-rearing; in the N. are manufactured cloth, leather, potash, brandy, and tallow.—**S.**, the capital, at the confluence of the S. river with the Volga, 208 miles E. of Sysran by rail. It has four churches, and one of the greatest corn and wool markets on the Volga. It exports also lambskins, fish, and tallow. Pop. (1870) 51,947.

Sama'rang, a town of Java, and the capital of a Dutch residency on the W. coast of the island, and at the mouth of a river of the same name. It is connected by railway with the town of Djokjokarta, on the S. side of the island, and is a great entrepôt for sugar, rice, pepper, coffee, &c. In 1877 the passenger receipts of the railway amounted to £42,947, and the merchandise receipts to £192,313. S. has a shallow harbour and an unhealthy climate. Pop. 30,000, including many Chinese.

Sama'ria (Lat., Gr. *Samaricia*, Heb. *shomeron*, 'watch-height,' probably so called from the nature of its situation, although a different etymology is given in 1 Kings xv. 24), the ancient capital of the kingdom of Israel, was built by Omri (about B.C. 925), on an oblong hill about six miles to the N.W. of Shechem. S. continued to be the capital of Israel till its capture by Shalmaneser (B.C. 721). According to Eusebius (*Chronicon*) the city was taken by Alexander the Great; and it was again taken by John Hyrcanus and razed to the ground (B.C. 109;

Jos. *Ant.* xiii. 10, 2, *Bel. Jud.* i. 2, 7). In the time of Alexander Jannæus (B.C. 105-79) it was in the possession of the Jews, but Pompey restored it to the descendants of the old Samaritans (*Ant.* xiv. 4, 4). It was rebuilt first by Galbinus (*Ant.* xiv. 5, 3), and more completely by Herod, who fortified it and peopled it with a colony of 6000, calling it Sebaste (Gr. Augustus), in honour of the Emperor (*Ant.* xv. 8, 5, *Bel. Jud.* i. 21, 2). Sebaste was taken by the Moslems during the siege of Jerusalem (637). A bishopric was established there by the Crusaders, which existed till the 14th c.; and at the present day all that remains of S. is an Arab village called *Sebastieh*.

The name of S. was also applied to the whole territory over which Jeroboam made himself king (*cf.* 1 Kings xiii. 32), but after the conquests of Tiglath-pileser (2 Kings xv. 29, 1 Chron. v. 26), it was confined to the central part of Palestine lying between Galilee and Judah. The people who were carried off by Shalmaneser to Assyria consisted of the greater part of the inhabitants of S. and the adjacent villages (not the whole of them, as some maintain; *cf.* 2 Chron. xxx., xxxiv. 6, 7, 9). To supply their place, colonists were brought from Assyria, probably by Esar-haddon, about B.C. 677 (2 Kings xvii. 24, Ezra iv. 2-10), so that the inhabitants of the province of S. were now a mixed race, the non-Jewish element having preponderance. On the return of the two tribes from Babylon the Samaritans wished to co-operate with them in rebuilding the temple at Jerusalem; and when this was refused, a feud began between them and the Jews, which only increased with lapse of time (Ezra iv. 2-10). After the Samaritans built on Mount Gerizim (q. v.) a temple which rivalled that at Jerusalem, the two communities hated each other with a perfect hatred (*Ant.* xviii. 2, 2, xx. 6, 1, John iv. 9). When this temple was destroyed by John Hyrcanus (*Ant.* xiii. 10, 2, 3), they built another at Shechem (q. v.); but Gerizim remained their holy place, on which they celebrate the Passover to this day. The Samaritans have now dwindled down to the scanty but tenacious community of Nablus. See Robinson's *Bibl. Researches* (3d ed. Lond. 1867), Stanley's *Sinai and Palestine* (new ed. 1871), *Jewish Church* (6th ed. Lond. 1875). *A Sketch of Samaritan History, Dogma, and Literature; Published as an Introduction to Fragments of a Samaritan Targum, edited from a Bodleian MS.* by J. W. Nutt, M.A. (Lond. 1874).

Samaritan Pen'tateuch, the version of the Pentateuch in use among the Samaritans, which is written in the ancient Hebrew or Samaritan character, was alluded to by certain early writers—Cyril of Alexandria, Eusebius, &c.—but was otherwise unknown till Pietro della Valle obtained a copy of it from the Samaritans in Damascus in 1616. This copy was presented by the French ambassador at Constantinople to the library of the Oratoire at Paris (1623); was first described by Morinus in his preface to the lxx. (1628), and then printed in the Paris Polyglott. Morinus in his *Exercitationes Eccl. in utrumque Sam. Pent.* (Par. 1631), pronounced the newly-found codex to be greatly superior to the Hebrew Pentateuch. A controversy on the subject was carried on for two centuries, but was almost finally settled against the view of Morinus by Gesenius, who in his dissertation (*De S. P. Origine, &c.*, 1815) showed that the S. P. is of no critical value.

Regarding the *age* and *origin* of the S. P. the most divergent opinions have been entertained. 1. One opinion, held by a great number of able critics, is that the S. P. was received by the Samaritans as an inheritance from the ten tribes. The arguments for this opinion are—(1) that it is improbable they should have received it from the Jews after the Captivity on account of the bitter enmity which existed between the two communities; (2) the Pentateuch being the only part of the Jewish canon included in the Samaritan canon, it is improbable that they had received it after the Hagiographa (q. v.) and the Prophets were added to the former; (3) being written in the ancient Hebrew character, it must have been written before the change of that character into the square Hebrew letters, which took place at the end of the Captivity. The correctness of this theory is intimately connected with the origin of the Hebrew Pentateuch. If the Pentateuch did not take its present form till the time of Manasseh or Josiah, as many critics hold, or even till after the Captivity, as others maintain, the above theory is obviously incorrect. 2. The other leading opinion is that the origin of the S. P. must be looked for at the time when the Samaritans (q. v.) separated themselves for ever from the Jews as an independent

sect. According to some, it was brought from Jerusalem about B.C. 409 by Manasseh. More probably it was got after their temple was built and their worship established, and since so many of its readings agree with the *lxx.*, while differing from the Hebrew Pentateuch, it must have come directly or indirectly from the Jews in Egypt. On the other hand, as it undoubtedly originated before the *lxx.*, its most probable date is about the end of the 4th c. B.C. See Smith's *Dict. of the Bible* (1863); Davidson in Kitto's *Cyclo. of Bibl. Lit.* (3d ed. 1876).

Samarkand', a town of Russia, government of Turkestan, Central Asia, 32 miles S. of the river Zerafshan, and 130 miles E. of Bokhara. It has followed the changes in the course of the river, so that it consists of an old and a new town, the former containing the most interesting buildings. These are the tomb of Kasim-bin-Abbas, the mosque and tomb of Timur, and the citadel, which is situated on a hill at the S. W. corner of the city, and has now a Russian garrison. Other buildings are the palaces of the early Emirs and the Begs, of which one has been converted into an hospital and magazine for stores, and the other into bureaux for the Russian officials. S. has considerable industry, chiefly in the manufacture of silk, cotton, and paper, and work in enamel. Pop. (as estimated by Schuyler in 1873) 30,000. S. was the *Maratanda* of the ancient Greeks, and was termed by its inhabitants *Tshin* until it received its present name from the Arab Samar, who introduced Islamism in 643. In 1219 it was taken by Jenghiz Khan, and 200 years later it was the capital of the vast empire of Timur. It was long the centre of the Mohammedan learning of Turan, and it has been much celebrated in the poetry and romance of Persia. In 1868 it was taken by the Russians under General Kaufmann after a bloody struggle, and it is now the furthest point of their mission of conquest and civilisation in Central Asia. See Vámbéry's *Travels in Central Asia* (Lond. 1864); Petermann's *Geogr. Mittheilungen* for 1865; and E. Schuyler's *Turkestan* (Lond. 1876).

Sambhur Lake, a shallow expanse of water, strongly impregnated with salt, in Rajputana, British India, lying between the two states of Jeypore and Jodhpore, each of which owns a half of it. It is about 50 miles in circumference, but varies greatly in extent according to the season of the year. In the hot weather, the salt is found crystallised on the bottom which has been left dry. When collected it is of a reddish colour, but on being exposed to the sun it becomes of an excellent quality. This lake is now leased by the British Government from the two Rajput chiefs to which it belongs. The N.W. Provinces are chiefly supplied from this source; and for the prevention of smuggling, a customs line consisting of a hedge is run along for a distance of 2375 miles. The salt revenue along this line amounts to £1,400,000, at £8. 8s. per ton. The new Rajputana Railway, opened in 1872, has its terminus at S. L.

Sam'bor, a town of Austria, in Galicia, on the left bank of the Dniester, has manufactures of linen and iron. Pop. (1869) 11,749.

Sam'bre (Lat. *Sabis*), a tributary of the Maas, rises in the French department of Aisne, and after a N. W. course of 115 miles, 58 of which are in Belgium, joins the main stream at Namur. The S. is navigable for 100 miles, and is joined with the Oise by a canal. On its banks Julius Cæsar defeated the Nervii, B.C. 56, and it formed the line held by the Allies which was carried by the French under Jourdan in the battles at Rouvroi, Merbes-le-Château, and Gosselies, May 10 to June 4, 1794.

Sambur or **Sambu**. See *RUSA*.

Sam'nites, a people of ancient Italy, who occupied a mountainous district in Central Italy, W. and N.W. of Naples, extending from about Isernia to the sources of the Calore. They were probably a body of Sabine (q. v.) emigrants, who, entering a district occupied by Oscans, conquered and amalgamated with them. The nation thus formed was one of the bravest in Italy, and long disputed with Rome the mastery of the peninsula. In 354 B.C. they formed a league with Rome (q. v.), but in 343 the First Samnite War broke out, and continued with varying success till 341. After another alliance, the Second Samnite War commenced in 326, and though the Romans were humiliated in 321 at the Caudine Forks, the S. had on the

whole the worst of it. The war ended in 304. In six years the Third Samnite War began, and lasted till 290, the Romans being again victorious. In the Fourth Samnite War (282-272) the S. were thoroughly crushed, but continued to treasure hostility to Rome, aiding Hannibal during the Punic Wars, and heading the Italian league in the Social War (89). They sided with Marius against Sulla, but the latter laid waste their lands and almost exterminated the nation (82 B.C.).

Samo'a, or **Navigator Islands**, a group in the S. Pacific, situated between 13° 40'-14° 40' S. lat., and 168°-173° W. long. They are nine in number, and possess an area of 1087 sq. miles, with a pop. estimated at 33,000 in 1875. The three largest islands are Savaii, Upolu, and Tutuila. Rose Island, the most easterly of the group, is of coral formation, but the others are of volcanic origin, and are very mountainous, some of the peaks being 3000 feet high. They are clothed with splendid forests, and possess a soil capable of yielding all kinds of tropical products. S. has a growing trade with Sydney, Germany, and the United States, and in 1876 the imports and exports (exclusive of goods merely in transit) amounted in value to £116,000 and £111,000 respectively. Cotton, copra, cocoa-nut oil, and bêche-de-mer are at present the chief articles exported. Ethnologically the islands are of special interest (see *POLYNESIA*). The inhabitants possess the finest physique of any in Polynesia, and are brave and intelligent, but indolent. They are governed by a king and parliament (so-called) composed of hereditary chiefs, but to put an end to deadly internecine strifes the establishment of an American or British protectorate has been solicited on several occasions since 1872, though as yet (September 1878) without success. The capital is Apia, on the island of Upolu. Missionaries have long successfully laboured in the islands.

Sa'mos (mod. Gr. *Samo*; Turk. *Syssam* or *Susam Adasi*), an island of the Ægean Sea, on the W. coast of Asia Minor, near Ephesus, is 25 miles long and of varying breadth. Area 175 sq. miles; pop. (1877) 35,878, of whom upwards of 34,000 belong to the Greek Church. The island is very mountainous, the chief summits being Mount Ampelos and Mount Kerkis (anciently Cerceteus) 4725 feet high. The soil is rich in marble, zinc, lead, and silver, but though a company has been formed to survey the island there are as yet no mines. The island produces excellent wine of various kinds, of which £25,000 worth was exported in 1875; and raisins, of which £30,000 worth was exported. The total value of the exports in that year was about £100,000; of the imports about £90,000. During 1875, 74 steamers (69 English) with aggregate tonnage of 28,037, and 4801 sailing vessels with aggregate tonnage of 41,138 entered the ports of S. There are in the island 41 schools with 2833 pupils. The nominal capital is Megah Chora, the seat of the bishop. The chief town and seaport is Vathy, to which belong 236 Samian ships with aggregate tonnage 5717. In ancient times S. was very important. Samian sailors were famous, and first passed through the pillars of Hercules. Under Polycrates S. rose to great maritime eminence, and here the Persians were finally expelled in 479 B.C. During the Roman rule its history was uneventful, but its possession was more than once contested in the Middle Ages, and its population, which in ancient times had exceeded 250,000, sank for a while to a few thousands. The Samians fought resolutely during the Greek War of Independence, but were not liberated. However, on the 11th December 1832 the Sultan issued a firman making the island a tributary principality. A Greek prince named by the Sultan calls an assembly of thirty-seven deputies. These select a council of four. There are native law courts and a native gendarmie, but 200 Turkish soldiers remain permanently at Vathy.

Samothrace' (Mod. Greek, *Samothraki*; Turk. *Semenderek*, *Semadrek*), an island in the N. of the Ægean Sea, 23 miles from the Thracian coast, and belonging to the Turkish vilayet Diezairi Bahri Sefid. Area, 71 sq. miles; pop. 1800, almost exclusively Greeks. The island is 8 miles long by 6 broad, and consists of a wooded mountain-mass rising in Mount Fingari to 5240 feet. No island in the archipelago attains such a height except Crete. There are several valleys of exceptional fertility. S. has no harbours; it was in ancient times described by Pliny as *importuissima omnium*. The chief place is the village of Kastro on the S. coast.

Samoyedes, a people of North Russia, allied apparently to the Lapps and Finns, but more degraded. Formerly the inhabitants of the whole Siberian plain, they are now mainly confined to a region in the extreme N., extending between the White Sea and the river Yenisei. Small, indolent, and peaceable, they are still little influenced by civilisation, and live by herding reindeer and collecting fish and furs. The *khasovo*, or *nenetch* (i.e., 'men'), as they call themselves, number 30,000, according to the *Statistique Militaire de la Russie* (St. Petersburg, 1871). A collection of all the articles in use among the Ostiaks and S. of N. Siberia, made by Dr. Finsch during his travels in 1876, was presented to the Berlin Ethnographical Museum in 1878.

Samphire (*Crithmum*) is a genus of Umbelliferae consisting of a single species named *C. maritimum*. It is a fleshy, glabrous, much-branched herb, with a woody root-stock; and has triternate compound leaves; many-rayed flat-topped umbels of greenish-yellow flowers; an oblong, terete fruit, each carpel having five elevated ridges and many vitæ. The plant occurs in Europe, on maritime rocks around the Atlantic and Mediterranean coasts from France southwards, also on the N. African seaboard. In the British Isles it extends N. to Ayrshire. From its native habitat, or from garden-grown plants watered with sea-salt, the leaves are gathered to form a very desirable and old-established pickle. In lieu of them, sometimes those of the golden S. (*Inula crithmoides*) are substituted, and are nearly as acceptable; but another and common substitute, *Salicornia herbacea* (see GLASSWORT), is stringy, and altogether lacks the piquancy of real S.-pickle. S. was long since dedicated to St. Peter, whence its name by contraction of the Italian *Herba di San Pietro*. The older and more correct spelling was Sampire and Sampier, from Fr. *Saint-Pierre*.

Samsö, a small and very fertile island of Denmark, lying between Zealand and Jutland. Area, 42 sq. miles. Pop. (1870) 6335. It is 16 miles long, and 5 miles at its greatest breadth. The principal place is Nordby on the N. coast.

Samson (Heb. *Shimshon*, from *Shemesh*, 'the sun') is described as a Danite, who was a Nazarite (q. v.) from his birth, and who killed many of the Philistines in the course of his life, and although finally overpowered by them, took a terrible revenge upon them at his death (Judges xiii.-xvi.). A twofold difficulty has been felt in the history of S., namely (1), that he is improperly called a 'judge,' even in the sense in which it is applied to the others, since his deeds do not aim at the liberation of the nation, or even of his own tribe, and (2), that 'most of these deeds far exceed the bounds of credibility.' It is the opinion of some modern critics that the life of S. is founded on a solar myth, similar to those in which the sun-god in other countries was personified as a king, a hero, a hunter, &c.; e.g., the Egyptian Osiris, Syrian Adonis, Grecian Herakles, Phœnician Baal, Babylonian Thammuz, or Norse Balder, with which have been interwoven the exploits of some Danite hero, such as Shamgar (Judges iii. 31), and the whole remodelled after the ideas of the prophets of later times. Various particulars of the story are so interpreted as to confirm this view. Thus he is called a Nazarite, although he has not a single characteristic of the class; indeed, his whole life is opposed to the idea of his belonging to it, with the single exception of his long hair, which, however, is a universal symbol of the sun's rays. Again, it is said, the well-known riddle (Judges xiv.) is not satisfactorily explained by the story on which it professes to be founded, but only by the idea that honey is made while the sun is in the constellation Leo! The story of the 300 foxes or jackals and the firebrands (Judges xv.) is explained as a myth of thunder-clouds, from the points of which the lightning-flashes dart. The story connected with it, of his killing a thousand Philistines with the jaw-bone of an ass, out of which there afterwards flowed a supply of water, is compared with the Hindu myth of Indra, the god of day, whose cows (the clouds) were stolen by a wicked spirit (the scorching drought), but who pursues the thief, beats him (with the rod of his lightning), and then brings back his cows, while their milk (the rain) is poured out over the earth. The Delilah-episode and the last scene in the temple of Dagon are explained as myths of the sun's course during the Winter, when he is encompassed by his enemies—mist and darkness,—shorn of his rays, and deprived of all his power and glory,—and of his final triumph over his enemies when

his strength returns in Spring. See *The Bible for Young People*, by Drs. Oort, Hooykaas, and Kuenen (Eng. trans. Lond. 1873-78); and Goldziher's *Hebrew Mythology* (Eng. trans. Lond. 1877).

Samuel (Heb. *Shemuel*, 'name of God,' 'placed by God,' or (1 S. i. 20) 'heard of God') was the son of Elkanah and Hannah. His father was a Levite (1 Chron. vi. 22-28), dwelling in Ephraim, and S. was dedicated as a Nazarite (q. v.) from his birth, and brought up at Shiloh as an attendant on Eli the priest. It is said that he was known to be a seer by all Israel, who listened to the revelations from God that were made to him (1 S. iii. 19-iv. 1a).

The great work of S. consisted in what he accomplished for the religious life of the people. The time was a transition period in the history of Israel, marked by a religious revival and a great political advance. After the sanctuary at Shiloh was broken up by the loss of the ark, which remained at Kirjath-jearim when restored by the Philistines (1 S. iv.-vii. 1), the worship of Jehovah seems to have been neglected, the people being devoted to the worship of Baal and Astarte (vii. 3). But when they had been oppressed by the Philistines other twenty years, an enthusiasm began to grow for the national Deity (vii. 2). S. fanned this flame by telling them that all their disasters were due to their unfaithfulness to Jehovah, who would save them if they would only put their trust in him (vii. 3). That he actually gained his end as soon as he opened his mouth can hardly be reconciled with what we know of the subsequent prevalence of idolatry. The account of the consequences of the defeat of the Philistines at Mizpeh (vii. 13, 14) seems to be contradicted by the subsequent state of affairs (cf. ix. 16, x. 5, xiii. 19-22). But the people themselves were realising more and more that the cause of their weakness was the disorganised state of the tribes, and that the only hope of their being able to maintain their national existence among the surrounding nations lay in becoming united under one head. S., despising all statecraft, fought against this tendency, and maintained that the only road to prosperity was religious reformation, and zeal for the worship of Jehovah. Himself a Prophet (q. v.) and a Nazarite, he contributed greatly to the institution of the 'Schools of the Prophets,' and urged others to take the vow of the Nazarites. Like a second Moses he upheld the worship of Jehovah, combating all participation in the customs of the neighbouring nations, as well as worship of their deities. See Ewald's *Gesch. d. Volkes Israel* (Eng. trans. Lond. 1869); Kuenen's *Rel. of Israel* (Eng. trans. Lond. 1874-75); *The Bible for Young People* (Eng. trans. Lond. 1873-78).

Samuel, Books of, in the Hebrew Scriptures, form, with the Books of Kings (q. v.), one historical work. This work in the LXX. and the Vulgate is divided into four books called the Books of Kings; in the Hebrew canon it is divided into the Book of S. and the Book of Kings. The twofold division of each into two was only introduced into the printed Hebrew Bibles in the 16th c. The history contained in the B. of S. extends from the birth of Samuel (about B.C. 1150-60) almost to the death of David (about B.C. 1020, see JEWS). There is reason to believe that the original book did not end where it does now, but carried on the history to the death of David, if not to that of Solomon (1 Sam. ii. 27-36, cf. 1 Kings ii. 26, 27; 2 Sam. v. 4, 5, and 1 Sam. xxvii. 6; 2 Sam. vii., cf. 1 Kings), the continuation having been used by the later writer of the Book of Kings. The writer of the B. of S. is altogether unknown. The only probable approximation to a date is after the death of Solomon (as above), and before the destruction of the kingdom of Israel (B.C. 721), to which it makes no reference. In the composition of his work the writer evidently made use of certain written records, as well as oral tradition.—1. There are certain poetical pieces taken from the former: the song (1 Sam. ii. 1-10) put into the mouth of Hannah (cf. v. 5), but which had been composed for some victorious king (cf. xv. 1, 4, 10), 2 Sam. i. 19-27 taken from the Book of Jasher (q. v.), iii. 33, 34, xxii.) which also appears in Psalm xviii., xxiii. 1-7. 2. The difficulty of making 1 Sam. xvii. 1-xviii. 5, in which David appears as a stranger to Saul, correspond with xvi. 14-23, makes it probable that the writer had incorporated a record of David's encounter with Goliath into his narrative. A similar explanation might be given of the correspondence between 1 Sam. xxiii. 19-xxiv. 22 and xxvi., and of 1 Sam. xiv. 47-52, 2 Sam. viii. (cf. x.-xii.) xxi.

15-22, xxiii. 8-39. See Bleek's *Einleitung in d. Alte Test.* (Eng. trans. Lond. 1869).

Samyda'cese is a dicotyledonous natural order consisting of about eighty-five species of trees and shrubs. The type genus *Samyda* belongs to tropical America, *S. suaveolens* of the Brazilian forests being remarkable for its deliciously-scented flowers.

Sana, properly **Sann's**, the capital of Yemen in S.W. Arabia, and the residence of a native Imaum, lies in a beautiful valley within the great Arabian tableland 160 miles N.E. of Mocha (q. v.), and 162 N. of Aden. It has two fine palaces embowered in gardens, adorned with numerous fountains, 20 mosques, and numerous baths and caravanserais. In rainy weather the main street is transformed into a river, and in consequence is provided with a bridge. The merchants of S., among whom are many *Banians*, are very rich, but affect an appearance of poverty to escape spoliation. Coffee, dates, and tobacco are the chief articles of trade. The Jews, who are much despised and very ill-used, form an important part of the population, which is variously estimated at from 20,000 to 40,000.

San Anto'nio, a city of Texas, U.S., on the S. A. river, 120 miles S.W. of Austin by rail, was founded by the Spanish in 1714. It has ten churches, a hospital, a fortress (the Alamo), a fine public park, two daily and four other newspapers. The people are mostly Mexicans, Germans, and Americans, who occupy different quarters of the town. The Roman Catholics predominate, and have here a college (St. Mary's), with 10 professors and 360 students in 1876. The chief manufactures are flour, soap, prepared meat, and beer. S. A. was the scene of the massacre of 150 whites by the Mexicans in 1836. Pop. (1870) 12,256.

San Christ'obal (formerly *Ciudad Real*), capital of the state of Chiapas, Mexico, on the river Tabasquillo, 450 miles S. of the city of Mexico. It was founded in 1528, and was the seat of a bishopric, first filled by the benevolent Las Casas, whence it is sometimes called *Ciudad de las Casas*. It has manufactures of pottery, and of woollen and cotton stuffs, and is the centre of a cattle-raising district. Estimated pop. (1877) 12,000.

Sanchunia'thon, according to Porphyrius (*De Abstin.* ii. 56), the name of a certain ancient Phœnician writer, who wrote a Phœnician history in the Phœnician language, which was translated into Greek in eight books by Philo of Byblos, who lived in the latter half of the 1st c. A.D. Eusebius, who says (*Præp. Ev.* i. 6, x. 11) S. was a native of Berytus, seems to have read Philo's work himself, and states that Porphyrius made great use of it for his work against the Christians, not now extant. Subsequent writers who speak of S. or of this Philo draw their accounts either from Porphyrius or Eusebius. There is no evidence for the existence of S. except the testimony of Philo of Byblos himself, and not only from the circumstances of the case, but especially from the character of the contents of the work, it is now generally held that the so-called translation of S. was forged by Philo himself. Movers supposes that S. (originally *San-Chon-idath*, 'the whole law of Chon') was the title of the sacred books of the Phœnicians, and that Philo availed himself of this name for his imaginary writer. A useful edition of the extant fragments of the so-called S. was published by J. C. Orelli (Leip. 1826). In 1830 Wagenfeld published (at Hannover) a German translation of a Greek MS. found the year before in a Portuguese convent, which purported to be the entire work of Philo, and in 1837 printed at Bremen the original as well; but it is now agreed that it is the work of a later age, and that, curiously enough, Philo the forger has himself also been made the subject of a forgery. See Movers, *Die Phönizier* (2 vols. Breslau, 1840-56), and Baudissin, *Studien zur Semitischen Religionsgeschichte* (Part i. Leip. 1876).

San'croft, William, an English prelate, born at Fresingfield, Suffolk, January 13, 1616, was educated at Bury St. Edmunds and at Emmanuel College, Cambridge, of which he became a Fellow in 1642. In 1660 he was elected University preacher, obtained the rectory of Houghton-le-Spring, and became a prebendary of Durham Cathedral. After various preferments, he rose to the archbishopric of Canterbury in 1677. With six other bishops he petitioned James II. against the declaration of indulgence 1687; and the seven were committed to the Tower. His attitude towards Dissent seems to have been

changed about this time more than once; but when William of Orange decided for a free Parliament and perfect toleration, S. refused to take the oath of allegiance, and retired to his native village, where he died November 24th, 1693. He produced what Macaulay characterises as 'a hideous caricature of Calvinistic theology' under the title of *Fur Prædestinatus, sive Dialogismus inter Quendam Ordinis Prædicantium Calvinistam et Furem ad Laqueum damnatum habitus* (1651). See D'Oyly, *Life of William S.* (2 vols. 1821).

Sanctification, defined in Protestant theology as 'the work of God's free grace, whereby we are renewed in the whole man after the image of God, and are enabled more and more to die unto sin and live unto righteousness,' is distinguished from Justification (q. v.) as follows: Justification is (1) a transient, (2) objective, (3) forensic act, which (4) changes, or declares to be changed, the relation of the sinner to the justice of God, (5) is founded on what Christ has done for us, and (6) is complete and the same in all. S. is (1) a progressive, (2) subjective work, (3) due to the divine efficiency, and (4) involving a change of character; it (5) is the effect of what Christ does in us, and (6) is more complete in some than in others. See Hodge's *Syst. Theol.* (Edinb. 1873).

Sanctuary was a sacred place, such as a temple, in which those who took refuge were safe from violence. There was a S. at most of the important cities of antiquity, of whose privileges people had availed themselves from such remote times that, according to tradition, they were founded by the founders of the cities. Such was the case at Athens, Thebes, and Rome (cf. Livy, i. 8). Other famous sanctuaries were the temples of Apollo at Delphi and Delos (Livy, xxxv. 51), the temple of Diana at Ephesus; and the Jews had their well-known Cities of Refuge (q. v.). Although it was considered a crime of the deepest dye to kill anyone in a S., yet it might be done if the refugee could be got by force or fraud beyond the limits of the privilege (cf. 2 Macc. iv. 24); he might be driven out by fire, or, failing everything else, might be starved to death, provided he was not allowed to breathe his last within the sacred precincts (cf. Thuc. i. 134). Again, although a S. was intended for the protection of the innocent, such as the homicide from the Avenger of Blood, as among the Jews (Num. xxxv.), too often the privilege was abused. Thus Ephesus, through her temple-S., became a nest of robbers (Strabo, xiv. 641). Other temples were filled with insolvent debtors, runaway slaves, and criminals (Tac. *Annal.* iii. 60-63), and the ends of justice were so often defeated that Tiberius Caesar deprived them all of their privileges but the temples of Juno Samia and Æsculapius. The privilege which was thus enjoyed by many temples was transferred to Christian churches. At first the privileged area was confined to the altar and the choir, as it was to the altar of the Jewish tabernacle and temple (Exod. xxi. 14, 1 Kings i. 50, ii. 28, Jos. B. J. iv. 4, 5). Afterwards the nave, and finally the whole enclosure, was included. All persons were secure there till their case was investigated, except public debtors, runaway slaves, Jews, robbers, murderers, and adulterers. This right had been conferred on churches by the Emperor Justinian in the 6th c., but in the 7th c. Pope Boniface V. ordained that no person who had taken refuge in a church should be delivered up; which led to boundless abuse. The right still exists in Italy; and there is yet one S. for debtors in Scotland—the Abbey of Holyrood.

Sanctus (in sacred music), a principal movement in the Mass of the Church of Rome; the 'Holy, Holy, Holy,' sung in the Communion Service of the Church of England.

Sand, the fine debris of crushed or water-worn rocks. As a rule it consists chiefly of quartz, often along with various colouring matters. Shell-sand frequently consists to a very large extent of broken fragments of the shells of molluscs, or of the entire shells of smaller species, along with foraminifera, sponge-spicules, &c. Coral-sand, in tropical countries, is formed of the detritus of coral reefs. Magnetic sand contains magnetic oxide of iron.

Sand, Georges (Armandine Lucile Aurore Dupin, Baronne Dudevant), born at Paris, July 1, 1804, was the granddaughter of Marshal Saxe's illegitimate daughter. Her father, M. Dupin, married her mother, the daughter of a bookseller, just before Aurora's birth, and left to his child the small estate of Nohant, in Berry, where the novelist lived latterly, and

died. In her youth she was surrounded by people who adopted the religion of Voltaire and the ethics of Rousseau. At thirteen she entered a convent, whence in three years she emerged to study philosophy. In 1822, of her own will, but with no real love, she married a M. Dudevant, whom she left in 1831, formally divorced in 1836, and from whom she bought the custody of their two children for £2000. In 1831 she went to Paris with her daughter, dressed in a man's clothes, and sought literary work. Jules Sandeau joined her, and the two produced *La Prima Donna* and *Rose et Blanche* (1831). These appeared in the *Revue de Paris*, the editor of which, Dupuy, asked from Madame Dudevant something entirely her own. The result was *Indiana* (1832), published as the work of G. S.; *Valentine* (1832), and *Lélia* (1833) followed. Thereafter she sought rest in Italy, and took Alfred de Musset as her companion. Some account of her travels was contained in the *Lettres d'un Voyageur* in the *Revue des Deux Mondes* for 1834-36, and a long stay in Venice produced *Metella* (1833), *Leone Leon* (1834), *Mattea* (1835), *Les Maitres Mosaistes* (1837), *La Dernière Aldini* (1837), and *L'Usaque* (1838). These last all relate to Venice; but to the same period belong *Jacques* (1834), *Le Secretaire intime* (1834), *André* (1835), and *Mauprat* (a masterpiece, 1836). In 1838 she passed the winter with Frédéric Chopin in Majorca. Pierre Leroux next impressed her, and under his influence she wrote *Spiridion* (1839), and *Les Sept Cordes de la Lyre* (1840). Her other novels are, *Le Compagnon du Tour de France* (1840), *Pauline* (1840), *La Comtesse de Rudolstadt* (1843), *Teverino* (1843), *Consuelo* (1844), *Horace* (1844), *Jeanne* (1844), *Le Meunier d'Angibault* (1845), *Le Pêché de M. Antoine* (1847), *Lucrezia Floriani* (1847), *François le Champi* (1848), *La Petite Fadette* (1848), *Les Maitres Sonneurs* (1853), *Elle et Lui* (1858; an account of the author's connection with De Musset), *Les Dames Vertes*, *Laure*, *L'Homme de Neige* (1859), *Constance Verrier*, *Flavie* (1860), *Valvèdre*, *Tamaris*, *Antonia*, *La Ville Noire*, *La Famille Germandre* (1861), *Mlle. de la Quintinie* (1863), *Laura* (1864), *La Confession d'une Jeune Fille* (1865), *Cadio* (1868), *Journal d'un Voyageur pendant la Guerre* (1871), *Impressions et Souvenirs* (1873). The Revolution of 1848 interrupted the labour of G. S. for a time. When she had recovered from the loss of hopes the great struggle raised, she turned her attention to the stage, and in addition to a drama called *Cosima*, coldly received in 1840, wrote the following plays:—*Le Roi Attend* (1848), *Claudie* (1851), *Le Mariage de Victorine* (1851), *Le Démon du Foyer* (1852), *Molière* (1853), *Le Pressoir* (1853), *Mauprat* (1853), *Flaminio* (1854), *Lucie* (1856), *Maitre Pavilla* (1855), *Comme il Vous Plaira* (1856), *Françoise* (1856), *Les Beaux Messieurs de Bois-Doré* (1865). G. S. died June 8th, 1876. She is to be compared only with one Frenchwoman, Mme. de Staël, whom she surpasses in imaginative power and rich, flexible style. Each of her novels is an autobiographical fragment, a confession, a body of notes regarding some new experience actually undergone. No woman ever before or since has written with such varied and sustained effect. G. S. has added to the forms of fiction; when her powers seemed exhausted, they proved exhausted only in one direction, and a reserve of mental vigour enabled her to repeat her triumphs by other means. English prudence at one time delighted to picture her as a social virago, who aped the man even in the habit of smoking, and because of her peculiar views on social questions she has been called the Muse of Adultery. Her surroundings and her trials in youth must be studied along with her many faults of judgment and character. Good and bad, her influence on modern French thinking has been immense, scarcely inferior to that of Rousseau in his time, and such as none but sympathetic as well as commanding genius could have acquired. We may believe her when she says that however much she might be decried or blamed she clung to truth. Her somewhat tedious *Histoire de ma Vie* appeared in 1854 (10 vols.), and the *Dernières Pages de G. S.* in 1877. See Sainte-Beuve, *Causeries du Lundi*, Walsh, G. S. (1837), and James, *French Novelists* (1878).

Sand'al (Gr. *sandalon*), a kind of shoe usually consisting of a sole strapped or fastened to the foot. The S. formed of papyrus and palm leaves was worn in ancient Egypt, and several varieties of it, made of wood, leather, or plaited fibres, were used by the Greeks and Romans. It is still worn in the East, in countries bordering on the Mediterranean, and in warm lands generally, where by reason of coolness it is preferred to the boot or ordinary shoe.

Sand'al-wood is the produce of several trees of the genus *Santalum*—the type genus of *Santalaceæ* (q. v.). The commonest kind is obtained from *S. album*, a small evergreen glabrous tree, with opposite ovate leaves, and brownish-purple or blood-red flowers arranged in axillary panicles, followed by a round black berry. It is indigenous in the drier districts of India, also in Timor and Java. The yellowish-brown strongly scented heartwood is used as incense and perfume; for carving and engraving; and being insect-proof, for the manufacture of small cabinets, ladies' work-boxes, &c. S. oil, used as a remedy for gonorrhœa, is obtained by slow distillation from it and the root—the yield being about 2½ per cent. From ancient times this wood has been an important item in the export trade of India to China and Arabia. Yellow S. (*S. Freycenetianum*), the export of which from the Sandwich Islands to China has existed on a large scale since 1778, has similar qualifications to the above, as also S. Yasi of the Fiji group. *C. cygnorum* of S. W. Australia also yields a scented wood. The name red S. (or Red Saunders) has been given to two *Leguminosæ* called *Adenanthera pavonina* and *Pterocarpus Santalinus*, both large trees natives of India. Of the first the hard and durable heartwood, when fresh cut, is of a beautiful coral-red colour; turning purple after exposure, and then resembling rosewood. The bright scarlet remarkably uniform seeds are used as jewellers' weights of four grains; they are also worn as ornaments. The dye obtained from the *Pterocarpus* is either red, crimson, scarlet, purple, or orange, according to the mordants employed.

Sand'arach is a whitish-yellow inflammable resin, not unlike Mastic (q. v.), but brittle, occurring in tear form, and obtained as an exudation of the bark of *Callitris quadrivalvis*, a moderate-sized coniferous tree of Western N. Africa. It is used in making varnish under the name of gum S., and in a powdered state as Pounce (q. v.). The wood of the tree is hard, compact, durable, balsamic, and fragrant. Locally it is employed for superior building purposes, such as floors and ceilings of mosques, being considered indestructible.

Sand'ay or **Sand'a**, one of the largest of the N. isles of the Orkney group, extending from N.E. to S.W. for 12 miles, with an average breadth of 1½ miles. Pop. (1871) 2053.

Sand'bach, a town of Cheshire, England, 26½ miles S.E. of Chester, and 4½ from Crewe by rail. The chief buildings are the town-hall, assembly rooms, parish church (St. Mary's), and the grammar school. It manufactures salt and shoes, and has several silk factories. Pop. (1871) 5259.

Sand-bags, in military operations, are formed of coarse canvas, sometimes tarred. They are filled with earth or sand, and are used behind field-works to strengthen the parapets, and to afford shelter to the soldiery.

Sand-blast, an apparatus invented by Mr. Tilghman, an American, for cutting and abrading the surface of glass, marble, and other hard stones and like substances, by means of a jet of sand directed with great force by the pressure of steam or air at a high velocity. The essential portion of the apparatus consists of a kind of injector tube, into the upper portion of which sand is admitted, air or steam being admitted at a lower part of the tube, whence by its velocity it carries down the sand with great force against the surface to be acted on. The purpose to which the S. has been found principally applicable is the engraving of ornamental patterns on glass by grinding or depolishing the surfaces on which it is allowed to impinge. The parts to be protected against the abrading effect of the blast have simply to be covered with a stencil or a pattern in paper, lace, indiarubber, oil paint, or some similar soft yielding medium, and by a proper working of the blast even tender leaves are found to give sufficient resistance to enable their outlines to be shown on a glass surface. By using very high velocities exceedingly hard substances can be abraded with rapidity. Thus with steam at a pressure of 125 lbs., a cutting effect of 1½ cubic inches in granite, 3 inches in marble, and about 10 inches in soft sandstone per minute was obtained; and with steam of 300 lbs. a hole 1½ in. in diameter was drilled through a block of corundum 1½ in. thick in about twenty-five minutes. A remarkable feature in the operation of the S. is the abrading effect produced by comparatively soft substances thrown powerfully against hard surfaces. Lead shot propelled by 50-lbs. steam has been made to pierce a small hole

through hard quartz; and using steam at 100 lbs. pressure, a jet of sand cut a hole through a steel file $\frac{1}{4}$ in. thick in ten minutes.

Sand-crack, the name applied by veterinarians to a troublesome affection of the horse's hoof. In this lesion the hoof splits or cracks, and when the injury extends to the soft tissues below, great pain and lameness result. The treatment consists in paring the edges of the fissures very carefully, and in using the firing iron. The fissure may also be closed by aid of fine wire formed round the foot. Mild blisters stimulate the growth of new horny material.

Sandeau, Léonard Sylvain Jules, a French novelist, was born at Aubusson, 19th February 1811. He went to Paris to study law, but soon discovered that his taste was for literature. About 1830 he formed an intimacy with Mme. Dudevant (see GEORGES SAND), and the two began to work together on the *Figaro*. The name under which their joint-productions appeared was Jules Sand. In 1834 S. published *Mme. de Sommerville*, the first work that bore his own name. Of his subsequent writings the chief are *Les Revenants* (1836); *Mariana* (1839); *Le Docteur Herbeau* (1841); *Vaillance et Richard* (1843); *Pernand* (1844); *Catherine* (1845); *Valcreuse* (1846); *Mlle. de la Seiglière* (1848); *Madeleine* (1848); *La Chasse au Roman* (1849); *Un Héritage* (1850); *Sacs et Parchemins* (1851); *Le Château de Monsabrey* (1853); *Olivier* (1854); *La Maison de Penarvan* (1858); and *Un Début dans la Magistrature* (1862). He has also written largely for the stage.

Sandemansians. See GLASSITES.

San'derling (*Calidris*), a genus of *Grallatorial* birds belonging to the plover family, and also nearly allied to the snipes. The common S. (*C. arenaria*) breeds in Arctic regions, but in winter is found in W. Europe, N. Africa, S. America, and India. It is a gregarious bird, and appears to live in small flocks. It attains a length of 8 inches, and in winter is of an ashen-grey hue on the upper parts, and white below. The plumage is of a reddish brown, mottled with black in spring.

Sand'hopper (*Talifrus locusta*), an *Amphipodous* crustacean common amongst the sand on all the coasts of Britain. It leaps for a considerable distance from the sand when disturbed by an approaching footstep. As in other *Amphipoda*, the legs are disposed in two series, one directed forwards and the other backwards. There are seven pairs of thoracic limbs, and the three hinder pairs are bent backwards, forming with the last appendage of the body the powerful leaping tail. The S. is the food of many other animals, including shore-living birds.

Sand'hurst, a city of Victoria, on the Melbourne and Echuca Railway, 101 miles N.N.W. of the former place. It is the centre of the important Bendigo (q. v.) goldfield, and has also manufactures of iron and pottery. The houses and public buildings are of stone and brick, and many of them are very handsome. The streets are well paved and lighted with gas, and the water supply is ample. S. returns two members to the colonial Parliament. Pop. (1876) 26,927.

Sand'hurst, The Royal Military College, is at Sandhurst, in Hampshire, 30 miles from London. It was formerly a college for cadets, succeeding a similar institution at Great Marlow in 1812, but since the abolition of purchase it has been used for giving one year's special military training to sub-lieutenants of the cavalry and infantry recently appointed, and to successful candidates in the competitive examinations for commissions. The college terms are from 10th February to 30th July, and from 10th September to 15th December. At the end of the course, after an examination in the field and on paper, those who pass are gazetted to regiments in which there are vacancies for sub-lieutenants. The subjects of examination are the Queen's regulations, military law, elements of tactics, fortification, military topography, and reconnaissance. The institution is under the presidency of the commander-in-chief, and has three professors and twenty-one instructors of various branches. In the year 1877 a further change was introduced into the college, which was thrown open to cadets for the line and cavalry who had passed their preliminary examination before the Civil Service Commissioners. For the college at Sandhurst for the instruction of officers who wish to be placed on the staff, see STAFF-COLLEGE.

Sand'hurst, Sir William Mansfield, Lord, a distinguished British general, and grandson of Sir James Mansfield,

Lord Chief Justice of the Common Pleas. He was born 21st June, 1819, and entered the army from Sandhurst College in 1835. He served through the two Sikh campaigns, and was present in a diplomatic capacity during the Crimean War. On the outbreak of the Mutiny in 1857 he was made chief of the Staff, and took part in all the operations of the Sepoy War. In 1860 he was made commander-in-chief of the Bombay army, and in 1865 commander-in-chief in India. In 1870 he succeeded Lord Strathnairn as Lieutenant-General commanding the forces in Ireland, and was raised to the peerage in 1871. His knowledge of the details of military administration was very great, and it is understood that his advice was of much service to Mr. Gladstone in settling the measure for the abolition of purchase. He died 23d June, 1876.

Sand'Martin (*Hirundinaria*), a species of *Insectorial* birds belonging to the Swallow family (*Hirundinidae*), and named from building its nest in the sandy banks of rivers and in gravel pits. The nest is constructed in the form of galleries leading to an inner chamber, in which the white eggs are laid. The S.-M. is brown above and white below, with a dark-brown band on the chest. It is regarded as the smallest of the British swallows.

San Domin'go. See HAYTI and DOMINICAN REPUBLIC.

San Domin'go (town). See DOMINGO, SAN.

San'domir, a town of Poland, Russia, on the left bank of the river Vistula, 115 miles S. by E. of Warsaw. It has a fine cathedral and four churches. There is large trade in wood and wheat. At S., in 1570, was formed the well-known *Consensus Sandomiriensis* between the Bohemian Brethren and the Lutheran and Reformed Churches; and here also was concluded, in 1702, a convention of August II.'s supporters against Karl XII. of Sweden. Pop. (*St. Petersburg Calendar*, 1878) 4749.

Sand'piper, a name familiarly applied to several species of *Grallatorial* birds, belonging to the snipe family (*Scolopacidae*), and forming the type of a special sub-family included in the group just mentioned under the name *Totamine*. The nostrils are narrow, and the bill grooved. The under toe is long and slender, but barely touches the ground. The bill is slightly curved at the tip in the true S., and the first quill is the longest. The tarsi are covered by narrow scales in front. The genus *Totanus* includes the Redshank, the Green S. (*T. ochropus*), and the Common S. (*T. hypoleuca*). The Redshank (*Totanus calidris*) receives its name from its red legs. It is about 11 inches long. Though found in Britain all the year round, it is also known as a migratory bird, occurring as far south as Asia Minor and India. The Green S. inhabits the southern coasts of Britain, and is fond of marshy districts. It feeds on worms and insects, and attains a length of 9 or 10 inches. The colour is a dull or brownish green above, and white below. The tail is white, banded with dark brown. The Common S. is also named the summer snipe. Its average length is 7 or 8 inches, its colour being greenish brown above, diversified with black, white, and brown, the breast being grey and the under parts white. This bird migrates southwards in October, and arrives in Britain in April or May. The Greenshank (*T. glottis*) derives its name from its olive-green legs. Species of S. belong to the genus *Tringa*, and of these the Purple S. (*T. maritima*), the little S. (*T. minuta*), the *T. canutus*, named the Red S. or Knot (q. v.), are good examples.

Sand'ridge, a town in Victoria, on the N. shore of Hobson's Bay, 2½ miles S. of Melbourne, of which it is the principal port for large vessels. Besides its extensive shipping trade it has several factories. Pop. (1876) 7503.

Sandrocott'us, the Greek form of the Hindu *Chandragupta* ('moon-protected'), the name of a king whose reign is the one certain date in the early history of India. Though himself an adventurer, he founded a kingdom with Palibothra or Patna for its capital, which was strong enough to resist the army of Seleucus, the successor of Alexander the Great. Seleucus began to reign about 312 B.C.; and the story of his ambassador, Megasthenes, at the court of S., which is preserved to us in the pages of Strabo, is the first independent testimony we possess as to primitive Hinduism. It is thought by some that S. was a Buddhist convert, and identical with the celebrated Asoka, whose inscribed pillars are still standing in distant corners of the peninsula.

Sandstone, a rock resulting from compacted and consolidated sand. The grains usually consist for the most part of quartz, and may either cohere by simple pressure, or may be held together by some cementing material—e.g., lime, peroxide of iron, &c. The latter substance imparts a red colour to the rock, while silicate of iron gives a green. The particles may vary in size from that of a pea to the finest powder, and the presence of such minerals as feldspar, hornblende, mica, &c., may impart a distinctive character.

Sandusky, a town of Ohio, U.S., on S. Bay, an inlet of Lake Erie, 61 miles W. of Cleveland by rail, has thirty churches, a high school, three banks, and three newspapers. It is the greatest fresh-fish market in the world, and produces also much wine and timber. There is extensive trade in machinery and coal. Pop. (1876) 18,000.

Sandwich ('the place on the sands'), a town of Kent, England, 98 miles E. of London by rail. In the 11th c. it was described as 'the most famous of all the English ports.' It is now 2 miles distant from the sea. It has three established churches, three dissenting chapels, a grammar-school, and three hospitals. There is some shipbuilding and brewing. S. unites with Deal (q. v.) and Walmer to return two members to Parliament. Pop. (1871) of municipal borough, 3060. S. was probably an important military station under the Romans, and remains of their fortifications still exist. Under the English it was also important, and its possession was several times contested by the Danes. Edward the Confessor incorporated it, and made it one of the Cinque Ports (q. v.).

Sandwich, a well-known refectory consisting of a slice of meat between two slices of bread. It is said that a former Earl of S. commonly took it to lunch, and hence the name. The term S. is now applied to armour-plating made up of two plates of iron with an intervening layer of wood, or *vice versa*.

Sandwich or Hawaiian Islands, a group situated in the N. Pacific, between 18° 50'–22° 20' N. lat., and 154° 53'–160° 15' W. long., 2100 miles from San Francisco and 3400 miles from Japan. They number twelve, of which eight are inhabited, the remainder being little more than large rocks. The total area of the group is 7460 sq. miles, that of Hawaii (q. v.), the largest, being 4850 sq. miles. The other inhabited islands are—Maui, 750 sq. miles; Oahu, 700; Kauai, 680; Molokai, 170; Lanai, 150; Niihau, 110; Kahoolawe, 40. The whole group is of volcanic origin, and coral reefs are numerous only around the more westerly islands, where eruptions have ceased. Hawaii, which has been called 'a huge slag,' contains two immense volcanoes, Mauna Loa (13,760 feet), and Kilauea (3970 feet), whose craters are respectively 6 and 9 miles in circumference, and are constantly active. The eruptions of Mauna Loa have averaged one every nine years since the advent of Europeans, the last occurring in February 1877. Also in Hawaii is the snow-topped extinct volcano of Mauna Kea (13,953 feet), the highest mountain in Polynesia. On the island of Maui is the extinct volcano of Haleakala ('house of the sun'), 10,000 feet high, whose crater is the largest in the world, being 19 miles in circumference. The mountains of the S. I. are frequently cleft by tremendous gorges, whose precipitous sides are clothed with a tangled mass of vegetation, and in some parts the coast is formed of beetling cliffs, 1000 to 2000 feet high, at whose base the sea has hollowed out deep caverns. The N.E. trade-wind blows with great strength on the northern side of the islands for nine months of the year, rendering the climate mild and equable. From December to March, which is the rainy season, southerly winds prevail. The mean annual temperature on the coast is 68° on the windward and 80° on the leeward side of the islands.

Except on the mountain slopes or the bare lava plains of central Hawaii, the soil of the S. I. is fertile and the vegetation abundant, though less varied than in the larger groups of the S. Pacific. The breadfruit, cocoa-nut, banana, and taro are indigenous, and every tropical crop can be successfully reared. At present only sugar and rice are largely cultivated, with coffee to a smaller extent. The indigenous mammals of the S. I. consist of the dog, rat, pig, and a species of bat which flies by day. The native birds, with some exceptions, are not remarkable either for song or plumage, and in fish and insects the islands are also poor as compared with other parts of Polynesia. A lizard is the only reptile found in the group. Sheep, cattle,

and horses thrive well, and are now very numerous. In 1875 there were about 200,000 sheep in the islands, and it was estimated the number might be increased fivefold without encroaching on plantation land.

The inhabitants of the S. I. belong to the Polynesian race (see POLYNESIA), and are tall and well formed, with handsome features and a light-brown complexion. They are light-hearted and brave, passionately fond of athletic exercises, and daring swimmers and riders, but at the same time so indolent that it is found necessary to import Chinese to work the plantations. The immorality of the islanders is as marked as their courage, and is a prime cause of their numbers having decreased from 400,000 in 1778 to 49,000 in 1872. At the census in the latter year, the total pop. of the group, inclusive of half-castes and foreigners, was 56,897. The capital is Honolulu, on the island of Oahu, with whose commerce the foreign trade of the islands is identical. (See HONOLULU.) In 1876 the imports and exports of the S. I. amounted in value to £362,354 and £448,208 respectively.

Though sighted by one or two of the early Spanish navigators, the S. I. were practically discovered on 19th January 1778 by Cook, who was killed by the natives of Hawaii in the following year. He named them the S. I. after the Earl of Sandwich, First Lord of the Admiralty. At that time each island had a king of its own, but in the closing decade of last century Kamehameha I., who has been styled 'The Napoleon of the Pacific,' by force of arms consolidated the group into a single kingdom, which he placed under the protection of George III. in 1810. He died in 1819, and in that and the following year idolatry was abolished, and the idols everywhere destroyed, immediately after which missionaries began their labours in the islands, which are now wholly Christian. In 1840, Kamehameha III. terminated the period of despotic rule by granting a constitution, which has since been much improved. At the present time the king is aided by a Chamber of Nobles and a Chamber of Representatives, which are convoked every two years. The independence of the kingdom was formally declared by Britain and France in 1843, and is now universally recognised. See *History of the Hawaiian or S. I.*, by J. J. Jarves (Lond. 1843); *The Hawaiian Archipelago*, by Isabella J. Bird (Lond. 1875); *An Account of the Polynesian Race*, by Abraham Fornander (vol. i. published in London, 1878).

Sandwort. See ARENARIA.

Sandys, Edwin, a distinguished English prelate, was born at Hawkshead, Lancashire, in 1519. He was educated at St. John's College, Cambridge, where he adopted the tenets of the Reformers. In 1547 he was elected master of St. Catherine's Hall, and in 1553 vice-chancellor of the university. At the instance of the Duke of Northumberland he preached a sermon in favour of Lady Jane Grey, and was consequently imprisoned, but was soon released and fled to the Continent, where he wandered from place to place in great misery until the accession of Elizabeth. He then returned to England, and was consecrated to the sees of Worcester (1559) and London (1570), becoming in 1576 Archbishop of York. He died at Southwell on the 10th of July 1588. He had charge of the Books of Samuel, Kings, and Chronicles in the translation (1565) known as the 'Bishops' Bible.' His second son, **Sir Edwin S.** (1561–1629), endowed a philosophy lectureship at Oxford, and his youngest son, **George S.** (1577–1643), was well known as an Eastern traveller, and as the translator of Ovid's *Metamorphoses* (published 1632). See the Rev. R. Hooper's *Poetical Works of G. S., now first Collected, with Introduction and Notes* (2 vols. Lond. 1872).

San Felipe de Aconcagua, capital of the province of Aconcagua, Chili, is 60 miles N.E. of Valparaiso, with which, as well as with Santiago, it is connected by railway. Rich copper mines are worked in the neighbourhood. Pop. (1875) 9422.

San Felipe de Jativa. See JATIVA.

San Fernan'do, a town of Spain, province of Cadiz, on the Isla de Leon. It is joined to the mainland by a bridge of boats, the Puente Sanzo, and has a marine school and observatory. The Calle Real, above 1 mile in length, is its finest street. Salt, which is abundantly found on the strand, is largely exported. Pop. 15,300.

San Francis'co, the commercial capital of the State of California, and the chief city on the Pacific coast of N. America,

stands on a peninsula 20 miles long by 6 wide, which separates S. F. Bay from the ocean. S. F. is situated about 5 miles from the 'Golden Gate' at the entrance to the bay, which extends nearly 50 miles inland, branching into the two separate bays of Benicia and Suisun. The peninsula was first settled by Europeans in 1776, when a Spanish military and missionary post was established at the *Presidio*, near the Golden Gate. Shortly after, the Franciscan fathers founded the mission of S. F., which is commemorated in the present Mission Street. In 1836 a town called *Yerba Buena* ('good herb') was planned around the mission, but did not flourish. In 1847, when it had 450 inhabitants, the name was changed to S. F. In 1848, almost simultaneously with the cession of California to the United States, gold was discovered, and the city began to increase with unprecedented rapidity. The pop. in 1852 was 34,776, of whom only 5245 were females. When the gold fever began to decline, the great silver mines of Nevada were discovered, and the agricultural capabilities of California began to be developed, so that a rapid growth has been steadily maintained. In 1860 the pop. was 56,000; in 1870, 149,473; in 1876, 301,020, of whom 32,000 were Chinese; and now (1878) the pop. is estimated at 330,000, including over 40,000 Chinese. In 1876 the arrivals by railroad and sea exceeded the departures by 35,326. Only a small portion, chiefly the business district of S. F., is built on level ground, the remainder of the city being situated on a series of hills in some cases so steep as to be almost inaccessible to vehicles. There are two systems of streets divided by the great thoroughfare of Market Street. In it and Kearney, Montgomery, and California Streets, the banks, offices, and especially the hotels, are extremely handsome buildings. The Palace Hotel, in Market Street, is said to be the largest building of its kind in the world. It is seven stories high, covers an area of 2½ acres, and contains, besides six enormous public rooms, 755 bedrooms, with a bathroom attached to every two. On Montgomery or California Street a foot of frontage with about 70 feet of depth now fetches a price of about \$6000. Outside the business portions of the town most of the houses are built of wood, though some of the wealthy residents have very handsome brick houses on Telegraph Hill and along the upper ridge of the city. S. F. is said to be the most cosmopolitan city in the world, the native-born American population being nearly outnumbered by the Chinese, Germans, British, Irish, and other foreign elements. The Chinese have hitherto congregated almost exclusively in their own quarter to the W. of Kearney Street, but recently they have begun to encroach on other sections, several streets E. of Kearney Street being almost entirely surrendered to them. S. F. has 85 churches and about 6 Chinese 'joss-houses,' 69 free schools and many private schools, 84 periodicals, of which 13 are daily and 34 weekly newspapers, 6 theatres, 2 Chinese play-houses, and 18 public libraries. In 1875 there were 553 manufacturing establishments, employing 18,000 men, and producing articles to the value of \$40,000,000 a year. The leading industries are cigar-making, boot and shoe manufacturing, furniture and carriage making, and fruit and meat preserving. In 1877 the export of treasure was £11,548,730, the other exports amounted to £5,998,480, and the imports to £7,117,574. In the same year 520 ships entered, and 612 cleared the port, with an aggregate tonnage of 598,289 and 718,583 tons respectively. There is a United States Mint in S. F., at which, in 1877, \$49,772,000 were coined. A very handsome City Hall is in course of erection, and will be completed about 1880. Only the Southern Railway of California comes into the city, the terminus of the Central Pacific transcontinental Railroad being at Oakland, on the other side of the bay, to which enormous ferryboats convey goods and passengers. The climate of S. F. is very equable, great heat and great cold being alike unknown, though chill fogs are very prevalent at certain seasons of the year.

San Fratell'o, a town in the N. of Sicily, 4½ miles from the mouth of the Fiumara, and 50 miles W.S.W. of Messina. It is a Lombard colony, and dates from the time of Adelaide of Montferrat, wife of Roger I., King of Sicily. Pop. (1874) 7489. At the base of the hill on which the town stands is the grotto of San Teodoro, containing numerous fossil bones of different species of mammalia.

Sangaree, a drink of West Indian origin, composed of Madeira wine, sugar, nutmeg, and water.

San'gerhausen, a town of Prussian Saxony, at the foot of the Harz Mountains, 12 miles W.S.W. of Eisleben by rail. It has two castles and five churches, and has manufactures of leather, saltpetre, and shoes, besides copper-smelting and weaving. Pop. (1875) 8474.

San'gha ('society'), the name of the monastic order or congregation of mendicants founded by Gautama Buddha, which exists to the present day as the nucleus of the Buddhist religion wherever that religion is professed. See BUDDHISM.

Sangir Islands, a group fifty in number, lying between the Celebes and Philippines, and belonging to the Dutch residency of Menado, in the Celebes. The total area is about 290 sq. miles, and the pop. 30,000. The largest islands are Great Sangir, Tagulandang, and Sijauw. The group is of volcanic formation, and there are three active volcanoes on the larger islands. With a fine climate and a rich soil there is but a slight production of maize, rice, sago, cocoa, sugar, and timber. The Sangirese, a Malay people, are nominally Christian, but are little removed from the savage state.

Sanguinaria is a monotypic genus of *Papaveraceæ* (q. v.). The species is named *S. Canadensis*, and is a small herb with a thick, creeping, underground rhizome. It is of common occurrence in Canada and the United States, where it is known as 'blood root' and 'red puccoon,' names derived from the orange to blood-red colour of the juice of the plant. *S.* is now inserted as officinal in the United States Pharmacopœia, a preparation of the root being used as a stimulant to the liver, as an alternative, and as a local application to fungus growths. At present it is only employed to a trifling extent in Europe. The odour of the root-stock is peculiar and somewhat narcotic; handling it incites sneezing, and the taste is bitterish and acrid. The earliest uses of the root-juice of *S.* was by the Indian warriors to colour their bodies, also for their rude drawings, and for dyeing and staining purposes. It has now been established as a dye agent in America and France.

San'guine, or **Murrey** (Old Fr. *morée*), in heraldry, signifies a dark red or blood colour, and is expressed by lines drawn diagonally and crossed by horizontal lines.

Sanguisor'beæ is a sub-order or tribe of *Rosaceæ* (q. v.), and represented in Europe by the genera *Agrimonia* (q. v.), *Alchemilla* (see LADY'S MANTLE), and *Poterium*, including *Sanguisorba* (see BURNET); and in temperate S. America and Australia by *Acana*. An infusion of the leaves of *A. sanguisorba* serves in New Zealand as a tea and as a medicine.

Sanhedrim or **Sanhedrin** (Heb., from Gr. *synedrion*, as it is called in the New Testament. Matt. v. 22, &c., from *syn*, 'together,' and *hedra*, 'a sitting') was the supreme council of the Jewish nation at the time of Christ, although there was a distinction between the Great or metropolitan S. and the Small or provincial ones.

I. The Great S. was the highest ecclesiastical and civil tribunal, and was composed of seventy-one or seventy-two members, representing three classes of the nation. 1. The priests were represented by their chiefs, the 'chief priests' (Matt. xxvii. 1), probably twenty-four in number. 2. The people generally were represented by the 'elders' (Matt. xvi. 21), 'elders or rulers of the people' (Luke xxiii. 13, xxiv. 20; Acts iv. 5, 8), also numbering twenty-four (cf. Rev. iv. 4). 3. The literary laity were represented by the 'scribes' or 'lawyers,' as interpreters of the law in ecclesiastical and civil matters (Matt. xxvi. 3, 57, 59), who numbered probably twenty-two. The council was presided over by a *nasi* (Heb., 'prince,' 'patriarch') and a vice-president, who were elected by the council out of their number. The qualifications required in members of the S. were very numerous. They had to be both physically and morally without blemish, to be married and fathers, to be middle-aged, tall, good-looking, wealthy, learned—both in the divine law and in different branches of science—to know several languages, so as not to need an interpreter, and to have been members successively of the Small S. in their native town and of the two in Jerusalem.

II. The Small S. consisted of twenty-three members appointed by the Great S., and a president. A court of this kind existed in every town or village which had not less than 120 representative men, and two in Jerusalem. According to the oldest

tradition the S. was founded by Moses (Num. xi. 16-24; Jer. Targ. Ex. xv. 27; Jer. xxvi. 8, 16; Ezek. viii. 11). But according to the best authorities it developed itself from the Great Synagogue during the Greek dominion in Palestine. Josephus does not mention it till the conquest of Palestine by Pompey (a. c. 63), but it could not have been a new thing if it had the power immediately after to summon Herod before it (*Ant.* xiv. 9, 4). It seems to be described also in 2 Chron. xix. 8-11, which was probably written about the beginning of the 2d c. B.C.

After the destruction of Jerusalem the seat of the S. was transferred successively to Jabne (68-80), to Usha (80-116), and back again to Jabne and Usha (116-140), to Shafran (140-163), to Beth-Shearim and Sapphoris (163-193), and finally to Tiberias (193), where it became extinct with the execution of Gamaliel VI., the last nasi (425). See Ginsburg in *Kitto's Cyclo. of Bib. Lit.* (3d ed. Edin. 1876).

Sanitary Authorities and Sanitary Districts. See LOCAL AUTHORITY.

Sanitary Inspector. In the United Kingdom, the appointment of a S. I. is obligatory both for urban and rural authorities. Under the English Act, if the authority pay the S. I. the whole of his salary, he may be under the entire control of the sanitary authority, and be removable at their pleasure; but if, on the other hand, any portion of his salary be paid by Government, the appointment cannot be made without the consent of the Local Government Board, nor can he be dismissed within the period for which he is engaged without the consent of the Board. The sanitary authorities, in either case, control the duties and salary of the S. I.

The following are the principal duties of the S. I. as laid down by the Local Government Board:—The systematic inspection of the district in respect of the nuisances therein existing and that require abatement; the investigation of alleged nuisances or breach of bye-laws or regulations; reporting to the sanitary authorities any noxious or offensive businesses, trades, or manufactories established within the district, and the breach or non-observance of bye-laws or regulations; reporting damage done to any public works, and also any case of wilful or negligent waste of water, or any fouling by gas, filth, or otherwise, of water used for domestic purposes; the inspection of premises used for the sale of food, to ascertain if anything is exposed for sale unfit for such food; the procuring of samples of food or drink suspected to be adulterated, and submitting them for analysis. Upon receiving a certificate that the articles of food, or drink, or drugs are adulterated, he must cause a complaint to be made, and take the other proceedings prescribed by the Act (Sale of Food and Drugs Act, 1875); he shall give immediate notice to the medical officer of health of the occurrence within his district of any contagious, infectious, or epidemic disease of a dangerous character; and whenever it appears to him that the intervention of such officer is necessary in consequence of the existence of any nuisance injurious to health, or of any overcrowding in a house, he shall forthwith inform the medical officer thereof, &c. The Local Government Board does not deem it desirable that the offices of relieving officer and S. I. should be held by one and the same person, nor may the superintendent of police be S. I.; but in certain small towns or districts such public posts as surveyor, vaccination-officer, inspector of weights and measures, may be united with advantage. The duties of the S. I., more especially in large cities, are of the highest importance; and as it is impossible for all of them to be discharged by any single individual, assistant inspectors are employed, and to each a special department is assigned, such as inspector of food, epidemic inspector, &c.

Sanitary Science, sometimes called Preventive Medicine, State Medicine, Hygiene, and Public Health, has been variously defined by different authors. Dr. Mapother, in his *Lectures on Public Health*, describes this science as 'an application of the laws of physiology and general pathology to the maintenance of the health and life of communities, by means of those agencies which are in common and constant use.' Perhaps it may be more comprehensively defined as follows: 'An application of the laws of physiology and general pathology to the maintenance of the health of the human species, and to its development in the greatest perfection.'

S. S. is naturally divided into public and private; private

when it relates to the individual, commonly called Hygiene (q. v.); and public when it deals with communities, commonly called Public Health, or S. S. Regarding S. S. Dr. Guy says, in his *Lectures on Public Health*:—'It has to do with persons of every rank, of both sexes, of every age. It takes cognisance of the places and houses in which they live; of their occupation and modes of life; of the food they eat, the water they drink; and the air they breathe. It follows the child to the school; the labourer and artisan into the field, the mine, the factory, the workshop; the sick man into the hospital; the pauper into the workhouse; the lunatic into the asylum; the thief to the prison. It is with the sailor in his ship, the soldier in his barrack; and it accompanies the emigrant to his home beyond the seas. To all these it makes application of a knowledge remarkable for its amount, and the great variety of sources whence it is derived. To physiology and medicine it is indebted for what it knows of health and disease; it levies large contributions on chemistry, geology, and meteorology; it co-operates with the architect and engineer; its work commends itself to the moralist and divine.' This department of medical science has been cultivated, more or less, from the most remote times; and the fact of its having had a prominent position in the Mosaic code of laws, the ancient medical literature of the Hindus, the Chinese, and the Egyptians, shows that S. S. must have been regarded as a most important means for the independent existence of communities, even in the early dawn of civilisation. In ancient Greece, streams were sufficiently numerous to supply the cities with water, and they were frequently converted into public fountains by the formation of a head for their waters, and the erection of an ornamental superstructure. The inhabitants of Rome, however, were not so favourably circumstanced, and they had doubtless, for a long time, to depend upon the water of the Tiber, and to wells sunk within the city, for their water supply; but the water obtained from these sources was in course of time found to be unwholesome and deficient in quantity. The Aqueduct (q. v.) is mentioned by Strabo as among the structures neglected by the Greeks, and first brought into use by the Romans in order to bring pure water from the hills which surround the Campagna. In the 4th c. of the Christian era, the aqueducts of Rome amounted to fourteen, the length of the longest being nearly 59 miles, and some of its arches 109 feet high. Rome was also intersected with numerous sewers, some of which, especially the Cloaca Maxima (q. v.), were of gigantic size. The sewers were constantly flushed by the superfluous waters of the aqueducts. There was a distinct administration of the sewers, which was entrusted, under the republic, to the censors, and under the empire to particular officers appointed for that purpose, called *cloacarium curatores*, who employed condemned criminals in cleansing and repairing them. Under the empire, state physicians were appointed, who held the title of *archiatus*, the first being Andromachus, physician to Nero. In later times, the order appears to have been divided into two classes, the *archiatri* of the palace and those of the people. The mode of election of the *archiatri populares* is described in the Theodosian and Justinian codes. In the largest towns there were ten *archiatri*, one to each district or subdivision; seven in towns of the second order; and five in the smaller ones; and in some respects the duties of these physicians seem to have been identical with those of our medical officers of health. In ancient Rome we have the best example of a large city possessed of an abundant and pure water supply, and well sewered; some of the sewers being of such superior construction that they serve their original purpose even to the present day.

From the downfall of the Roman Empire until very recent times, S. S. made no advances in Europe, but remained a dead letter. When the empire was overrun by successive hordes of barbarians, pillage and destruction were the order of the day. The aqueducts and sewers of Rome were destroyed, and allowed to remain in a state of disrepair, the salubrity of the place being completely vitiated. For many succeeding centuries, the various European states were almost exclusively employed in offensive and defensive wars, the only honourable occupation being that of arms. The cities were constructed with a view to defence alone; the streets and alleys were narrow and crooked; the houses were of the most vicious construction, and many had damp, underground apartments; no provision was made for potable water, except by the digging of deep wells to supply the population during a time of siege; most

of the principal towns were surrounded with walls and moats; there were no public arrangements for the removal of filth from courts, alleys, and streets, and personal cleanliness was unknown. Even in the 16th c., the filth and wretchedness of the English habitations were almost indescribable. An eye-witness says, 'The floors of the houses are generally made of nothing but loam, and are strewn with rushes which, being constantly put on fresh, without a removal of the old, remain lying there, in some cases for twenty years, with fish bones, broken victuals, and other filth underneath, and impregnated with the urine of dogs and men.' Macaulay in his celebrated chapter on 'The State of England in 1685,' says that at that time meat, though cheaper than in former years, was still so dear that hundreds and thousands of families scarcely knew the taste of it; that bread such as is now given to the inmates of workhouses was then seldom seen even on the trencher of a yeoman or of a shopkeeper, and that the great majority of the natives lived almost entirely on rye, barley, and oats. Soap was rarely used except by the wealthy; linen was so highly priced that it was beyond the reach of the lower classes, who, from their extreme indigence, lived in an utterly miserable condition and in a state of Scythian filth. The ministers of religion were also opposed to all measures of public and private hygiene, and the people were taught that the highest virtue consisted in mortifying the body, saintliness of character and filthiness of home and person being indissolubly associated. S. S. was thus utterly disregarded during the early and middle ages, as it was supposed to unfit man both for this world and that which is to come.'

The inevitable consequences of such insanitary modes of living at length appeared, and Europe was visited by a series of destructive plagues in the 14th, 15th, and 16th centuries such as had probably never before been experienced by the human race. Towards the close of 1347, four ships full of plague-patients returned from the Levant to Genoa, and introduced the Oriental plague, or as it was popularly termed the Black Death, into Italy. In 1348 it broke out at Avignon, and in the course of a few years it spread over the whole of Europe, devastating even Iceland and Greenland. It has been calculated that Europe lost at least a fourth of its population, and 25,000,000 of its inhabitants fell victims to the black death within three years. See BLACK DEATH. The Medical Faculty of Paris accounted for the cause of the plague as follows:—'It is known that in India, and the vicinity of the Great Sea, the constellations which combated the rays of the sun and the warmth of the heavenly fire, exerted their powers especially against that sea, and struggled violently with its waters. These vapours alternately rose and fell for twenty-eight days; but, at last, sun and fire acted so powerfully upon the sea, that they attracted a great portion of it to themselves, and the waters of the ocean arose in the form of vapour; thereby the waters were in some parts so corrupted that the fish which they contained died. These corrupted waters, however, the heat of the sun could not consume, neither could other wholesome water, hail, or snow, or dew, originate therefrom. On the contrary, this vapour spread itself through the air, in many places on the earth, and enveloped them in a fog. Such was the case all over Arabia, in a part of India, in Crete, in the plains and valleys of Macedonia, in Hungary, Albania, and Sicily. Should the same things occur in Sardinia, not a man will be left alive; and the like will continue so long as the sun remains in the sign of Leo, on all the islands and adjoining countries to which this corrupted sea-wind extends, or has already extended from India. If the inhabitants of these parts do not adhere to the following or similar means and precepts, we announce to them inevitable death, except the grace of Christ preserve their lives.' Such was the state of S. S. at the close of the 14th c. Public opinion, however, was directed to the Jews as the cause of the great mortality, and they were accused of poisoning the public wells. It never seems to have occurred to the Faculty of Paris, or to the populace, that their wells were capable of being poisoned by soakage from the streets, alleys, and courts of their cities, saturated with the filth of centuries, and that every city in Europe, from the total neglect of every sanitary precaution, was a perfect hotbed for any epidemic disease which might be introduced. At about this period several contagious diseases seem to have been developed *de novo*.

When Europe recovered from the shock of this great calamity and began to reflect on the events which had transpired, it became evident that contagion had much to do with the spread

of the disease, and that cities might be protected by isolation. On the 17th January 1374, Bernabo Visconti of Milan issued the first regulations regarding a vigorous barricade against the plague. Every plague patient was to be taken out of the city into the field, there to die or to recover. Those who attended upon a plague patient were to remain apart for ten days before they again associated with anybody. The priests were to examine the diseased and point out to special commissioners the persons infected, under the punishment of the confiscation of their goods and of being burned alive. Whoever imported the plague, the State condemned his goods to confiscation. Finally, none except those who were appointed for that purpose were to attend plague patients, under penalty of death and confiscation. When the plague returned in 1383, Bernabo forbade the admission of people from infected districts. Disinfection was not altogether neglected in these days, for we find that Giovanni Visconti, in the year 1399, when the plague broke out in Italy for the sixteenth time, ordered that 'infected houses were to be ventilated for at least eight or ten days, and purified from noxious vapours by fires and fumigations, with balsamic and aromatic substances.' Straw, rags, and the like were to be burned, and the bedsteads which had been used, set out for four days in the rain or sunshine, so that by means of the one or the other the morbid vapour might be destroyed. No one was to venture to make use of beds or clothes out of infected houses, unless they had been previously washed and dried either at the fire or in the sun.' During the 15th c. the plague broke out seventeen times in different places in Europe, and in the year 1485 a special Council of Health, consisting of three nobles, was established at Venice to devise measures for preventing the entrance of the disease to the Italian cities. Quarantine Laws (q. v.) were framed, and the first lazarettos were established upon islands at some distance from the city, where all strangers coming from places where the existence of plague was suspected were detained. When any case of the disease appeared in the city, the sick and also their families were despatched to the old lazaretto, where they were supplied with provisions and medical attendance. When cured, they were detained for forty days longer in the new lazaretto, situated on another island. Such stringent measures could only be enforced by very extensive powers, so that, in 1504, the power of life and death over those who violated the quarantine regulations was conferred on the Council of Health; and from the year 1585 onwards no appeal was allowed from the sentence of the Council. The quarantine laws of the Venetians were gradually adopted by the other commercial nations of Europe; but epidemic disease, whether of men or cattle, can never be stamped out by quarantine or isolation alone, however stringent the regulations may be, and however efficiently they may be carried out. Insanitary conditions must be removed; air, water, and food must be freed from excremented pollution; for such conditions give to epidemics all their potency. For nearly 600 years after the first invasion of the Black Death, Europe trusted almost solely to her quarantine laws for the arrestment of contagious diseases; but, although these laws have been productive of an immense amount of good, they have signally failed in eradicating epidemics from our midst.

Various other epidemics, obviously depending upon insanitary conditions, ravaged Europe during the Middle Ages. In August 1485, after the fate of England had been decided by the battle of Bosworth, the Sweating Sickness (q. v.) appeared, and followed Henry's victorious army to the capital of the kingdom. 'Richmond's army was composed of wandering freebooters, "*vile landsnechte*," as they were called in Germany, who assembled under his banner at Havre; sharpshooters formed under Louis XI., who recklessly pillaged Normandy, and whom Charles VIII. gladly made over to Henry, in order to free his own territories from so great a scourge. This army may not have been worse than others of the same period, but cooped up as they were for a whole week in dirty ships, they doubtless carried about with them all the material for germinating the seeds of a pestilential disorder which broke out soon after on the banks of the Severn, and in the camp at Litchfield' (Hecker). The last epidemic began at Shrewsbury in 1551, and it spread with such rapidity and severity that within a few days 960 of the inhabitants died. Kaye, or Caius, a physician of that time, describes the disease, and ascribes it chiefly to a poisoned condition of the atmosphere. 'Noxious exhalations from dung-pits, stagnant waters, swamps, impure canals, and the odour of foul rushes, which were in general use in the dwellings of England, together

with all kinds of offensive rubbish, seemed not a little to contribute to it; and it was remarked universally that wherever such offensive odours prevailed, the sweating sickness appeared more malignant.' The mortality throughout the kingdom was so very great that one historian calls it a depopulation.

Notwithstanding the plagues and murderous epidemics of past times, no important additions were made to S. S. beyond the quarantine laws of the 14th c., and it was not till the first great invasion of cholera in 1832 that the public conscience was stirred up. Lamentable as were the fatal results of this and succeeding epidemics of cholera in this country, it must be admitted that no calamity which ever visited a country has been productive of such an amount of good. Official investigations into the sanitary condition of the labouring class of the population, published in 1842, revealed a condition of things of which the public had no conception. The co-relation of filth and disease was clearly established and universally acknowledged, and the consequence has been the reconstruction of the cities of Europe. It soon became evident that legislation was imperatively called for, and the first great and comprehensive measure, the groundwork of sanitary legislation in this country, was passed, viz., the Public Health Act of 1848. Since that date various Public Health Acts (q. v.) have been passed.

The first great impulse to S. S. in this country was due to the labours of Edwin Chadwick, Southwood Smith, Lyon Playfair, William Farr, and Dr. E. A. Parkes, who may be said to have laid the foundations of the science.

Dr. Parkes, in his last work on S. S., or *Public Health*, mentions the following as 'the points which are now specially engaging attention, and which have to be considered both in legislation and in the practical performance of the duties of medical officers of health.'

Condition of open lands, forests, and rivers. The drainage of land has a great effect upon public health, more especially as regards the following diseases; viz., ague, dysentery, enteric fever, cholera, diseases of the lungs, rheumatism, and catarrhal affections. Drainage Operations (q. v.) might, therefore, be undertaken by the State, more especially in wet, water-logged, and malarious districts. Irrigation (q. v.) is also, in many countries, a subject of importance as regards the public health, and the operation of sewage irrigation farms should be under State control. The regulation of forests ought also to be considered a State matter, as the climate of a country is influenced by them. In some cases the partial clearing of forests is advantageous; but it has frequently happened that indiscriminate clearances have been detrimental to the public health. In Germany and France there are laws which restrain public action in this respect. The regulations of rivers, such as embankments, narrowings, deepening, and removal of obstructions, are important as influencing the drainage of large areas, but more especially as regards the Pollution of Rivers (q. v.).

Conditions of Habitations; Considered under the following heads:—(1) Hygienic conditions of cities and towns, with populations over 2000 persons. Every town ought to have either a system of sewers or deep drainage of some kind, so as to facilitate the movement of the ground water, as well as to serve as channels for house water. The ground ought to be secured against every source of excremental pollution by the systematic removal of refuse, and by the paving of all streets and courts. Public Sewers (q. v.) in connection with water-closets should be water-tight. 'Made-soil,' which is usually composed of cinder refuse, road-scrappings, &c., should be well drained, so that air and water may freely pass through it, and it should not be built upon before three or four years after being laid down. Gas-mains should also be perfectly tight, for an escape of gas may be sucked into houses, even from considerable distances. Covering the pathways of streets with paving stones, prevents the evolution of effluvia, and facilitates the cleansing of the surface. The best kind of town roadway for horse and carriage traffic is the wooden pavement laid with asphalt, in a particular way on a prepared basis, as it is durable and easily cleaned both by rain and by washing. Streets should be so formed as to admit of a free current of air to all parts of a town; and in no case should a street be less in width than one and a half times the height of a house. There should be open spaces at the back of the houses; and large open spaces should be provided at intervals. Wide, straight streets are useful both for ventilation and traffic, as well as for a complete system of drainage and the laying of pipes. Regarding

density of population, the general rule may be observed that 'whatever be the size of the houses, the amount of ground not occupied by them, in any given area, should be considerably in excess of the amount actually taken up by houses.' In houses, every room should be ventilated directly on the external air, and should be not less than 9 feet in height, in the smallest houses, and from ten to eleven feet in larger rooms. In the water-closets there should be cross-ventilation into the open air. In a town with sewers and water-closets, a daily supply of not less than twenty-five gallons per head should be provided; but if there are no water-closets, from fourteen to twenty gallons will suffice. The water should be pure, and free from any chance of contamination with excreta, or with refuse matter from habitations. In towns, shallow wells should be forbidden, as it is impossible to secure them from contamination by soakage. Reservoirs should contain from two to three months' supply, and the water should be filtered through sand of about three feet in depth. The greatest care should be taken in thoroughly guarding water-pipes and cisterns from contamination. In all towns the water-service should be at high pressure. A copious supply is also required for public baths, wash-houses, flooding and washing streets, and putting out fires. Dirty house water or slops should be removed by means of sinks and trapped pipes or sewers to an appropriate outfall, where it should be subjected to intermittent filtration and then carried into the nearest stream. The dry refuse of houses, such as cinders and ashes, should be frequently removed, and daily if possible. The solid and liquid excreta, which average respectively about two and a half ounces of solids and forty fluid ounces daily for each person, should not be allowed to soak into the earth or remain near dwellings. In towns of above 10,000 inhabitants either of three plans of removal may be adopted: (1) the dry plan, with frequent removal; (2) the water system; (3) the air or pneumatic system of Captain Liernur. (See article SEWAGE DISPOSAL OF). The cleansing of the surface area of towns is of great importance, as the mud and dirt of towns, and refuse of all kinds, soon decompose and give out effluvia injurious to health, especially in narrow courts and lanes, and in wet, hot weather. The supply of food, including the regulation of cowhouses and bakehouses, has also an important bearing on public health; and the duty of supervision rests on the sanitary authority. Food should be fresh and free from adulteration; slaughter-houses should not be allowed in densely-populated districts. In cowhouses there should be at least 1000 cubic feet of space for each animal, and cleanliness should be enforced. The condition of small cowhouses, and dairies attached to them, requires special attention, as both enteric fever and scarlatina are spread through the medium of milk. Meat so decomposed as to be discoloured and have a putrid smell, as also meat with abscesses and suppurations, should be condemned. The meat from animals dead from the following diseases is dangerous to health: cattle plague, anthrax, small-pox, splenic apoplexy, carbuncular diseases, hog cholera, typhus and scarlet fever. Cysticerci in pork, beef, and mutton give rise to tapeworm in man. Wheat, flour, and bread may be unwholesome from ergot, fungi, and acari, and may be adulterated with alum, or mixed with cheaper grains or mineral matter. Milk may be unwholesome from the presence of blood, pus, casts and fungi, and more especially from the *matrices morbi* of specific diseases. The various adulterations of food are too numerous even to be mentioned in detail. The law permits mixtures to be sold in some cases, if the admixture is stated on a label. The regulation of trades is secured under the Mines, Factories, and Workshops Acts, the object of these Acts being, among other things (such as restriction of labour at certain ages), to provide that the common conditions of health are not violated. Another point is to prevent any of the processes being nuisances, or injurious to the health either of the workpeople or the inhabitants of the surrounding districts. The sale of alcohol, in its various forms, requires regulation if the public health is to be regarded. The arrest of the contagious and infectious diseases is of the greatest importance. The more important of these diseases are, among children, small-pox, scarlet fever, measles, whooping-cough, diphtheria, and enteric fever; among adults, enteric fever, typhus, small-pox, and relapsing fever. Syphilis and gonorrhoea should also be included. The general principles on which the prevention is based are, (1) the recognition of the places of origin or conditions of growth of the morbid agent; (2) the recognition of the means of spread of the agent; and (3)

the early removal of the agency from among the community, so that the risk of spreading may be lessened. When patients suffering from infectious diseases cannot be isolated in private houses, they may be removed by order of the sanitary authority to hospitals. Clothing and bedding should be disinfected in chambers in which a temperature of 240° F. can be reached, or by means of Chemical Disinfectants (q. v.). The disinfection of the excreta, or of discharges from the body, and of the air surrounding the sick, should also be attempted. Disinfection, whatever the mode may be, should be practised at once, and should commence at the bedside of the patient. The disposal of the dead is a matter of great importance as regards health. Mortuary chapels ought to be constructed in all towns and villages, to which all corpses should be removed from the homes of the poor within thirty-six hours after death. Cemeteries should be provided at convenient distances from towns, and they ought to have a dry soil, so that the ground water shall never rise high enough to meet the corpse. Owing to the contamination of air in our cemeteries, no houses should be nearer than 500 feet, and great care should be taken of the drainage to prevent water contamination. Disposal of the dead by cremation, and, in the case of seaboard towns, by burying the body in the sea, has been strongly urged by some as the most appropriate modes.

Hygienic Conditions of Villages.—The problem of rural sanitation is by no means an easy one; for, in many cases, the houses are old, dilapidated, and destitute of proper conveniences. The water supply is, generally, more or less polluted from soakage from the dirty house-water, from ashpits and dunghills. All appliances are, in fact, often wanting. The wells may be guarded, however, by carrying off to a distance all the slop-water by drains of some kind, and by removal of the excreta from the vicinity of wells. This may be effected by a pail system with or without the use of dried earth or charcoal, according to circumstances. Conjoint action may be taken in the procuring, drying, and distributing the earth, and in the removal of the mixed earth and excreta.

Hygienic Conditions of Houses.—In certain cases the Local Authority has power over the interior of a house. Common lodging-houses are registered and inspected, and are subject to certain regulations. In the metropolitan lodging-houses, 240 cubic feet, and in Dublin and many other towns 300 cubic feet, are allowed. Cellar habitations must be in accordance with certain conditions of space, height, window area, &c. In England, proceedings may be taken to abate overcrowding of the inhabitants consisting of more than one family; but there is no legal amount as to air space. In Scotland, the General Improvement and Police Act of 1862 enacts that children under eight years of age shall have 150 cubic feet, and persons over that age 300. The minimum ought to be at least 400 cubic feet. Power may be obtained by the Artizans' Dwelling Act of 1875 to pull down houses that continue to be 'so engrained with disease' that no expenditure of money can remedy them. The following are the chief causes of the unhealthiness of houses: Dampness, arising from a damp soil, water rising in walls, or coming from a leaking roof or blocked water-pipes. Excessive coldness of air from draughts, or from insufficient warming. Impurity of the air, arising from impure air being drawn from the ground or basement into the house, or other impurities outside the house; from the air in the house being contaminated by effluvia from closets and pipes; from products of combustion; from products of respiration and transpiration; and from uncleanness of persons, clothes, walls, floors, and furniture. Impurity of the water, arising from the water becoming impure on the premises, from uncleaned, uncovered cisterns; and from the absorption of foul air from pipes and drains by the surface of the water. Lead may also be taken up. Impurities from uncleanness of the house, arising from the absorption of organic impurities by walls and ceilings, or from the collection of such impurities in the chinks of floors or on the furniture. The great point is to have the house-air pure, so as in no way to injure or depress the functions of respiration.

Vital Statistics (q. v.).—The chief vital statistics bearing upon public health are the determination of the birth-rate; of the death-rate according to sex, age, and disease. The gross death-rate, as calculated on the mean population, is that which is commonly used to indicate the health of a town or district. This general death-rate is calculated on the population, as ascertained positively by the census every ten years, alterations being

made in the intervals by the known yearly rate of increase and decrease, and by approximative corrections for emigration. It is assumed that the health of no community is satisfactory if the general death-rate exceeds 23 per 1000 of population per annum; but the standard rate might be reasonably lowered to 22 or 21. To form a correct estimate of the public health it is necessary to ascertain the mortality according to age and disease. A general high death-rate may be owing entirely to a high infantile death-rate, while adults may be healthy. In our large cities the deaths of children under five years of age frequently constitute half the deaths at all ages, whereas in all England the infantile death-rate may be only one quarter or 25 per cent. of the total deaths, and in healthy districts and in good families it may be much lower than this. It is necessary also to determine the diseases causing the infantile death-rate, the child death-rate, and the adult or general death-rate. The birth-rate should also be considered in connection with the infantile and child death-rate. The relative proportion of the infectious or communicable diseases should be carefully noted, as also all those diseases depending upon preventable causes, or removable unhealthy conditions of atmosphere and mode of life. From vital statistics we learn that, as compared with former periods, the expectation of life is improving in the chief European countries, and that the mean age at death is also greater than formerly, and with each new advance in wise legislation the public health has improved. See *Epidemics of the Middle Ages*, by J. F. C. Hecker, M.D. (1864); *A Handbook of Hygiene*, by Dr. Wilson (1876); *Public Health*, by Dr. Parkes (1876); *Dictionary of Hygiene and Public Health*, by Dr. A. Wynter Blyth (1876); *Manual of Practical Hygiene*, by Dr. Parkes, edited by Dr. De Chaumont (1878). For current sanitary literature see *Sanitary Record*, London; *Sanitary Journal*, Glasgow; *Sanitarian*, New York.

San Jacin'to, Battle of, fought April 21, 1836, on the river S. J., and near the bay of the same name, was the last battle in the Texan War of Independence. In it the Texan forces under General Houston completely defeated the Mexican army under General Santa Anna. The latter was taken prisoner, but liberated on the condition that he should use his influence to secure the recognition of Texan independence.

Sanjak (Turk. 'a standard') is the oldest name of an administrative or governmental division of a Turkish province. The ruler, who has to furnish the sultan with a definite number of troops, was called a S.-Beg, because he was entitled in war to carry a one horse-tail standard. In more recent times several sanjaks were amalgamated to form an eyalet, now a vilayet or pashalik, but they still form subordinate administrative divisions, under the rule of *kaimakams* ('deputy-governors').—S.- or *Chyrka-Sherij* is the name given to the sacred flag of the Prophet, which is preserved in the Serai at Constantinople. It is the oilflame of the Turkish Empire.

San Joaquin, a river of California, U.S., rises in the Sierra Nevada, and after receiving the surplus waters of the Tulare Slough, flows N.W., through the splendid valley of S. J. to the Sacramento. It is 350 miles long, and is navigable for large steamers up to Stockton.

San José, the capital of the Republic of Costa Rica, almost midway between the Caribbean Sea and the Pacific, 15 miles N.W. of Cartago, the ancient capital, and about 50 miles E. of Punta Arenas ('sandy point'), its seaport on the Pacific. A railway is in course of construction from this port to Puerto Limón on the Caribbean Sea, and the portion between Cartago and S. J. is completed. S. J. is the seat of a university, and is the centre of a great coffee-growing district. Estimated pop. (1877) 26,000, of whom a large number are Germans.

San José, a town of the State of California, U.S., in the Santa Clara valley, 50 miles S. of San Francisco by rail. It has 9 churches, 6 newspapers, and 7 public schools, in addition to the state normal school which is situated here. It is the centre of a rich agricultural district, and has considerable trade in wheat, wine, and preserved fruits. Pop. (1870) 9089.

San Juan, capital of the Argentine province of S. J., S. America, on a river of the same name, 660 miles N.W. of Buenos Ayres. It is frequently known as S. J. de la Frontera. Pop. 20,000. The western and northern portions of the province

are traversed by spurs of the Cordillera, and possess a fertile soil and delightful climate. Pop. of the province, 60,000.

San Juan Boundary Question, a dispute between Britain and the United States as to the ownership of the island of San Juan, in the Gulf of Georgia, S. of Vancouver's Island. It was simultaneously occupied by the British and Americans in 1859. The Americans claimed that their boundary, under the treaty of 1846, ran from the Lake of the Woods along 49° N. lat., and only deflected southward through the Canal de Haro and the Straits of Fuca so as to leave Vancouver's Island untouched. Britain, on the other hand, maintained that the boundary line passed through Rosario Straits to the S. of San Juan. The Americans rejected arbitration six different times, but in 1872 the matter was finally referred to the German Emperor, who decided in favour of the American claim.

San Juan del Norte, or Grey Town, the principal seaport of Nicaragua, Central America, on the Atlantic, at the mouth of the River San Juan, 181½ miles from the Pacific coast. See NICARAGUA.

San Juan' de Puerto Rico, the capital of the Spanish W. Indian Island of Puerto Rico, situated on a narrow peninsula off the N. coast, is connected with Caguas, an inland town 23 miles distant, by a good macadamised road. It has a good harbour, a cathedral, a theatre, and extensive fortifications. In 1876 there entered 102 British vessels of 16,605 tons, and cleared 102 of 23,807 tons, the value of exports being £526,345. Estimated pop. (1875) 27,000, some 2000 of whom perished in a nine months' visitation of small-pox (1876).

Sankar-charya, a great Hindu teacher of the Vedanta (q. v.) school of philosophy. He was a native of Malabar, and is supposed to have flourished at the end of the 7th c. It was through his influence that Buddhism was extirpated from India.

Sāṅkhya ('synthetic enumeration'), the second, but perhaps the oldest, of the six Hindu schools of philosophy, said to have been founded by the sage Kapila. Its central principle is *prakṛti*, 'the evolver or producer,' which in combination with the soul is the cause and creator of all things. As developed out of *prakṛti* twenty-three entities are synthetically enumerated. The S. philosophy is thus dualistic in its nature, and leans towards atheism.

Sankt-Ingbert, a small town in the Bavarian Palatinate, 33 miles S.W. of Kaiserslautern by rail, and 7 miles N.E. of Saarbrück. It has great coal-mines and ironworks in its neighbourhood. Pop., with the S.-I. ironworks (755) and the S.-I. Mine (1462), 2½ miles distant, (1875) 9220.

San Lucar De Barrameda, a Spanish seaport in the province of Cadiz, on the left bank and near the mouth of the Guadaiquivir. It carries on an active coast trade, and exports wine and fruits. Pop. 18,130.

San Luis, a province and town of the Argentine Republic. The town, commonly known as S. L. de la Punta, is situated 445 miles W.N.W. of Buenos Ayres, and has a pop. of about 8000; the pop. of the province (1869) was 53,294.

San Luis Potosí, a state in the republic of Mexico, bounded by New Leon, Tamaulipas, Vera Cruz, Queretaro, Guanajuato, and Zacatecas. Area, 27,500 sq. miles; estimated pop. (1877) 476,500. It is traversed by several mountain-ranges, which form plateaus in the N.W., and slope in the S.E. into low plains. The soil is fertile and the climate salubrious. Rich forests of trees exist in the mountains, and precious metals are found, though they are not now wrought. Sheep and cattle rearing are the only occupations of the people.—**S. L. P.**, the capital, is situated on a plateau 6350 feet high, 225 miles N.N.W. of Mexico. It is surrounded with gardens, and is well built. It has a cathedral, five churches, three monasteries, and an aqueduct, and carries on trade with Tampico in wines and woven fabrics. Its manufactures include shoes, hats, and hardware. Pop. (1874) 31,389.

San Marco in La'nis, a town of Southern Italy, in the province of Foggia, on the Gargano, 13 miles E. of San Severo. It has some trade in corn and wine. Pop. (1874) 14,540.

San Marino. See MARINO, SAN.

San Minia' to dei Tedeschi, a town in N. Italy, on the Florence and Leghorn railway, 25 miles W. of the former town, has a fine cathedral dating from the 10th c. Pop. (1874) 16,187.

Sannazaro, Giacompo, an Italian poet, born in Naples, July 28, 1458, lived much in France, and was a favourite of Frederico III. He died at Naples 27th April 1530. His principal work is *Arcadia*, a pastoral medley in verse and prose, which in the course of a century went through sixty editions. A Latin poem, *De Partu Virginis*, acquired for him the name of the Christian Virgil. S.'s other works are, *Sonetti et Canzoni*, *Ecloga VI.*, *Elegiarum Libri III.*, *De Morte Christi ad Mortales Lamentatio*. See Crispo's *Vita di S.* (Nap. 1720).

San Nican'dro Garganico, a town of S. Italy, province of Capitanata, on the Gargano, 26 miles N. of Foggia. It has some trade in wool and grain. Pop. (1874) 7895.

San Nic'olas, or **São Nicolão**, one of the Cape Verd Islands (q. v.).

Sannyási, properly a Hindu of the fourth order, who has renounced the world and lives by mendicancy. But the term is now applied to all sorts of religious beggars, especially to devotees of Siva, who correspond to the Mahomedan fakirs. They wander about the country, or are collected in convents. At the end of the last century they became a terror in Bengal, forming armed bands and ravaging the country.

San Re'mo, a town of N. Italy, province of Porto Maurizio, in a fertile district on the Mediterranean, 31 miles E.N.E. of Nice by rail. Sheltered by a semicircle of hills which attain to 4000 feet, and are nowhere more than 4 miles distant, and enjoying a mean temperature in summer of 73° F. and in winter of 40° F., it has become a favourite resort of invalids. The town is interesting from its antique style of building, and is surrounded by luxuriant lemon and orange orchards and palm-groves. Building speculation reached a climax here in 1876, when villas were let at 10,000 francs. Pop. (1874) 9017.

San Roque, a town of Spain, province of Cadiz, on the Bay of Gibraltar. The cheapness of living and salubrity of the climate attract many English visitors in summer. Fruit and vegetables are produced. Pop. 7619.

San Salvador. See SAO SALVADOR.

San Salvador, the smallest but most densely populated, and next to Costa Rica most advanced of the republics of Central America, is bounded W. by Guatemala, N. and E. by Honduras, and S. by the Pacific Ocean. Area, 9594 sq. miles; pop. (*Gotha Almanach*, 1877) 434,520. Lying along the Pacific for 150 miles, it is occupied by the W. slopes of the Cordillera, and separated from the table-land of Honduras by the valley of the Rio Lempa. A strip of level land, with an average breadth of 15 miles, stretches along the coast, and parallel with this and with the main mass of the Cordillera runs the central plateau of S. S., from 2500 to 3280 feet above the sea, and traversed by a volcanic chain, of which sixteen peaks are still active. In this range the highest summits are San Vincente (7875 feet), and San Miguel (7810 feet). The Rio Lempa (138 miles long) is the largest river. Others are the Rio de Paz, Jiboa, and Sirama or San Miguel. There are two considerable lakes in S. S.; the Lake of Guixar in the N.W. of the state, 80 miles in circumference, which feeds the Rio Lempa, and Lake Zlopango in the centre, 9 miles long by three broad, which has its outlet by the Jiboa. The coast is unbroken, save by the deep bay of Fonseca and that of Jiquilisco. The chief ports are La Union, Libertad, and Acajutla. The soil of S. S. is generally fertile, and in some parts extremely rich, while the climate, though tropical, is tolerably healthy except in the strip along the coast. The chief pursuit is agriculture, as the minerals of the country are now almost unwrought. The chief productions are maize, sugar, coffee, tobacco, indigo, and 'Peruvian balsam,' the latter produced in a coast tract, 30 miles in length from Libertad to Acajutla, known as *Costa de Balsamo*. The inhabitants of S. S., consisting of aboriginal and mixed races, with about 10,000 whites, are the most industrious in Central America. Its railways had a length in 1877 of 36½ miles, and its telegraphs in 1875 of 198 miles. The commerce is chiefly with the United States and Great Britain. The value of imports in 1874 was £430,112; of exports (coffee, hides, caoutchouc, flour, &c.), £679,221 (£1,061,481 in 1877). The President is elected for four years, and there are a Senate of twelve, and a House of Representatives of twenty-four members. The estimated revenue for 1876 amounted to £391,670, and the expenditure to £352,170.

The public debt, largely increased by war with Honduras (1872-73), was £872,645 in 1875.—**S. S.**, capital of the above, is situated on a plain 2100 feet above the sea, at the foot of a volcano of the same name, and connected with its port, La Libertad, by a good road 15 miles in length. It has a beautiful situation and fertile surroundings, but has been repeatedly destroyed by earthquakes, most recently in 1854, after which the surviving inhabitants built a town on a neighbouring site which was called Nueva S. S. The new capital was again partly destroyed by a series of earthquakes, and simultaneous eruptions of the neighbouring Tzalco volcano, which began March 4, and ended March 19, 1873. Pop. 20,000.

Sansanding', a town of Bambarra (q. v.), W. Africa, situated on the Joliba, or Upper Niger, 25 miles N.E. of Sego. It has an active trade in salt, beads, and cotton cloth. Pop. 11,000.

Sansculottes ('without breeches') was the name given during the French Revolution by the aristocrats to the ragged democrats. As republicanism waxed fiercer the term lost its reproach; and at one time, to ensure safety, a profession of sansculottism was necessary.

San Sebastian', a seaport of Spain, and since 1854 the capital of the province of Guipuzcoa, on the Bay of Biscay, 38½ miles E.N.E. of Madrid by rail. It is built on a low peninsula, terminating in a conical rock 660 feet high, on the summit of which stands the fortified castle La Mota, and is flanked E. by the estuary of the Urumea, and W. by the small bay which forms the harbour. The town, which has been mostly rebuilt since the two sieges of 1813, has become one of the most frequented watering-places in Spain. It has a marine school, a commercial school, and an anchor factory. In 1871, its exports (consisting of flour, wine, and preserves) amounted to £72,656; and its imports to £428,664 (one-fourth cotton). In the same year there entered and cleared its port 186 vessels, of 48,378 tons. Pop. (1877) 17,902.

San Severo, a town in the province of Capitanata, S. Italy, 184 miles S. of Ancona and 17 N. of Foggia by rail, lies in a district rich in grain, wine, and tobacco. It was captured and sacked by the French in 1799. Cholera raged here furiously in 1865. Pop. (1876) 16,000.

Sanskrit. (1.) *Language*.—S. (derived from *sam* and *kri*, meaning 'put together, polished,' as opposed to Prakrit, 'the vernacular') is the classical language of the Hindus, and in philological interest the most important of all forms of human speech. It belongs to the Aryan or Indo-European family of languages, which also comprises the Zend, the Greek and Latin, the Celtic, the Teutonic, and the Slavic tongues. All these stand to one another in the relation of sistership, being descended from a common parent, 'who died in giving them birth.' This genealogical connection, now firmly established by the science of comparative philology, has only been ascertained since the knowledge of S. was introduced into Europe at the close of the last century. The peculiar characteristic of S. is that it preserves more abundant traces of the hypothetical primitive type than any other member of the Indo-European group. It is the elder sister, in whose lineaments the likeness of the common ancestor is most easily recognisable, and its own derivatives are to be found in the dialects spoken at the present day throughout the N. of India—Hindi (the language of Hindustán proper or the Upper Gangetic Valley), Bengálí (spoken in Lower Bengal), and Mahráthí and Gujaráthí (spoken in Bombay), all of which are lineally descended from S. in the same manner that Italian, French, and Spanish are descended from Latin. The languages spoken in the S. of the peninsula belong to the Dravidian stock (q. v.), but they contain many words of S. origin, and the character in which they are written has been corrupted from the Nagari (q. v.) alphabet of S. Páli (q. v.), the classical language of Buddhism, and itself an offshoot of S.

The S. language possesses a threefold attraction. Not only did its discovery enable us to unlock the secret chamber of comparative philology, but in itself it presents a study of absorbing interest both for the wealth of the literature that it embalms and also for the unrivalled exuberance of its grammatical forms. Though no longer a spoken language, its meaning has never been a lost secret to be recovered by successful decipherment, like the hieroglyphics of Egypt and the cuneiform inscriptions of Assyria. Its correct interpretation has been kept alive to

the present day by a continuous current of oral and written tradition, handed down by the Bráhmans or Hindu priests, who had a personal interest in preserving the religious and legal doctrines by which they maintained their supremacy over the common people. But, fortunately, S. is not the only sacred language of the Vedas, or religious books. In that case the knowledge of it might readily have passed into oblivion, or lived on only as a superstitious jargon. It is also the repository of law, philosophy, poetry, and science. In the whole field of literature, history alone is wanting. Until the needs of British administration drew attention to the study of the vernaculars, S. was in fact the one written language of India. Considering the voluminous character of S. literature, which equals the remains of either Greece or Rome, it is curious to reflect that its very existence was unknown in Europe until the 18th c. When learned missionaries or members of the civil service reported that a language existed in India as ancient as Hebrew itself, and with a literature that might vie with that of Greece, their statements were at first received with derision. But the epoch was ready to welcome new discoveries; and as the 19th c. dawned, the study of S. by European scholars began, and the foundations of philology were securely laid. The first to introduce S. literature to the western world was Sir William Jones (q. v.), who founded the Asiatic Society at Calcutta in 1784. He was succeeded by Henry Colebrooke (q. v.), whose especial merit it was to collect the materials which subsequent students used. These two eminent Anglo-Indians chiefly concerned themselves with S. literature as a branch of Oriental study. It was reserved for Francis Bopp (q. v.) to fix definitely the position of the S. language in the Aryan family by his *Comparative Grammar* (Berl. 1833). In our own times a superficial acquaintance with the subject has been made the common property of all educated Englishmen through the luminous lectures of Professor Max Muller (q. v.), and the *Original S. Texts* of Dr. John Muir (q. v.). A Chair of S. has now a recognised place in every fully organised university.

Regarded as a language, S. claims attention from the excessive flexibility of its modulations. As opposed to agglutinative languages of the Turanian type, where each word is a root and remains constant even in compounds, S. represents the most highly developed form of the inflexional stage. As Greek to Latin, and as the Greek of Homer to the Greek of the New Testament, so is S. to the other members of the Indo-European family. The possible grammatical changes of every noun and every verb are only limited by the mathematical law of permutations; and each of these changes is classified in S. grammar, and has to be learned by the student. Again, these changes are all formed in accordance with a principle of euphonic orthography, which governs the construction of compounds of inordinate length. In grammar, as in metaphysics, logic, and prosody, the genius of the Hindu mind favours interminable niceties of distinction without apparent difference. And these niceties do not represent corruptions of recent growth, but are the fundamental characteristic of the primitive language.

(2.) *Literature*.—S. literature may be broadly divided into two classes—(1) the religious books of remote antiquity, represented by the Vedas; and (2) the later literature of law, poetry, philosophy, grammar, science, and medicine. This classification, which is based upon chronological evidence, roughly corresponds with the twofold classification made by the Hindus themselves into *sruti* or 'revelation,' and *smṛiti* or 'tradition.' The earliest of the Vedas (q. v.), consisting of *mantras* or hymns of prayer and praise addressed to the *devas* or 'shining ones,' is supposed to have been written between 1500 and 1200 B.C. The later Vedas, viz., the *bráhmanas* or ritualistic precepts, and the *upani-shads* or esoteric doctrines, gradually led the way to the mythical stories of the Puránas (q. v.) and the Tántras (q. v.), upon which the debased polytheistic faith of modern Hinduism (q. v.) rests. Second only in authority to the Vedas come the Dharmasástras or law-books, of which the Code of Menu (q. v.) is the principal and best known. This code is supposed to have been compiled in about the 5th c. B.C. Upon it has been reared the entire superstructure of caste. Closely connected with both religion and law, though later in date, is the system of Bráhmanical philosophy, of which six several schools are enumerated: (1) Nyáya, (2) Vaisesika, (3) Sáukhya, (4) Yoga, (5) Mímánsa, and (6) Vedanta. The historical interest of this system of philosophy depends upon its connection with the rise of Buddhism in India.

More attractive than all these to the Western taste is Sanskrit poetry, which affords a rich harvest alike in epic, dramatic, and lyric art. The two great epic poems, the *Rāmāyana* (q. v.) and the *Mahābhārata* (q. v.), are supposed to have been written about the 3d c. B.C. The earliest S. drama, the *Mrichchhakati*, or 'Clay Cart,' is assigned to the 1st c. B.C. The most popular lyric is the *Gitagovinda* of the poet Jayadeva, who probably lived in the 12th c. A.D. Among the vast remaining heap of S. L. it must suffice to indicate the grammar of Pāṇini (q. v.) and his successors, the astronomy of Aryabhatta, and innumerable treatises on mathematics, music, logic, medicine, and architecture. See, besides the works of Benfey, Goldstücker, Burnouf, and Monier Williams, Lassen's *Indische Alterthumskunde* (4 vols. Bonn, 1847-61), Max Müller's *History of the Ancient Sanscrit Literature* (Lond. 1859), Dr. J. Muir's *Original Sanscrit Texts* (5 vols. 1858-70), Professor H. II. Wilson's *Collected Works* (vols. i.-xi. 1864-70), edited by Rost and Hall, and Philibert Soupe's *Études sur la Littérature Sanscrite* (Par. 1878). The principal manual lexicons are those by Benfey (Lond. 1866) and Monier Williams (1872); the only modern dictionary with any pretension to completeness is the great work of Böhtlingk and Roth (St. Petersburg. 1855-75).

San'ta Anna, a town in the republic of San Salvador, on the Pacific coast of Central America, 32 miles N.W. of San Salvador city. Pop. 12,000.

San'ta Anna Don Antonio López de, a former president of Mexico, was born at Jalapa, February 21, 1798. He fought against his countrymen in the war of independence, but recognised Iturbide as Emperor in June 1822; soon after quarrelled with him, 'pronounced' for a republic in December, and by May 1823 had overthrown the Imperial Government. When Guadalupe Victoria was elected president, S. A. withdrew from public affairs for some years, but in 1828 he reappeared as the supporter of Guerrero in a new contest for the presidency, won great popularity by forcing the Spanish general Barradas to surrender with his whole army at Tampico, September 11, 1829, and in 1833 was himself elected president. On this occasion he came forward as the candidate of the 'liberal' party, then organised for the first time in Mexico, but soon threw over his party and headed a clerical reaction whose success brought about such internal disorders that the Texan colonists declared their independence. In the war that followed S. A. was taken prisoner at the battle of Jacinto, April 21-22, 1836, obtained his freedom in the following year, but lost the favour of his countrymen by negotiating a treaty during his captivity recognising the independence of Texas. His gallant defence of Vera Cruz against the French in 1839 transformed him for the second time into a popular hero, and in 1841 a military revolution made him Dictator, an office which he held till 1844, when he in turn fell before an uprising of the 'liberal' party led by General Herrera. Tried for treason (January 1845) he was sentenced to banishment for ten years, and took up his abode at Havana. When the war between Mexico and the United States broke out, S. A. returned secretly to his country, was again made president by a popular movement, but the disastrous defeats inflicted on him by General Scott during 1847 compelled him to seek safety in flight (1848). In 1853 a revolutionary reaction once more invested him with the authority of Dictator, but within two years he was again a fugitive, again tried for treason, and his vast landed property confiscated. During the French invasion of Mexico he offered his services to General Bazaine, recognised the 'empire' of Maximilian, who made him a 'grand-marshal,' but did not invite him to return to Mexico, and on the collapse of Maximilian's government the aged adventurer proceeded to Vera Cruz with his customary evil designs, but was seized and condemned to death. President Juárez commuted the sentence into banishment for eight years. In 1874 he returned to Mexico, and died at Vera Cruz, June 20, 1876.

San'ta Cathari'na, a province in the S. of Brazil, bounded by the Atlantic and the provinces of Parana and Rio Grande do Sul. Its area is 18,924 sq. miles; and its pop. at the census of 1872 was 159,802. The coast is low, but the interior is mountainous, and is watered by numerous tributaries of the Upper Uruguay. Coal of excellent quality and lead ores are found in the province, and the crops principally cultivated are coffee, sugar, maize, and flax. In the financial year 1875-76 the imports amounted to 579,918 reis, the exports to 306,339.

San'ta Cruz, the capital of the Canaries (q. v.), is situated on the N.E. side of the island of Tenerife. Its harbour, naturally good, has been much improved by the construction of two large moles, and is strongly fortified. The streets of the town are narrow, the houses poor, and the public buildings unimportant. The principal export is cochineal, of which 2,190,998 lbs. were exported from Tenerife during the twelve months ending 30th June 1876, nearly all that quantity being shipped at S. C. Wine is also exported, but to a much less extent than formerly; and potatoes and onions are shipped in considerable quantities to the W. Indies. In 1876, 227 vessels of 98,978 tons entered and cleared the port. Pop. (according to the Minister of the Interior, 1877) 14,482. On 20th April 1657 Admiral Blake destroyed the Spanish fleet, though under the shelter of the batteries of S. C. On 24th July 1797 the place was attacked by Nelson, but he was beaten off.

San'ta Cruz de la Palma, the capital of Palma, one of the Canary Islands. See PALMA.

Santa Cruz Islands are situated in the S. Pacific between 9° 50'—11° S. lat., and 165° 40'—167° E. long. They were discovered in 1570 by the Spanish navigator Mendana, and in 1595 the Spaniards unsuccessfully attempted to found a settlement on them. The group consists of one large island, Santa Cruz, and a number of islets. The former is of volcanic origin, hilly, well-watered, and densely wooded. The inhabitants, who belong to the Melanesian race, are fierce and uncivilised, but not numerous. They have earned for themselves an evil notoriety by the murder of Bishop Patteson in 1871, and that of Commodore Goodenough in 1875.

San'ta Fe, a province and town of the Argentine Republic. 1. The province is bounded on the N. by the Gran Chaco, on the E. by the river Parana, on the S. by the province of Buenos Ayres, and on the W. by the provinces of Cordova and Santiago. Its area is 43,700 sq. miles, and its pop. about 100,000. In 1876 it possessed 39 colonies, or special settlements of foreign immigrants, who numbered 23,500, and cultivated large crops of wheat, besides rearing sheep and cattle in great numbers. The largest town in the province is Rosario (q. v.). 2. The town of S. F. is situated on the navigable river Salado, 12 miles above its confluence with the Parana, and has a considerable transit trade. Pop. 15,000.

San'ta Fe, the capital of the territory of New Mexico, U.S., stands at an altitude of 7044 feet, 210 miles S.W. of the railway terminus of Trinidad. It is the seat of a Catholic archbishop, and its cathedral is a cruciform Byzantine structure commenced in 1870, with a length of 270 feet. There are also 4 Catholic and 2 Protestant churches, the 17th c. Adobe Palace, 6 jobbing houses with an annual sale of \$2,500,000, 2 newspapers, &c. Pop. (1870) 4765.

Santalaceæ is a dicotyledonous order of herbs, shrubs, and trees, with entire exstipulate leaves; small or minute flowers with a 3-5 lobed perianth; stamens also 3-5, and opposite to the perianth lobes; fruit a one-seeded nut or drupe. The species number about 200, and are dispersed over the tropical and temperate regions of the globe, with a greater prominence in the eastern than in the western hemisphere. The most important genera are *Santalum* (see SANDAL-WOOD), *Leptomeria*, confined to Australia, where the berries of the pretty broom-like shrub (*L. Billardieri*) are used for preserves, and in the preparation of cooling acid beverages; and *Thesium*, a genus of about 70 species of slender perennial root-parasites, containing the single British representative of the order.

San'talin is the resinous principle of the colouring matter of *Pterocarpus santalinus* (see SANDAL-WOOD). It is prepared by digesting the rasped wood in alcohol and then precipitating by water. S. is soluble in alkalies. The wood is retained as an article of materia medica, for use as a colouring ingredient in the compound tincture of lavender.

San'ta Margherita Di Rapall'o, a town of N. Italy, province of Genoa, on a small bay, 17½ miles E.S.E. of Genoa by rail. Its inhabitants are industrious, the women being employed in making the lace known as Genoese, and the men in coral-fishing. Pop. (1874) 7188.

San'ta Mari'a di Capua Vet'ere, a town of S. Italy, province of Caserta, situated on the site of the ancient Capua,

3½ miles W. of Caserta by rail. Remains of the ancient amphitheatre, a triumphal arch, and catacombs still exist. Pop. (1874) 17,896.

Santa Marta, a Caribbean port of the United States of Colombia, 108 miles N.E. of Cartagena de las Indias (q. v.). It is fortified, and has an excellent harbour, which in 1876 was entered by 72 vessels of 39,151 tons, and cleared by 72 of 41,802 tons. Pop. 8000.

Santa Mau'ra (the ancient *Leucadia* or *Neritus*), one of the Ionian islands on the W. coast of Greece, in the nomarchy of Corfu, is 21 miles long, and from 5 to 8 broad. Area, 108 miles; pop. (1870) 20,892, estimated (1878) 33,000. The surface is very mountainous and infertile, but vines are cultivated on terraces among the hills. The prevailing rock is limestone, and the consequent whiteness of the cliffs gave rise to the ancient name, and to the modern corruption Ducato, applied to the S.W. promontory, which is 2000 feet high. A well-known legend declares that Sappho threw herself from this rock in the despair of disappointed love, and in ancient times not a few followed her supposed example. S. M. was at one time united with the mainland, but a canal was cut by Corinthian colonists. At present there is a long shallow lagoon, through which, however, a canal has been cut. A large ship-canal has now (1878) been begun. The fort of S. M. stands on the mainland, opposite the nearest part of the island. There are in the island twenty-two schools, including a lyceum. Olive oil is here of excellent quality. A full crop yields about 3000 tons. In 1877, 368 tons were exported to England. Currants were introduced in 1859, and their cultivation is extending. About 2,000,000 lbs. are annually grown, but it is expected that 5,000,000 lbs. will soon be reached. Wine is also exported. Wheat, maize, barley, flax, cotton, and hemp are grown. There are extensive salt-pans, but this industry is at present paralysed. Value of exports (1877) £12,204; value of imports, which are very miscellaneous (1876), £8880; (1877), £12,394. — The capital, also called S. M., has a pop. (estim. 1878) at 5000.

Santander, a prosperous commercial town in the province of the same name on the N. coast of Spain, 316 miles N. of Madrid by rail. It is the seat of a bishop and important courts, and has 3 churches, 2 monasteries, and a theatre. It is elegantly built and the houses are mostly new. There are some mineral springs and a splendid bay with good sea-bathing. S. stands in a rich mining district, and in 1876 exported to England 47,000 tons of iron, to France 6000 tons of iron and zinc, and to Belgium 33,000 tons of zinc. The town also has several breweries and many manufactories of cloth, &c., besides being the chief emporium for wool from Castile and Leon. The value of its extensive exports of wheat and flour was in 1876 as follows—To England £101,461, to France £147,804, to Cuba £525,504. The total value of the exports in 1876 was £985,524, of which Britain took £147,277. The imports in 1876 valued £3,196,910, of which Britain sent £1,017,820. The depth and excellence of the harbour make S. a great seaport. In 1876 there entered 693 ships with a tonnage of 190,669 tons, of which 153, with tonnage of 88,859 tons, were British. In the same year there cleared 405 ships with a tonnage of 174,897 tons, of which 150, with a tonnage of 88,973 tons, were British. These figures are exclusive of a large coasting trade conducted entirely in Spanish bottoms. Pop. (1877), 39,011.

Santarem, a town of Portugal on the Tagus, 18 miles N.W. of Lisbon by rail, stands in a district rich in oranges and oil, has 13 churches, 12 monasteries, and a theological seminary. In the 11th and 12th centuries it was for sometime the capital of a Moorish kingdom, and several contests have taken place here in the present century. Pop. 7820.

Santee, a river of S. Carolina, U.S., formed by the confluence of the Wateree and Congaree. It is 150 miles long, and navigable throughout for steamers. It enters the Atlantic near Charleston.

Santerre, Antoine Joseph, born in Paris March 16, 1752, became a brewer in the Faubourg St.-Antoine, and by his wealth acquired great influence among the lower classes inhabiting that district. He received command of a battalion of the National Guard in 1789, and directed his men in the attack on the Bastille. In February, 1791, he headed the mob which attempted to destroy the château of Vincennes. On July 17th of the same year he figured in the Champ de Mars demonstration against the

500

king, led the populace against the Tuileries, June 20, 1792, presided at a banquet given to the Marseillais, actively exerted himself in the insurrection of August 10, and was created Commander-General of the National Guard. In October he rose to the rank of field-marshal, and in July of the following year became general of division. But, marching against the Vendean Royalists with 20,000 men, he was miserably beaten at Coron, and recalled as an incapable. At Paris he was imprisoned as an Orleanist, but after Robespierre's fall he recovered his liberty. On the 18th of Brumaire Bonaparte heard that he was exciting the people in his quarter, and dared him on pain of death to create any disturbance. As a reward for remaining quiet, S. obtained the honorary rank of brigadier-general. He died in obscurity, February 6, 1809. See Carro, S., *sa Vie, publique et privée* (Par. 1847).

Santia'go, or **São Thia'go**, the largest of the Cape Verd Islands (q. v.). It has an area of 277 sq. miles, with a pop. (in 1871) of 35,804.

Santia'go de Chi'li, the capital of the Republic of Chili, is situated 90 miles E.S.E. of Valparaíso, on the small river Mapocho, in a plain which Darwin pronounces to be the bed of a former inland sea, and at a height of 1840 feet above the sea-level. The surrounding country is exceedingly fertile, the climate delightful, and the views of the not far distant Andes magnificent. The city, which is the seat of an archbishop, and the capital of a province of the same name, dates from 1541, is built in squares, and, with some recent exceptions, the houses are only one storey high, and built round an enclosed garden or meadow. This system, which owes its origin to the frequency of earthquakes, gives S. the appearance, when viewed from a height, of 'an immense park sprinkled with houses.' In the years 1872-75, \$8,080,908 was expended on the erection of private houses, and the streets are clean, well paved, lighted with gas, and traversed by tramways. The Alameda, or public promenade, is nearly 3½ miles long, and planted with four rows of poplars. Of the public buildings, the finest is that occupied by the Mint, President's Palace, and Ministers' offices. The educational institutions are important, and include a university, with a rector, five deans of faculties, and 674 students in 1874, high school (called the *Nacional Institut*), military academy, library, museum, and botanical garden. Several of the churches are very beautiful. By a fire during service in that of La Compañía, on 8th December 1863, 2000 persons, chiefly women, lost their lives. S. exports gold, silver, and lead, and is connected by railway with Valparaíso and the other Chilean towns as far S. as Talcahuano. Pop. (1875) 148,264, of whom 3747 were foreigners.

Santia'go de Compostell'a, a town of Spain, province of La Coruña, on the slopes of M. Pedroso, 26 miles N.N.E. of Carril by rail. It was formerly the capital of Galicia, and is still one of the most interesting towns in Spain from its numerous ancient buildings and its picturesque situation. It has fifteen churches, of which the finest is the huge cathedral of the 11th c., containing the tomb of Saint Jago (James), the patron saint of Spain. Joined to it are the archbishop's palace and a monastery, which, with the cathedral, cover two acres. Most of its former numerous monasteries are now in ruins. S. has two high schools, and a university founded in 1532. The vicinity is rich in wine, while S. produces linen, silk, thread, leather, hats, and paper. Pop. 22,750. S. was one of the most frequented places of pilgrimage in the Middle Ages. The town owes the name 'Compostella' to the custom by which each pilgrim to the shrine of Saint Jago received a certificate, so called, of having successfully completed his pilgrimage.

Santia'go de Cu'ba, formerly the capital of the island of Cuba, on a bay on the S. coast, at the mouth of a river of the same name, 150 miles S. E. of Puerto Principe. It has a spacious and safe harbour, which is sheltered by the surrounding hills, and is a well-built town, with a fine cathedral, but its climate is hot and unhealthy. S. is connected with the mines of El-Cobre, 8½ miles inland, by a railway. Its trade has declined greatly since the breaking out of the Cuban insurrection in 1868. In 1868 it exported 47,000 hogsheads of sugar, 12,847 puncheons of rum, and 8,094,240 lbs. of coffee; in 1876, 14,000 hogsheads of sugar, 5871 puncheons of rum, and 1,210,700 lbs. of coffee. Pop. 30,000.

Sántipur, a town in the district of Nuddea, Bengal, British India, on the left bank of the Bhagirutti, 56 miles N. of

Calcutta. It contained a large cloth factory in the commercial days of the E. India Company, and is still inhabited by many weavers. It is also celebrated for its Sanskrit pundits and an annual religious fair. Pop. (1872) 28,635.

Santley, Charles, an English baritone singer, is a native of Liverpool. He completed his musical education in Italy, and made his first success in English opera as Rhineberg in the original cast of *Lurline* at Covent Garden in 1860. The great range and beauty of his voice, the fluency of his execution, his sympathetic, unaffected style, and his robust and vigorous delivery, at once secured his triumph both as an operatic and concert singer. For several years he was attached to Her Majesty's (Italian) Opera, and by careful study became a singularly picturesque and effective actor. He appeared in 1875 and 1876 in the Carl Rosa English Opera Company, for which he wrote the English version of Isouard's *Joconde*. Success in such varied parts as *Don Giovanni*, Mephistopheles in *Faust*, Danny Mann in the *Lily of Killarney*, and Vanderdecken in the *Flying Dutchman*, attests his versatility on the stage. Apart from opera, S. at present occupies the highest place in his profession. His *Elijah* in particular is unique for beauty of expression and dramatic fire. In the concert room, in simple or ornate songs alike, there is no greater favourite.

Santonin, a crystalline neutral principle, obtained from the *Artemisia santonica*, is said to have been first introduced into medical practice in 1830 by Dr. Alms, and is used almost solely as an anthelmintic in cases of *lumbroid*, or *round worms*. A very curious symptom caused by S., even when given in small doses, is zanthopsia, or 'yellow-seeing.' A deep yellow tint, as if the person were looking through yellow glass, is imparted to everything looked at. In some places the tint is replaced by green, red, or blue. The colour of the urine has first an orange tint, then it becomes yellow or saffron, and sometimes a purplish-red colour, resembling blood. The administration of S. should be followed by that of a brisk cathartic. The dose for an adult is 2 to 4 grains, and $\frac{1}{2}$ to $\frac{1}{4}$ a grain for a child two years old.

Santorin (anc. *Thera*), the southernmost island of the Cyclades, 32 miles S. of Naxos, has an area of 65 sq. miles and a pop. of about 15,000. Of late years an active volcano has broken out in the island. There was a violent eruption in April 1870, and in the same year the capital of the island, also called S., was destroyed by an earthquake. In 1866 a new volcanic island of considerable extent, known as *Aphrossa*, was thrown up in its neighbourhood. Remains of very ancient buildings have recently been excavated.

Santos, the chief seaport of the Brazilian province of São Paulo (q. v.), is built on an island, and has an excellent harbour, with an arsenal and fortifications. The site of the town is low and swampy, and yellow fever is frequently epidemic. S. has a large export trade in coffee (44,587 tons in 1876), sugar, cotton (79,427 bales), rum, hides, &c., and enjoys extensive and increasing means of communication by railway with the producing districts of the interior. In 1874 there entered 228 vessels of 137,211 tons, and cleared 215 of 121,211 tons. Pop. 10,000.

São Francisco, a Brazilian river, rises in the Serra do Espinhaço, near the head-waters of the Paraná, and flows successively N., N.N.E., and S.E., in its lower course dividing the provinces of Bahia and Pernambuco, and Sergipe and Alagoas. Of its entire length of 1650 miles, 1100 miles are navigable by steamers, but 170 miles from its mouth navigation is interrupted by the falls of Paulo Affonso. These are seven in number, and the largest is 260 feet high. The Rio de las Velhas, the principal affluent of the S. F. in its upper course, is also navigable for a considerable distance.

Saône (anc. *Arar*; later *Sauconna*), the chief tributary of the Rhône, rises in the Faucelles Mountains, department of the Vosges, and flows in a generally S.S.W. direction through the departments of Haute-S., Côte d'Or, S.-et-Loire, passing the towns of Jussey, Gray, Auxonne, Seurre, Verdun, Châlon, Macon, then due S., forming the boundary between the departments of Rhône and Ain, and finally falls into the Rhône at Lyon, after a course of 282 miles, of which 195 are navigable. From Châlon there is a brisk traffic by river-steamers. The S. is connected with the river-system of the Loire by the Canal du Centre, and with the Seine and Rhine by the Canal of Burgundy and the Rhone-Rhine Canal respectively.

Saône, Haute, a department in the E. of France, bounded N. by the Vosges, E. by Elsass, S. by Doubs and Jura, and W. by Côte d'Or and Haute-Marne. Area, 2062 sq. miles; pop. (1876) 304,052. It is mountainous in the N. and N.E., but the W. and S. are fertile and tolerably cultivated. The department belongs to the basin of the Rhône, and is watered by the Saône and its tributaries, of which the chief is the Vignon. It is traversed by the Paris à Mulhouse Railway. Corn, potatoes, fruits (especially cherries), hemp, and tobacco are cultivated. The extensive pasturages feed large flocks of sheep. Horses, cattle, swine, and bees are also reared. There are also valuable iron mines, and some gold, silver, copper, and manganese. The wine (of mediocre quality) and brandy made in the department amount annually to 7,000,000 gallons. The chief town is Vesoul.

Saône-et-Loire, a department in the S. E. of France, bounded N. by the Côte d'Or, E. by Jura and Ain, S. by Rhone and Loire, and W. by Allier and Nièvre. Area, 3302 sq. miles; pop. (1876) 614,309. It is crossed by several mountain-ranges, watered by the Loire and Saône and their affluents, and though in some parts stony and sandy, is on the whole very fertile, yielding abundance of corn, wine, and wood. It is traversed from N.E. to S.W. by the Canal du Centre, and from N. to S. by the Paris and Lyon Railway. Horses, asses, mules, cattle, sheep, and swine are reared in great numbers. The wines of the department, known as *vins de Mâconnais* and *vins de Châlonnais* are Burgundies of good quality. Its minerals are coal, iron, manganese, &c. It has also numerous mineral springs. Besides agriculture, the inhabitants are largely engaged in mining, and in the manufacture of cotton, silk, and thread goods, earthenware, firearms, steam-engines, &c. The chief town is Mâcon (q. v.).

São Paulo, a province and city of Brazil. The province is bounded by the Atlantic and the provinces of Rio de Janeiro, Minas Geraes, and Parana, and has an area of 90,541 sq. miles, with a pop. in 1872 of 837,354, of whom 156,612 were slaves. It is traversed by a number of mountain-ranges, and possesses great mineral wealth, including coal, iron, mercury, marble, and precious stones. Gold and silver are also found in it, but are not now worked. Cattle and horses are reared in great numbers, and the principal crops grown are sugar, coffee, tobacco, and rice. In the financial year 1875-76 the imports amounted to 5,006,578 reis, the exports to 17,240,562 reis. The city of S. P. is finely situated and well built, and of a railway to connect it with Rio de Janeiro, 142½ miles to the N.E., 108 miles had been opened for traffic in March 1877. S. P. has a college of law, with 11 professors and 340 students. Estimated pop. (1872) 25,000.

São Paulo de Loan'da, the capital of the Portuguese colon, of Angola (q. v.), is situated at the mouth of the river Bengo, and has a fine harbour. The buildings, both public and private, are good, but the streets are unpaved and dirty. A considerable trade is carried on with Britain and Portugal, the exports (palm oil, indiarubber, coffee, wax, gum, &c.) amounting in 1876 to 801,950,348 milreis, and the imports to 1,233,800,677 milreis. A railway is projected to connect Loanda with Amibacca, the centre of the coffee district. The pop. at the last census (1870) was 12,000, of whom only 830 were whites, but in 1876 the native pop. was greatly reduced by famine and smallpox.

São Pedro do Rio Grande do Sul. See RIO GRANDE DO SUL.

São Salvador, Ambasse, or **Ban'za Con'go**, the principal town of Congo, on a plateau 1500 feet above the sea-level, and 120 miles inland from the mouth of the Congo river. In the 15th and 16th centuries, under Portuguese influence, it attained great prosperity, and had Christian kings, a cathedral, and Jesuits' College. With the removal of these and the decline of Portuguese power, the town has relapsed almost into its original condition. Its present pop. is estimated at 20,000.

Sap is the first product of the digestion of the food of plants: it contains the elements of vegetable growth in a dissolved condition. The absorption of nutriment from the soil is the function of the delicate root-hairs and papillæ of the Root (q. v.), the nutriment absorbed consisting chiefly of carbonic acid and nitrogenous compounds dissolved in water. This crude S. is appa-

rently transmitted through the long cells associated with the vascular tissue of the stem and branches to the leaves, passing from one cell to another by a process little understood, but known by the name of *endosmose*. In the leaves is conducted digestion or *assimilation*, a name given to a process which accomplishes the following results:—(1). The chemical decomposition of the oxygenated matter of the sap, the absorption of carbon dioxide, and the liberation of pure oxygen at the ordinary temperature of the air. (2). A counter-operation by which oxygen is absorbed from the atmosphere, and carbon dioxide is exhaled. (3). The transformation of the residue of the crude sap into organised substances, which enter into the composition of the plant. The transformation is effected in the chlorophyll cells of the leaves under the influence of light, and the assimilated or elaborated S. is re-transmitted through the branches and stem to the growing parts of the plant requiring the same, to be there used up (after undergoing a variety of changes included under the term *metastasis*), or to form deposits of reserve material lodged in various parts for future use. See VEGETABLE PHYSIOLOGY.

Sap, in military engineering, is a narrow trench leading from the most advanced parallel towards the besieged fortress. The construction of a S. is extremely dangerous, since the sappers are within easy range of fire of the besieged. Usually the operations are conducted during the night.

Sap'ajou, a term applied to many *Platyrrhine* or New World monkeys belonging to the family *Cebidae*. See CEBUS.

Saph'ir, Moritz Gottlieb, a celebrated German humorist, was born of Jewish parents at Pesth, September 8, 1794. Though at first destined for commerce, he underwent a course of study in the Talmud at Prague, and afterwards dedicated himself to literature, publishing his *Poetische Erstlinge* in 1821. He next went to Vienna, which he left for Berlin in 1825. Here in 1826, besides other humorous writings, he commenced the *Berliner Schnellpost*, and in 1827, also the *Berliner Kurier*, but was obliged in 1829, in consequence of the boldness of his writings, to leave Berlin. He next edited in Munich two similar newspapers. A satire on the king brought him under the ban of the government, and he fled to Paris, but was soon permitted to return, and in 1832 (in which year he became a Lutheran) he was appointed director of the theatre. In 1834 he returned to Vienna, where he established in 1837 the *Humorist*, and in 1850 a *Humoristisch-Satirischen-Volkskalender*. He died at Vienna, September 4, 1858. S. wanted but moral earnestness to have become the Aristophanes of his nation. With great command of wit, a clear intellect, and a fine style, he has left behind no works of enduring worth. The best of his works are *Dumme Briefe* (Munich, 1834); *Humoristische Damenbibliothek* (6 vols. Vien. 1838-41; 10 vols. 1862 et seq.); *Fliegendes Album für ernste und heitere Deklamation* (Leips. 2 parts, 1846; 3d ed. 1858); *Konversationslexikon für Geist, Witze, und Humor* (6 vols. Dresd. 1852; 2d ed. 1862). The collected edition of his *Schriften* has been often published (9th ed. 10 vols., Brunn. 1877 et seq.).

Sapinda'cæ is an extensive order of dicotyledonous trees or shrubs, with alternate or opposite leaves; small flowers, which are generally polygamous; sepals four to five, imbricate, rarely valvate, more or less connate; petals mostly three to five, or none; disc complete, or one-sided; stamens five to ten, generally eight, hypogenous; ovary generally three-celled; ovules one or two in each cell, on axile placentas; fruit various. The order consists of about 700 species, all of which, with the exception of some belonging to the sub-order *Acerineæ*, are non-European, and are for the most part natives of S. America, India, and tropical and S. Africa. *Acerineæ* differs chiefly from restricted S. in its opposite leaves, and its stamens being inserted on, not within, the disc (see MAPLE). In articles GUARANA, HORSE-CHESTNUT, LITCHI, SOAP-BERRY, some important members of this order are detailed, and of others may be mentioned *Schleichera trijuga* of dry forests in India, the wood of which is valuable when strength, hardness, and durability are essentials; *Pteroxylon utile* (see SNEEZE-WOOD), a useful timber-tree of S. Africa; *Cardiospermum Halicacabum*, used as an edible vegetable in the Moluccas, and the root as a laxative, diuretic, demulcent, &c.

Sapodill'a Plum, if completely ripe, is a delicious fruit, the produce of *Achras Sapota* (*Sapotaceæ*) (q. v.), a large evergreen tree, native of Central America and the W. Indies, and cultivated in other hot countries. The timber of the tree is hard, heavy, and very durable; the bark astringent and febrifugal; and the seeds aperient and diuretic. *A. Australis* of Australia furnishes a tolerably good fruit.

Saponification (Lat. *sapo*, 'soap,' and '*facio*, 'I make') is the term given to the chemical process whereby, by the action of alkalis, fats are resolved into glycerine and a salt of the fatty acid (*soap*). In an extended sense, S. applies to the resolution of all ethers and analogous substances into acids and alcohols.

Sap'onin, a substance soluble in water, and closely allied to the Glucosides (q. v.), is a constituent of a considerable number of plants, showing its presence by the readiness with which their juice makes a lather with water. In the sub-order *Sileneæ* of *Caryophyllaceæ*, S. is a prevailing feature; hence we have the genus *Saponaria*, with its English names of Soapwort (q. v.) and fuller's herb. In *Sapindaceæ* its utilised presence has originated the name Soapberry (q. v.) for species of *Sapindus*. Soap-nut and soap-pods are species of *Acacia* (q. v.). S. may be extracted in an amorphous state by boiling alcohol. As used in India for washing certain silk and wool fabrics the soapberry is much preferred to soap—imparting a gloss and dazzling whiteness without injuring the most sensitive colours.

Sapota'cæ is an order of about 300 species of dicotyledonous trees and shrubs, frequently with milky juice; with alternate, entire, exstipulate coriaceous leaves; a 4-8 lobed calyx; a regular hypogenous corolla, having stamens inserted upon its tube, and staminodes often alternating; a 2 or more celled superior ovary containing one ovule in each cell; and a berry or drupe as fruit. They are chiefly natives of tropical America, Africa (a few extending to the Cape), and India. Many yield edible fruits, others supply oily matter, others a valuable milky juice, others very valuable timber, and others act medicinally as tonics, astringents, and febrifuges. In India, *Mimusops Indica* furnishes a hard, very tough wood, used for many purposes. Of *M. Elengi*, the flowers, fruit, seed, and bark are used respectively for decorations and perfumery, for food, for oil, and for medicinal qualities. The W. Indian *Lucuma mammosa* produces an egg-shaped fruit, with a thick pulp resembling quince marmalade—hence its name of 'marmalade tree'; and *L. Caimito*, of Peru, gives a softer and more delicately-flavoured pulp. The dried flowers of *Bassia latifolia* form an important article of food in many parts of India; the ripe and unripe fruit is eaten; an oil is expressed from the seeds, and the oilcake is used as an emetic. Trees belonging to seven genera of this order furnish Guita-Percha (q. v.). For other valuable products see BALATA GUM; BASSIA; MONESIA BARK; SAPODILLA PLUM; SIDEROXYLON; and STAR APPLE.

Sappan' Wood, or **Sapanwood** of commerce, is the barked branch timber of *Cesalpinia* (q. v.) *Sappan*, a large prickly tree of S. India, Burma, and Bengal, with yellow flowers in terminal panicles, pinnate leaves with unequal-sided leaflets, and thick, woody, shining dark-brown pods. It yields a valuable red dye for calico goods, and is largely exported from Calcutta, Madras, Ceylon, and Siam.

Sapper, a private in the Royal Engineers. The sappers and miners in the British army were organised in 1812, and the corps became known as the Royal Engineers in 1859. Sappers (100 of whom go to the war strength of every company of engineers) are recruited from well-educated men who have been brought up, to suitable trades, and on enlistment they go through a course of training in military engineering at Chatham. The number of sappers in 1877-78 was 4251. Their pay is 1s. 1½d. per day.

Sapph'ire is a jewel-stone belonging to the Corundum class, which embraces the ruby, the Oriental amethyst, the Oriental topaz, and the emerald. These are, in common with the S., composed of almost pure alumina, and they differ from each other only in colour, which is due to the presence of minute proportions of iron oxide and other colouring matter. The S. is a beautiful transparent stone of various shades of blue colour; it crystallises as a six-sided prism, and with its allies above enumerated is the hardest of all mineral substances, the diamond alone excepted. Crystals of S. frequently present a star-like

appearance when cut across, and they sometimes have a silky or *chatoyant* lustre. The S. is chiefly obtained in the valleys and watercourses of Ceylon and Pegu; but they are also found, mostly water-worn and fractured, generally throughout the deposits of alluvial gold in New South Wales. It is a very highly prized stone, one of good colour weighing 10 carats being worth 50 guineas, while higher prices have been realised for stones of exceptional colour. Artificial sapphires have been produced by MM. Fremy and Feil, of Paris, by the intense heating of fusible aluminates in presence of silica, whereby silicates were formed and pure alumina separated in the form of fine crystals.

Sappho (Gr. *Sappho*, in her own dialect *Psappho*) was born in Lesbos, probably at Mitylene, where she chiefly lived. The date of her birth is not known, but it must have been shortly before 600 B.C. Her father's name, according to the best authorities, was Scamandronymus; her mother's, probably Cleis. Her husband was Cercolas. Two brothers and a daughter are mentioned in her poems. The events of her life are, with one exception, unknown. On the Parian marbles there is a reference to her flight from Mitylene to Sicily about 600 B.C. We know not when she died, though passages in her poems and the unanimous voice of antiquity tell us that she must have lived to a great age. Her leap from the Leucadian rock is a late invention. Only fragments of S.'s poetry have been preserved, and the loss is one of the greatest in Greek literature; for her sex, her antiquity, and the intrinsic value of what has survived, give a deep interest to her productions. Along with Alcæus (q. v.) she was the founder of lyric poetry; and she wrote, with great grace and tenderness, erotic odes and hymenæals. She is credited also with the invention of the pectis, and of several forms of metre, one of which is hence named the Sapphic. Her odes have been imitated by many classical poets, e.g., Horace. She seems to have presided over a female school of poetry and music at Mitylene. In fact, the position of women there was much more important and independent than anywhere else in Greece, except Sparta. Hence the Athenian comic poets misunderstood the frankness of some of her odes, and ridiculed her as a courtesan. Her character has since been much discussed. In Welcker's *S. von einem herrschenden Vorurtheil befreit* (Göttingen, 1816) she is defended. See also Mahaffy's *Social Life in Greece* (1874). The best editions of her *Fragments* are Neæe's (1827), Schneidewin's (1839), and Bergk's (1866). They are also collected in Bishop Blomfield's *Museum Criticum*, vol. i., and there are translations in most modern languages.

Sapucaia Nut, the trade name for the seed of *Lecythis Zabuzajo*, a large tree of the Brazilian forests. The quality of the kernel is much superior to that of the closely allied Brazil Nut (q. v.). Each 'nut' is about 2 inches long, and half as wide, covered with a longitudinally-furrowed corky shell, and they grow loosely packed in hard, woody fruits, shaped like urns, with a closely-fitting lid at the top, which ultimately drops off and allows the ripe seed to fall. Monkeys are particularly partial to this nut.

Sarabande (Sp. *Zarabanda*), a stately and antique Spanish dance for one performer in three-quarter time, the second beat in each bar being strongly accented. It was much used by the old masters as a movement in suites for the harpsichord.

Saracenic, Moorish, or Arabian Architecture was based upon the styles of the nations subdued by the Mohammedan conquerors in the 7th and 8th centuries, and varies accordingly in different countries, the Mosques (q. v.) in Spain following a Romanesque, as those in Turkey followed a Byzantine type. The addition, however, to all these styles of such features—suggested by Oriental fancy or the wants of Mohammedan worship—as minarets, arabesques, lattice-work, and gorgeous colouring, served to create a novel architecture, which attained its highest development in the Alhambra of Granada and Mosque of Cordova, with their numberless slender columns and horseshoe arches. See Owen Jones' *Plans and Details of the Alhambra* (Lond. 1842).

Saracena, a name variously derived from *Sarah*, the wife of Abraham (Du Cange), the Arabic *saraca*, 'to steal' (Hottinger), and the Arabic *shrah*, 'an uncultivated track' (Forster), but whose true etymology seems to be the Arabic *Sharkeyn*, 'Eastern people,' whence also Saraka, a region or city of Arabia Felix, mentioned by Ptolemy and Stephanus Byzantinus. Menander,

Procopius, Pliny, and others designate as *Sarakēnoi* (Lat. *Saraceni*) either Arabs generally or Beduin Arabs dwelling between the Tigris and Euphrates. In course of time S. became the general title of all Arabs who had embraced Islam, and next in mediæval chronicles an appellation of Mohammedans, irrespective of race, against whom crusades were directed.

Saragossa (Sp. *Zaragoza*), capital of the province of the same name in Arragon, Spain, on the Ebro, 211½ miles N.E. of Madrid, and 227½ W.N.W. of Barcelona, by rail. It stands in a fertile and well-watered plain, among oil and mulberry trees. It has thirty-eight squares, twenty-one churches, five hospitals, one theatre, and twelve nunneries. The river is crossed by a fine old bridge (built 1437), and the town is surrounded by a wall. There are two cathedrals—the Metropolitan church of San Salvador, a Gothic building, and the Nuestra Señora del Pilar, or Cathedral of the Virgin. The university, founded in 1474, once had eighty professors and 1400 students. The Exchange, built in 1557, is a splendid building. The Torre Nueva, a leaning tower, is only second in fame to that of Pisa. There are many institutes, academies, learned societies, and charitable institutions. S. has manufactories of cloth, silk, linen, and some chemicals. The *Salduba* of the native Celtiberians, it was frequently visited by the Phœnicians. The Romans founded a colony here in 25 A. D., called *Cesarea Augusta*, of which the modern name is a corruption. S. was conquered by the Moors in 712, and made a royal residence by them. In 1118 Alphonso I. took it after a long siege, and under him and his successors it greatly declined. In 1808 and 1809 it underwent two most formidable sieges by the French. It was taken by them in 1809 after a most brilliant defence by the citizens under Palafox (q. v.), during which they contested the possession of every house and street. Many valuable archives were then destroyed. Pop. (1877) 67,539.

Saransk, a town of European Russia, government of Pensa, on an affluent of the Sura, 69 miles N.N.E. of Pensa. It has seventeen churches, and is a thriving town with a great annual fair. Pop. (*St. Petersburg Calendar* for 1878) 9369.

Saratoga, Battle of, fought between the British under Burgoyne and the Americans under Gates, on the heights of Saratoga, 12 miles E. of Saratoga Springs (q. v.), on the 7th of October 1777. The result of this battle was that on the 17th the British, to the number of 5752, surrendered with the honours of war, on the condition of being allowed to embark for England, a condition which Congress did not permit to be carried out.

Saratoga Springs, the most fashionable watering-place of the United States, situated in the State of New York, 36 miles N. of Albany, and 186 miles from New York. Its mineral springs, twenty-eight in number, annually attract crowds of visitors, of whom its great hotels can accommodate from 10,000 to 15,000 at a time. Congress Park, a large and elaborately-laid-out pleasure-ground, was completed in 1876, and a handsome town-hall, which cost \$110,000, is used for concerts and entertainments. Saratoga has eight churches and four newspapers. Pop. (1870) 7516. About 4 miles from the town is Saratoga Lake, where the American University boat-races are held. The lake affords a straight course 3 miles in length, where fourteen boats can be rowed abreast.

Sara'tov, a government of Russia, on the W. side of the Volga, bounded N. by the governments of Pensa, Simbirsk, and Orenburg, E. and S. by Astrakhan, W. by Tambov, Voronezh, and the country of the Don Cossacks. Area, 32,614 sq. miles. Pop. (1870) 1,751,268. It is watered by the affluents of the Volga, and by the Choper and Medveditsa, flowing to the Don, which is separated from the Volga by the monotonous wastes of the Volga Hills, occupying a large tract in the S. In the E. there are many lakes, the largest of which is the salt lake of Elton. Of the surface, one-seventh is cultivated land, one-ninth under wood, one-third meadow land. Agriculture and cattle-rearing are the chief occupations of the people. The principal crops are rye, wheat, oats, flax, hemp, and tobacco. The fisheries of the Volga are very productive. Among the inhabitants are a large number of German colonists, originally introduced by Catherine II. (1764-70), whose industry and skill have done much to improve the government.—S., the capital, lies on the right bank of the Volga, 219½ miles E.S.E. of Tambov by rail. It was built in 1591, and has broad

streets, but most of the houses are built of wood. It carries on manufactures of ropes, stockings, tobacco, soap, earthenware, and tiles, and has two iron foundries. Pop. (*St. Petersburg Calendar* for 1878) 85,220.

Sara'wak, an independent province of Borneo, extending for about 400 miles along the western coast from Tanjong Datu in the S. to Tanjong Kidurong in the N., and inland in a north-easterly direction as far as the headwaters of the Rejang river. Area, 28,000 sq. miles; pop. (as estimated by the Rajah's Government, 1876) 222,000, of whom 60,000 were Malays, 90,000 Sea Dyaks, 35,000 Land Dyaks, 30,000 Milanaus, and 7,000 Chinese. Covered for the most part by forests, and traversed by numerous streams and lofty mountain-ranges, S. is singularly rich in minerals, 4,000,000 tons of coal existing, according to an English expert, in a single seam, which might easily be worked. The climate is moist (182 inches of rain in 1876), and the temperature averages 85° F. The exports (sago, quicksilver, gutta-percha, indiarubber, rattans, &c.) amounted (1876) to \$1,433,139; the imports (cloth, tobacco, rice, brass ware, &c.) to \$1,317,665. The present Rajah, a son of the late Sir James Brooke (q. v.), is absolute head of the state, but is assisted by a legislative council of two Europeans and five Malay chiefs. He has a standing army of 200 Dyak Rangers, and the militia consists of some 25,000 men. There are three government schools, and a mission, with the Anglican Bishop of Labuan at its head; and the growing prosperity of S. offers a strong contrast to the anarchy and vice of Borneo proper, piracy and head-hunting having become things of the past, while slavery is being gradually abolished. Kuching, the capital, contains the Rajah's residence, a handsome court-house, a fort (enlarged 1877), and prison, and its estimated pop. was 20,000 in 1876. See G. L. Jacob's *The Rajah of S.* (2 vols. Lond. 1877).

Sar'cina Ventric'uli. This alga was first discovered by Goodsir in 1842, among the matters vomited by a patient. It has also been found in the urine, in the feces, in an abscess of the lung, in the fluid of the ventricles of the brain; in fact, in most parts of the body, and also in the lower animals, and, by Dr. Lowe, in stagnant water. S. V. is of a roundish, quadrangular form, about $\frac{1}{16}$ th to $\frac{1}{8}$ th of a line in diameter, the individuals being generally grouped in cubes of four, sixteen, or sixty-four in the cube, separated by rectangular striae. The appearance of S. V., in vomited matter, is characteristic of an important form of dyspepsia. The amount of fluid matter vomited is always large, and the vomiting generally takes place in the morning, the discharge giving, almost invariably, immediate relief. The matter has a faint acid smell, like that of fermenting wort, and after standing a few hours it becomes covered with a yeast-like froth, and deposits a brown, flaky sediment. Both the froth and deposit contain S. V. in great abundance. The vomit may have an alkaline reaction, but the brown flocculi which contain the S. V. are always intensely acid. The S. V. is generally, but not invariably, accompanied with a great number of oval torulae, and is symptomatic of organic disease by which the stomach is prevented from completely emptying itself. Sulphite of soda given in 20 to 60 grain doses relieves what probably is an almost incurable disorder, by the sulphurous acid being set free in the stomach and destroying the organisms.

Sarcine (from Gr. *sarx*, 'flesh'), ($C_5H_4N_4O$), a constituent base of the flesh of vertebrata, most easily prepared by precipitation from the mother liquor of creatine, which has been boiled with dilute cupric acetate. The cupric oxide present in the precipitate is got rid of by treatment in nitric acid mixed with nitrate of silver, when the nitrate of S. is obtained, which when boiled in an ammoniacal solution of silver nitrate gives a compound of S. and oxide of silver, which is decomposed by sulphureted hydrogen. S. dissolves readily in boiling water, forms crystallisable salts with acids, and crystalline compounds with metallic oxides and other bases.

Sarcolemma, the delicate tissue forming a protecting sheath for the fibres of which *Muscles* (q. v.) are composed.

Sarco'ma (Gr. 'a fleshy excrescence') is a term used by the older surgical writers to designate a fleshy or firm morbid tumour. For a considerable time the term fell into disuse, but it has recently been revived by modern pathologists, especially

the Germans, to designate that class of tumours whose structure presents some resemblance to the rudimentary forms of some natural tissue of the body, such as the adenoid tumours of the mammary and prostate gland, the fibro-plastic tumours of Lebert, and others, such as the myxoma and glioma of Virchow.

Sarcoph'agus (Gr. 'flesh-eater') is the antiquarian name of a coffin or tomb of stone. Such receptacles were at one time frequently made of Assian stone, which came from Assos in Troas, and which was believed to have the property of consuming the body, with the exception of the teeth, in forty days, whence the name S. The oldest known sarcophagi are Egyptian, and have been found in certain of the pyramids. The most famous of these was discovered in 1801, and is now in the British Museum. By the Phœnicians, Persians, and Romans sarcophagi were also used; but in the latter days of the Roman republic, just before the beginning of the Christian era, cremation to a great extent superseded interment. In more modern times stone coffins have not been uncommon for royalty and persons of high rank.

Sard, a deep-brownish red chalcedony, somewhat darker than carnelian, and of a blood-red colour by transmitted light. The *sardonyx*, a beautiful and rare variety of onyx, consists of alternate layers of S. and white chalcedony.

Sardanapa'lus, according to Ctesias and following him Diodorus, was the last king of Assyria. The Greek legend represents him as leading a luxurious effeminate life, until, attacked by a large army under Arbaces, satrap of Media, and Belesys, the Chaldean priest, he suddenly developed into an heroic warrior. Twice he defeated the rebels, but was at length overcome and obliged to shut himself up in Nineveh. Two years he stood the siege, and then, finding resistance hopeless, burned himself, his treasures, and all his womenkind upon a great pile which he had erected. That a weak, effeminate, dissolute monarch should in a moment become transformed into a bold undaunted hero, capable of ending his existence in such a tragic manner, is in itself highly improbable; and that such a monarch existed is very doubtful, especially when the story is viewed in the light which modern research into the cuneiform inscriptions has cast upon the history of Assyria. There would appear, however, to be an element of fact in the Greek account, the name S. being a corruption of Assur-danipal, confounded with Assurbanipal, both of which names occur several times in the two dynasties of Assyria. In the second dynasty, which ended 625 B.C., the last king, Assur-emid-ilani, besieged in Nineveh by Cyaxares the Mede, burned himself in his palace rather than fall into the hands of his foes. In fate he corresponds with the warlike S., and he might easily have been confounded with his father Assur-danipal III., who was a brave and enlightened monarch, and who successfully upheld the dignity of the Assyrian kingdom, which had been consolidated by his predecessor Assur-akh-iddina or Esar-haddon.

Sard'es, or **Sard'is**, anciently one of the chief cities of Asia Minor and capital of Lydia, was situated in a fertile plain at the N. base of Mount Tmolus, on both banks of the river Pactolus, near its junction with the Hermus, and 60 miles E.N.E. of Smyrna. It reached its greatest prosperity under Croesus, the last king of Lydia. On the downfall of the native monarchy it became the residence of the Persian satraps of Western Asia, but after the battle of the Granicus its freedom was restored by Alexander the Great, on whose death it fell to Antigonus and subsequently to the Seleucids of Syria. Under the Romans it continued a rich and flourishing city, and though ruined by an earthquake in the reign of Tiberius, was rebuilt by his orders. It is spoken of by St. John as one of the seven churches of Asia. Captured by the Turks in the 11th c., it was almost entirely destroyed by Timur in the 13th c. Its only remains are magnificent ruins at the village of *Sart*.

Sardha'na, a town in the district of Meerut, N.W. Provinces, British India, 12 miles N.E. of Meerut. Pop. (1872) 12,466. It is celebrated as the former residence of the Begum Sumru, who died in 1836. She founded here a Roman Catholic cathedral and St. John's College for the education of native priests. Her palace, a fine modern house, is well kept up.

Sard'ine is a small fish belonging to the same genus as the herring, and by Gunther it is regarded as a variety of pilchard (*Clupea pilchardus* var. *sardina*) although other authorities set

it down as a distinct species. It is found in vast shoals on the northern coasts of the Mediterranean, and on the Atlantic coasts of Europe, deriving its name from the Mediterranean island Sardinia. The S. has been in repute from very remote times, and since the modern system of preserving the fish in oil in hermetically-sealed tins was adopted, it has become a favourite throughout the world. The oil-curing is thus effected: after careful washing, sprinkling with salt, and removal of heads and intestines, the sardines are spread out to dry. They are then dipped for a short time in a bath of boiling oil, and laid on a grating to permit the oil to drain off. They are next packed into the little oblong tin boxes used for them, the box filled up with hot olive oil of fine quality, and the lid soldered down. The soldered boxes are then exposed to the heat of a steam bath, which causes the sides to bulge out, but they again collapse on cooling. The value of the sardines exported from France averages half a million sterling yearly. The industry is now established in Cornwall, where the smaller and more delicate pilchards are similarly treated and sold as Cornish sardines; and, indeed, a considerable proportion of the French sardines are really sprats, vast shoals of which occur on the E. coast of Scotland, and might with advantage be cured as Scotch sardines.

Sardinia (Ital. *Sardegna*, Fr. *Sardaigne*, Gr. *Sardo*), after Sicily, the largest island in the Mediterranean, lies S. of Corsica, from which it is separated by the Boche di Bonifacio, 7 miles in width. It is 119 miles distant from Africa, and 140 from Italy. Its length from N. to S. is 174 miles; its breadth from E. to W. 70 miles. Area, 9463 sq. miles; pop. (1877) 658,479. S. is surrounded by a number of smaller islands, of which the more important are, on the N., Asinara, La Maddalena, Caprera (q. v.), Tavolara; on the S.W., San Antioco and San Pietro.

Surface, &c.—The island is very mountainous, the general direction of the ranges being from N. to S. The chief ranges are Monti del Gennargentu (*Junua argenti*), of which the highest peaks are Bruncu Spina, 6266 feet, and Suiscia, 6118 feet; and to the N., the Monti di Limbara, with a general elevation of over 4000 feet. From the centre there slopes to the W. coast an elevated table-land, in which is situated the volcanic Monte Ferru, rising in its peak Urtian to 3445 feet; while to the N.W. extend the Gocceano and Bosa, with a maximum height of 4036 feet. In the N.W. corner is a rich plain, terminated by the mountain group La Nurra, which is continued in the island Asinara. In the S.W. part of the island is an extensive plain, the Campidano, stretching from Cagliari to Oristano, and celebrated for its extraordinary fertility. The rivers of S. are unimportant, and many of them entirely disappear in summer. The principal are the Tirso, flowing S.W. into the Gulf of Oristano; the Dosa, flowing to the E. coast; and the Coglinas to the N.

Products, Trade, &c.—The valleys are remarkably fertile, and the mountain-slopes afford excellent pasture. The island in ancient times was so productive as to be termed the granary of Rome, but now the paucity and ignorance of the population, besides the want of roads and the deadly malaria (*Intemperie*) which prevails from July to October, hinder the progress of agriculture. Much of the soil is quite uncultivated, while one-fifth is covered with wood. The principal crops are wheat, barley, maize, and fruits, tobacco, cotton, flax, and madder. Wine is abundantly produced, chiefly of three kinds, *Vernaccia*, an acid and strong wine, *Malvasia* and *Muscato*, sweet wines. There are rich mines of lead, iron, manganese, nickel, cobalt, bismuth, lignite, and anthracite, chiefly in the district of Iglesias, which produced in the season of 1875-76 metals to the value of £435,639, and which are capable of yielding much greater returns when means of transport are improved, and the amelioration of the climate consequent on the better cultivation of the soil will allow them to be worked continuously. Along the coasts are valuable fisheries, chiefly of tunny, anchovies, and sardines. Salt and gunpowder are manufactured. Since the Franco-Prussian war there has been a considerable trade in cattle with Marseille, as many as 30,000 bullocks having been exported in the first half of 1873. In 1875, there were open in the island four lines of railways (Cagliari to Oristano 59 miles, Iglesias 33½ miles, Sassari to Porto Torres 12½ miles, to Ozieri *via* Ploaghe, 31 miles). In the same year the returns of British shipping at the four ports of S. were as follows:—In the direct trade in British vessels from and to Great Britain and British colonies at Cagliari, entered 10 vessels of 3789 tons, cargoes

£4850—cleared, 15 of 7752 tons, cargoes £26,955; at Carloforte, entered 8 of 3480 tons, cargoes £1043—cleared, 27 of 16,180 tons, cargoes £19,908; at Porto Torres, entered 2 of 426 tons, cargoes £5425—cleared, none; while in the indirect or carrying trade in British vessels from and to other countries, at Cagliari entered 16 of 10,708 tons, cargoes £2220—cleared, 11 of 6710 tons, cargoes £35,350; at Carloforte, entered 46 of 38,700 tons without cargoes—cleared, 30 of 27,160 tons, cargoes £40,880. The fourth port, Terranova, had no direct or indirect trade with Britain in 1875.

Race, Language, and History.—The inhabitants of S. are of Iberian origin, with an intermixture of Phœnician, Greek, Roman, and Spanish blood. They are still comparatively uninfluenced by civilisation, and with all the virtues exhibit many of the vices of a primitive race. They are proud, revengeful, and profoundly ignorant. About 1000 assassinations occur in the island annually, and of the pop. 87·98 per cent. in the country, and 84·05 in the towns, are unable to read. The language is of Romance origin. It differs, however, from all the Neo-Latin languages in forming its definite article (*su, sa*, in masc. and fem. singular, *sas, sas*, in plural), from *ipse* instead of *ille*; and that this difference was persistent as early as the 8th c. may be seen from a letter of 740 A.D., discovered and published in 1846 by Count Pietro Martini, then director of the library at Cagliari, which is earlier than the famous Oath of Strassburg by 102 years as the first known continuous specimen of a Neo-Latin dialect. S. was from about 500-480 B.C. ruled by the Carthaginians, who were succeeded by the Romans in 235 B.C. In 456 A.D. the island was captured by the Vandals, but was recovered by Justinian in 534. It was next occupied gradually by the Saracens, who were ejected by the Genoese and Pisans in 1025, when it became the possession of the latter. In 1297 it was granted by Pope Boniface VIII. to the King of Aragon, and it was governed from 1479 by Spanish viceroys. In 1714 Spain was obliged to cede it to Austria, which in 1720 exchanged it for Sicily to the Duke of Savoy, who in the same year assumed the title of King of S., which he exchanged in 1860 for that of King of Italy. See Marmora, *Voyage en Sardaigne ou Description Statistique, Physique et Politique, de cette Isle* (5 vols. Par. and Turin, 1839-60); Auguste Boullier, *La Dialecte et les Chants Populaires de la Sardaigne* (Par. 1864); and C. Corbetta, *Sardaigne e Corsica* (Milan, 1877).

Sardou, Victorien, a distinguished French dramatist, was born at Paris 7th September 1831. After studying medicine for some time, he devoted himself to history, and endured some years of poverty and distress as a teacher and writer in minor newspapers. His first drama, *La Taverne des Étudiants*, failed completely at the Odéon in 1854; and it was not until 1858, when Mdlle. Déjazet recognised his talent and took him under her protection, that the career of success began which has since then been almost uninterrupted. His most noted dramas are *Les Pattes de Mouche* (1861), (adapted in England under the title of 'A Scrap of Paper'); *Nos Intimes* (1861), ('Friends and Foes' and 'Peril'); *Nos bons Villageois* (1865); *La Patrie* (1869), ('Fatherland'); *Fernande* (1870), (adapted under the same name); *Dora* ('Diplomacy'); and his latest success at the Vaudeville, *Les Bourgeois de Pont d'Arcy* (1878). *La Papillonne* failed at the Comédie Française in 1862. His political satire *Rabagas* had an immense success in 1872, and in 1877 he was elected to the French Academy. Powerful invention and construction, firm characterisation and brilliance in dialogue, are S.'s most notable qualities as a dramatist.

Sargassum. See GULFWEEED.

Sargent is the name of more than one American family of talent and accomplishment. The first person of note bearing the name was **Winthrop S.**, born at Gloucester, Mass., 1st May 1753. He served with distinction in the War of Independence, was appointed by Congress surveyor-general of the North-West Territory (1786), was adjutant-general of St. Clair's expedition (1791) against the Miami Indians, took part in Wayne's expedition (1794-95), and was governor of Mississippi Territory in 1790 and in 1801. He was a member of the American Academy of Arts and Sciences, and of the Philosophical Society, and assisted Dr. B. S. Smith in preparing his *Papers relative to certain American Antiquities* (1796). He died 3d June 1820. His grandson, **Winthrop S.**, born at Philadelphia, September 23, 1825, was a lawyer by profession, but is best

known as a scholar, antiquarian, and *littérateur*. He edited from original MSS., with an introductory memoir, *The History of Braddock's Expedition against Fort Duquesne* (1855), *The Loyalist Poetry of the Revolution* (1857), and several reprints of curious Revolutionary tracts; he also wrote *The Life and Career of Major John André, Adjutant-General of the British Army in America* (Boston, 75 copies, 1861). He left incomplete at his death (at Paris, May 18, 1870) a *Catalogue Raisonné* of books relating to America. **Lucius Manlius S.**, born at Boston, Mass., 25th June 1786, studied at Harvard, and devoted himself to the advocacy of social reforms, particularly temperance, for which he lectured and wrote copiously. He died at West Roxbury, 2d June 1867. Among his chief writings are *Dealings with the Dead by a Sexton of the Old School* (1856), *Reminiscences of Samuel Dexter* (1858), and *The Irrepressible Conflict* (1861). See J. H. Sheppard's *Reminiscences of L. M. S.*—**Epes S.**, born at Gloucester, Mass., 27th September 1812, was educated at Harvard, took to journalism, and was successively on the editorial staff of the *Daily Advertiser*, the *Boston Atlas*, the *New York Mirror*, and the *New Monthly Magazine*. About 1847 he settled at Roxbury, near Boston, and for several years edited the *Boston Transcript*. S. is a very miscellaneous and prolific writer. Among his numerous works may be noted the plays, *The Bride of Genoa* and *Velasco*, produced with success in 1836 and 1837; the comedy *Change makes Change* (1841); a *Life of Henry Clay* (1842); *Fleetwood, or Stain of Birth* (1845), a novel; *The Mariner's Library*, and *American Adventure by Land and Sea*; an edition of the *Modern Standard Drama* (7 vols. 1846–50); *Songs of the Sea*, and other Poems (1847), one of which, 'A Life on the Ocean Wave,' is as popular in Great Britain as in America; the *Select Works of Benjamin Franklin, with Memoir and Notes* (1852); *The Priestess* (1855), a tragedy; *Arctic Adventures by Sea and Land* (1857); a new volume of *Poems* (1858); *Original Dialogues* (1861); *Planchette, or the Despair of Science*, an Account of Modern Spiritualism (1869); *The Woman who Dared, a Poem* (1869); and a *School Manual of English Etymology* (1873).—**John Osborne S.**, brother of the preceding, born at Gloucester, Mass., in 1810, studied at Harvard, passed for the bar, and practised several years at Boston, sat in the Massachusetts Legislature 1835–36, but has mainly devoted himself to political journalism. He has written several pamphlets on legal and political questions, but his most important contribution to literature is his essay, *Improvements in Steam Navigation and the Arts of Naval Warfare* (1844), containing a biographical sketch of John Ericsson.

Sari', the capital of the province of Mazanderan, Persia, in a flat plain, 15 miles S. of the Caspian Sea, and 80 miles S.W. of Astrabad. The streets are well paved, and several are planted with orange and other trees. The chief buildings are the Jamah Masjid, the palace of Agha Mohammed; and the Gumbaz-i-Salm-i-Tur, a cylindrical tower, 100 feet in height and 30 in diameter. There are seven colleges, five public baths, four caravanserais, and fifteen *abambers*, or reservoirs, dug deep in the earth, and filled in winter with water. The trade is insignificant, and is chiefly in rice and sugar. Pop. about 20,000.

Sark (Fr. *Sercq*), one of the Channel Islands, 6½ miles E. of Guernsey, with an area of 1274 acres, and a pop. (1871) of 546. It presents to the sea cliffs of from 200 to 300 feet high, hollowed into picturesque gullies and caves. Great and Little S., the two portions of which it consists, are joined by a dangerous couple or neck, 8 yards long and 5 feet broad, at a height of 200 feet above the sea. S. is a bailiwick of Guernsey (q. v.). The inhabitants are mainly employed in fishing and lead-mining.

Sarmatians, a collective name loosely applied to a number of non-Scythian or semi-Scythian tribes who inhabited Eastern Europe during the classic ages. They are mentioned by Herodotus and Hippocrates under the name *Sauromata* ('lizard-eyed'), and are described as the offspring of Scythians and Amazons, a legend which probably arose from the warlike habits of the Sarmatian women. In Strabo and Pliny they are very briefly mentioned, but Ptolemy divides them into the *European* and *Asiatic* S.; assigning to the former a territory extending from the Vistula and the Baltic to the Carpathians, the Black Sea, and the Tanais (Don); and to the latter the regions between the Tanais, the Caucasus, and the Caspian Sea. Two of the principal tribes of European S., the

Roxolani and the *Jazyges*, began to push westward in the 1st c. A.D., the former penetrating into Moesia, the latter into Hungary and the valley of the Theiss. In the barbarian invasions the S. are hopelessly intermingled with the Goths, Vandals, &c. The received theory represents them as consisting partly of Slavic and partly of Lithuanian tribes, and the root *S-rm* is considered to be identical with that of the words *Serbi*, *Servi*, &c.

Sarno, a town of Southern Italy, province of Salerno, on a river of the same name, 15 miles N.W. of Salerno. It has a cathedral, a school for the priesthood, some paper manufactories and foundries. The neighbourhood produces fine silk. Pop. (1874) 15,382. Near S. was fought the famous battle in which Narses the Byzantine general finally overthrew the Ostrogothic monarchy in Italy.

Sarpi, Pietro, commonly known as **Fra Paolo**, was born at Venice, August 14, 1552, early became distinguished in mathematical and metaphysical science. At the age of twenty-six he had become provincial in an order of Servites, and in 1588 was chosen procurator-general; but his rationalistic tendencies brought him under the accusation of the Inquisition, and S. was exiled from his native city. Chosen representative of Venice in a dispute with Paul V. regarding that Pope's secular powers, he overwhelmed the Papal party by his learning, eloquence, and subtlety. He was in consequence excommunicated, and his life was imperilled. Secluding himself within his monastery, he now devoted himself to the composition of his *Istoria del Concilio Tridentino*. This was printed at London in 1619 by Antonio de Dominis, the Protestant ex-bishop of Spalatro, who placed on its title-page the pseudonym of Pietro Soave Polano (an anagram on Paolo Sarpi Veneto). The book—perhaps a more brilliant and certainly a more elaborate attack on the Papal policy than any Protestant other than Luther ever attempted—was quickly translated into Latin and other tongues, and called forth in reply Cardinal Pallavicini's account of the same council. His complete works were published at Helmstädt (2 vols. Verona, 1750; 8 vols. *ib.* 1761–68), and at Naples (24 vols. 1789–90). S. died at Venice, January 15, 1623. See Fontanini's *Storia Arcana della Vita di Fra Paolo* (Milan, 1805); Bianchi-Giovini's *Biografia di Fra Paolo* (2 vols. Zurich, 1836; Fr. trans. 2 vols. Brussels, 1863); T. A. Trollope's *Paul the Pope and Paul the Friar* (1861); and A. G. Campbell's *Life of S.* (1875).

Sarracenia is the principal genus of the small order *Sarraceniacæ*, consisting of N. American marsh plants remarkable for the leaf-petiole being expanded into a pitcher-like organ, surmounted by the lamina shaped as a kind of lid. This pitcher is capable of holding a considerable amount of fluid, and in the older leaves is usually full of water. In some species—as *S. purpurea*, *S. flava*, and *S. rubra*—the water appears to be derived directly from the atmosphere, but the construction of other species, e.g., *S. variolaris*, suggests a secretion by the plant as the source.

Sarsaparilla (Span. *zarza*, 'a bramble,' and *parrilla*, 'a vine,' or Parillo, who is said to have first used it medicinally) consists of the roots, with portions of the rhizome or 'chumps' attached, of several species of *Smilax*, an extensive genus of monocotyledonous climbing shrubs with tuberous or fibrous root stocks. They are natives of the warm, temperate, and tropical regions of both hemispheres, and are remarkable for their medicinal properties. The varieties of the drug met with in commerce are numerous, and the different species of which they are the produce is not yet settled amongst botanists. The trade divide S. into two principal groups according to the amount of starch contained in the drug. In the starchy section we have the Caraccas S., of a pale-brown colour and thick swollen contour; the Brazilian or Para S., in which the roots are slender and wavy, probably obtained from *S. papyracea*; the Honduras S., which has a somewhat acrid taste; and the Guatemala S., which differs from the Caraccas by its brighter orange-brown colour. In the non-starchy group the most important are—Jamaica S., of a reddish-brown colour; Lima S., which closely resembles it in external appearance, but not in tint (both, however, are probably obtained from the same species, viz., *S. officinalis*); and Vera Cruz or Mexican S., the produce of *S. medica*. Two European species (*S. excelsa* and *S. aspera*) yield an inferior kind of S.

The roots of the medicinal species of *Smilax* contain mucilage, lignin, starch, volatile oil, resin, and a crystalline principle

called smilacin. As a medicine, S. is used in decoction and infusion as a diaphoretic, tonic, and alterative, and is administered in scrofula, syphilis, and concomitant diseases. Several species of *Smilax* are known as China root, of which *S. China* is said to possess alterative and sudorific properties, and is used in the East for syphilis; and *S. pseudo-China*, or American China-root, is variously employed in the United States. The root of *Ripogonum parviflorum* is known as New Zealand S. from serving in that country as a substitute for real S. For a similar reason *Hemidesmus Indicus* (*Asclepiadaceæ*) is called Indian S. American or wild S. is *Aralia nudicaulis* (*Araliaceæ*), and is used like S. as a diaphoretic and alterative.

Sarthe, a N.W. department of France, bounded N. by Orne, S. by Maine-et-Loire and Indre-et-Loire, E. by Eure-et-Loir and Loir-et-Cher, W. by Mayenne. The surface is mostly level, broken here and there with low hills clothed with vines. There are also considerable forests. S. is well watered. The chief rivers are the Sarthe and Huisne, whose basins comprise the most fertile districts in the department. The climate is mild, but humid. Agriculture is rapidly progressing, and wheat, potatoes, clover, grasses, hemp, and fruit (walnuts, chestnuts, pears, and apples), are produced in large quantities. The wine is of mediocre quality. Cattle, sheep, and swine are reared in great numbers for the Paris market. The department has coal-pits, iron-works, and numerous other kinds of industrial works. Pop. (1876) 446,239. The chief town is Le Mans (q. v.).

Sar'ti, Giuseppe, a versatile composer, whose works were in great repute during the 18th c., was born at Faenza, December 28, 1729. He was for ten years chapel-master at Copenhagen, after which he produced many operas in Italy with brilliant success, and from 1784 to 1801 he occupied a princely position as director of court music at St. Petersburg. S. died at Berlin, July 28, 1802. His operas, distinguished for grace, melody, and inventive power, number forty-three, the most famous, perhaps, being *Giulio Sabino*, produced at Venice in 1781. See Fétis, *Biog. Univ. des Musiciens* (new ed. 1878).

Sar'to, Andrea del, an Italian artist, born at Florence in 1488, began life as a goldsmith and chaser in metal, but early turning to painting, studied under Pietro di Cosimo, and acquired in his own time the proud title of 'Andrea senza errori,' or the Faultless. His real name was Andrea Vannucci, and he was called *del S.* on account of his being the son 'of a tailor.' In 1518 he visited the court of François I., where he executed a number of pictures, some of which still adorn the Louvre. In Paris he was loaded with honours and gifts. Yet he was induced to return to Italy within a year by the importunities of his infamous wife, Lucrezia del Fede. Under the influence of Lucrezia, the fair model of his Madonnas, he embezzled the sums entrusted to him by the king for the purchase of works of art in Italy. To this perfidious creature Andrea sacrificed honour, fame, and friends, only to be shamelessly abandoned by her on his wretched deathbed, when stricken in 1530. Specimens of his art are in almost every large gallery, but fine examples are rare out of Naples. His easel pictures are generally less esteemed than his frescoes, of which the chief are the Virgin Mary series, including the 'Madonna del Sacco' in the Nunziata, and the scenes from the life of St. John in a cloister which formerly belonged to the Campagna dello Scalzo. Perhaps his noblest easel-picture is the so-called 'Disputa della SS. Trinità' in the Pitti Palace. See Biadi, *Notizie inedite della Vita d'Andrea del S.* (Flor. 1830), and Reumont, *Andrea del S.* (Leips. 1835).

Sarto'rius, Georg, Freiherr von Waltershausen, a German historian, was born at Kassel, 25th August 1765, and died 24th August 1828. His most important work is *Geschichte des Hanseatischen Bundes* (3 vols. Gött. 1802-8), to which his *Urkundliche Geschichte des Ursprungs der Deutschen Hanse bis zum 13. Jahrh.*, edited by Lappenberg (2 vols. Hamb. 1830), forms a valuable addition.—**Wolfgang von Waltershausen S.**, son of the preceding, and a distinguished geologist, was born at Göttingen, December 17, 1809. Subsequently to 1833, when he completed his university course, he made several journeys in the interests of science, and was, in 1847, appointed professor of geology and mineralogy in the university of his native town. In 1859 he travelled in Russia, and in 1864 went for the third time to Sicily, where also he resided 1869-70. He died at Göttingen,

October 16, 1876. His works are *Atlas des Etna* (1848-59); *Physisch-Geographische Skizze von Island* (1847); *Geolog. Atlas von Island* (1853); *Ueber die Vulkanischen Gesteine in Sicilien und Island* (1853); *Ueber die Klimate der Gegenwart und der Vorwelt* (1865), the last a prize essay published at Haarlem.

Sa'rūm. See SALISBURY.

Sarza'na, a town of N. Italy, province of Genoa, 67½ miles E.S.E. of that city by rail. It has a noble Gothic cathedral, begun 1355, and to the E. the picturesque fortification of Sarjanella. Pop. (1874) 9533. S. was called *Sergiana* by the Romans, also *Luna Nova*, from its occupying the site of the ancient *Luna* or *Luno*, the most northern of the Etruscan cities.

Sash, in carpentry, the wooden framework of a window, composed of side styles joined at top and bottom by rails, with inner cross pieces or bars for holding the panes of glass. A casement S. opens on hinges like a door; a sliding S. moves vertically up and down, being attached to ropes or chains passed over pulleys, and counterbalanced at the ends.

Sash. Crimson sashes of silk are worn across the shoulder by officers, and crimson cotton sashes by sergeants in the British army. They were formerly worn round the waist. In the cavalry they are tied on the right side, and in the infantry on the left. In full dress a narrow S. of gold and crimson silk is worn by officers.

Sas'ine, a term of Scotch law denoting the act of giving legal possession of feudal (see FEU) property, or the legal writing by which that fact is proved. By the Titles to Land, 1858 (Scotland) Act, the ceremonial previously necessary to the validity of a deed of S. is, since the passing of the Act, unnecessary. Instead, the conveyance may be recorded in the Register of Sasines.

Saskatch'ewan, or **Nelson**, one of the largest rivers in the Dominion of Canada, is formed by the junction of two branches, the North and South S., which rise near each other in a summit-glacier in the Rocky Mountains near Mount Hector, whence they flow E., gradually diverging, and then again converging, till they reach a point 550 miles E. of their source, where they unite. The S. then flows for 370 miles E. to Lake Winnipeg, forming on its way Cedar Lake and the Grand Rapids. From Lake Winnipeg it flows first N. then E. to Hudson's Bay. Its total length from the source of the southern branch is 1740 miles, and it drains an area of 500,000 sq. miles. The S. is navigable throughout most of its course, and steamers have ascended to within 300 miles of its source. The country has yet to be opened up, but contains many valuable minerals and much arable land. See the Earl of Southesk's *Saskatchewan and the Rocky Mountains* (Edin. 1875).

Sass'afras is a genus of *Lauraceæ* (q. v.), natives of N. America and the E. Indies. *S. officinalis*, known specially as the S.-tree, is a large diœcious tree of dry open woods in Canada and the United States, and is remarkable for the diversity it presents in the size and shape of its deciduous leaves. The root, wood, and bark have stimulant and sudorific properties, which mainly depend on the presence of a volatile oil. In medicine various preparations of S. are used for rheumatism and skin affections, generally, however, in combination with more potent drugs. 'S.-tea,' with sugar and milk, forms the drink known as *saloop*. From the young shoots a kind of beer is made; the leaves are used as an admixture in sauces, and for other culinary purposes; the fruit yields a perfumer's oil, and the wood and bark furnish a yellow dye. Oriental S. is *S. Parthenoxylon*, partaking of many of the qualities of the above species. The name S. is also borne by various other trees, thus Orinoco S. is *Nectandra cymbarum* (see PICHURIM BEANS and GREENHEART); Australian S. is *Atherosperma moschata*; Cayenne S. is *Licaria guianensis*, which yields excellent timber; and Swamp S. is *Magnolia glauca* (q. v.).

Sass'afras Nuts. See PICHURIM BEANS.

Sassan'idæ, a native dynasty which held the throne of Persia from 228 A.D. to 641. Its founder was Ardeshir, who defeated Arduan, the last of the Arsacidæ (228), and its last monarch Yazdegird III., who was finally defeated at Nehavend by the Arabs (641), and murdered when an exile in Khorasan (651). See PERSIA.

Sassari, next to Cagliari, the most important town in the island of Sardinia, is situated in the N.W. part of the island, 12½ miles by rail from its seaport, Porto Torres, on the Gulf of Asinara. It is well built, has a handsome piazza, adorned with a statue of Azuni (1862), the eminent teacher of commercial law, and some fine public buildings, including a large cathedral, a castle (now a barrack), university (1776), with 80 students; town-hall, theatre, and hospital, and beautiful promenades. It has a considerable trade in grain, wine, and olive oil, fruits, wool, and tobacco. Pop. (1877) 33,711. In 1855 S. lost one-third of its inhabitants from cholera within twenty days.

Sasseram (Sahsram), a town in the district of Shahabad, Bengal, British India, situated beneath the Kymur hills, 72 miles S.E. of Benares, and 60 S. of Arrah. Pop. (1872) 21,023. It was the birthplace of the Afghan Emperor Shere Shah, who expelled the Mogul Humayun, the father of Akbar, from Delhi in 1539. It contains the tomb of Shere Shah's father, and also of Shere Shah himself; the latter is a handsome structure, erected on an island in an artificial lake. There is still a large Mahomedan population at S. The exports are valued at £6000, the imports at £20,000.

Satan. See DEVIL.

Satellites (Lat. *satelles*, 'an attendant'), in astronomy, are the secondary bodies in the solar system, which revolve round the planets. Excepting Mercury and Venus, all the known planets have such attendant orbs. The earth has one, Mars two, Jupiter four, Saturn eight, Uranus four, and Neptune one at least. Some astronomers have suspected one to exist in the case of Venus, but no certain observations are recorded. Probably Uranus and Neptune have both a more numerous retinue of moons; but because of their great distance these are beyond our limits of vision. In the case of these last two planets the motion of the S. round their primaries is retrograde. The various S. are more particularly noticed under MOON and the particular articles upon the planets.

Satin (corruption of Chin. *son-twan*), a familiar kind of silk stuff having a beautifully smooth shining surface, originally brought from China. The glossy surface is owing to the fact that only every fifth, seventh, eighth, or other thread is raised for one shot of the weft. Accordingly four-fifths, six-sevenths, or seven-eighths of the warp are seen on the face of the finished fabrics, which are accordingly known as '5-warp S.', '7-warp S.', and so on. Oriental satins were formerly esteemed as the best, but now French stuffs of Lyon *fabrique* surpass all others. Satins called *caffard* and *maliques* are frequently mentioned in inventories belonging to the 15th and 16th centuries; the former stuff was manufactured at Bruges, and the latter at Genoa.

The term *satinet* is applied to an inferior kind of S., and also to a glossy stuff made from cotton and wool.

Satin-wood, a name applied to several kinds of ornamental woods derived from different trees grown in tropical regions. It is of a light-yellow colour, hard, curled, and mottled or figured so as to display a satiny lustre when polished. It is employed as a veneering wood for furniture, picture-frames, and in inlaying. The S. brought from India is the product of *Chloroxylon Swietenia*, and that of the Bahama Islands and Guiana is derived from *Ferolia Guianensis*. It is imported in logs 10 feet long by 8 inches square, or thereby.

Satire (Lat. *sátira*, old form *sátúra*) is a species of poetry peculiar to the Romans, and in no wise to be confounded with the satyric drama of the Greeks (Gr. *satyros*, Lat. *satyrus*). The term *satúra* (root *sat* 'enough') is the feminine of the adjective *satur*, 'full,' and originally signified, with the substantive *lanx*, 'a dish,' either expressed or understood—a dish made up of a medley of ingredients. Especially it meant a kind of sausage. It was afterwards used to denote a law with many clauses. Finally, it was employed as a general term for a medley resembling farce, and like the Fescennine Verses (q. v.) consisted of sallies of sharp banter and uproarious buffoonery, improvised, on the occasion, without any pretension to regular plot or definite form. The introduction of the legitimate drama by Livius Andronicus (q. v.) and the influence of Greek models soon modified and improved the quality of Roman S. Ennius (q. v.) laid down for himself distinct rules for satiric composition. But the high merit of developing Roman S. and giving to it

new form and direction is due to Lucilius. Unlike the borrowed forms of Roman literature, it had a long and vigorous life. The genius of comedy soon disappeared. The epics of Ennius and Virgil were succeeded by feeble efforts. Catullus and Horace were Rome's only lyricists. But this native product of Roman genius, strong, keen, and Roman-like in Lucilius, attained unequalled perfection in Horace, whose satires reflect in happy combination the manners, humours, foibles, and vices of the Augustan age. But Horace looked on foibles and vices as things to be ridiculed and reprov'd, not as dangers to be dreaded and deplored. To him succeeded Persius (q. v.), who with the rigour and moroseness of a Stoic declaimed against the depravity and vices of mankind; while not long afterwards the spirit of S., as if catching fresh fire from the hell of Roman depravity, reappeared in Juvenal (q. v.) with unabated power and the despairing earnestness of righteous ire. Even in Martial (q. v.) its edge continued keen.

During the later centuries of the Roman Empire and the dark ages, S. like many other forms of literature slumbered in Europe. But in the Middle Ages it burst forth into newness of life in France, Italy, Germany, England, and Scotland. The Fablieri, among the *trouvères* of Northern France, are noted for the gaiety of their S. Rutebeuf (q. v.) was the prototype of Voltaire. Walter Map (q. v.) in his *Goliard-poems* is one of the wittiest satirists that England ever produced. Later on, Europe resounded with the fame of Ulrich von Hutten (q. v.), 'the champion of *humanism*,' Erasmus (q. v.), Rabelais (q. v.), Sir David Lyndsay (q. v.), and George Buchanan (q. v.)—all bitter and uncompromising denouncers of the vices of the clergy. The satires of these, however, consisted in the substance—the trenchant invective alone. They were not cast in the Roman mould. Vauquelin (q. v.) founded the school of modern French S. based on the ancient lines. Mottin, Sigogne, Berthelot, Regnier, and Théophile Viaud wrote satirical pieces characterised alike by elegance of diction and impurity of expression. In the 17th and 18th centuries Dryden (q. v.), Butler (q. v.), Dean Swift (q. v.), Andrew Marvel (q. v.), Dr. Edward Young (q. v.), Dr. Johnson (q. v.), Churchill (q. v.), Cowper (q. v.), Walcott (q. v.) *alias* Peter Pindar, Gifford (q. v.), Arbuthnot (q. v.), and Robert Burns (q. v.), made for themselves a reputation as satirists; while Boileau (q. v.), the 'Juvenal of France,' Voltaire, and many others showed that S. was congenial to the Gallic soil. In Germany the most famous names are those of Hagedorn, Rabener, Sturz, Stolberg, Kästner, Wieland (q. v.), Tieck (q. v.), and Goethe (q. v.). The present century can boast of the names of Beranger (q. v.), Byron (q. v.), James and Horace Smith (q. v.), and Hood (q. v.), in poetry; and Hook (q. v.), Jerrold (q. v.), Thackeray (q. v.), and Carlyle (q. v.) in prose. Among transatlantic names, Lowell (q. v.) and Holmes (q. v.) pre-eminently deserve mention. See Brown's *History of Roman Classical Literature* (Lond. 1853); Sellar's *Roman Poets of the Republic* (Edin. 1863); Thompson's *History of Roman Literature in the Encyclopædia Metropolitana*; Mommsen's *History of Rome*; Niebuhr's *Lectures on Roman History*; and James Hannay's *S. and Satirists* (Lond. 1854).

Sátapura, a range of mountains in India, running E. and W. across the peninsula for about 600 miles, parallel to the Vindhya, with which it is by some authorities included. It forms the watershed which separates the Nerbudda basin from that of the Godavery, flowing S.E., and the Taptee, flowing W. The highest point is 4454 feet; the general elevation is about 2000.

Sa'traps (Pers. *khshathrapavan*), governors or viceroys of provinces in ancient Persia. Theoretically they were supreme only in civil matters, but on the decline of the Empire many assumed absolute power and independence.

Satsuma Ware, a fine kind of pottery or semi-porcelain made in Japan, having a felspathic glaze of a light straw colour, the surface of which is covered with a net-work of fine cracks. Red and green colours and dulled gold are employed for decorating S. W., a favourite ornament being the crysanthemum, and pheasants and other fowls are also frequently introduced. Fine old S. W. is highly esteemed by collectors.

Sat'urn (old form, *Saturnus*, 'god of sowing'), a mythical deified king of Latium, whose reign was the so-called Golden Age. He was god of the corn and fruits of the earth, and was worshipped along with Ops, the goddess of plenty. In his

honour the Italians celebrated annually in December the *Saturnalia*, a kind of rustic carnival or harvest-home. Latterly he was identified with the Greek god Kronos, the son of Uranus and Ge, the first rulers of the universe. Uranus having thrown some of his sons (the Titans) into Tartarus, Kronos dethroned him, but was himself afterwards displaced by his son Zeus. Kronos is often represented as an old man grasping a sickle. A legend says he emigrated to Italy and reigned there. Possibly this may in part account for his identification with the mythical Luvian king.

Sattára, the chief town of the district of the same name, in the Bombay Presidency, British India, situated in the highlands of the Deccan, 115 miles S.E. of Bombay, and 55 S. of Poonah. Pop. (1872) 24,484. It lies in a hollow commanded by a very strong fort, which was captured by the British in 1818.—The district of S., which is bounded W. by the Western Ghats, has an area of 5378 sq. miles. Pop. (1872) 1,116,050. This tract was ethnologically the cradle of the Mahratta race; and the great Sivaji (q. v.) established himself at the fort of S. about 1660. Here his descendants maintained themselves, though with diminished powers, as the nominal leaders of the Mahratta confederacy until 1848. In that year the last Rajah died without issue; and his deathbed adoption was set aside by Lord Dalhousie, the Governor-General of India, in accordance with the then accepted doctrine of lapse. The chief crops are millets, rice, cotton, wheat, sugar-cane, and tobacco. The only manufacture is cotton-weaving. S. suffered severely during the famine of 1877, especially in loss of cattle.

Saturn, the sixth planet in order of distance from the sun, describes in 10,759²/₂₂ days, or a little less than thirty of our years, an orbit whose semi-major axis is 872,137,000 miles, whose excentricity is .055996, and whose inclination to the plane of the ecliptic is 2° 29' 28". In absolute magnitude S. comes after Jupiter, having an equatorial diameter of 70,150 miles, and a volume 686⁷/₇ times that of the earth. Its mass is only 89⁷/₇ times that of the earth, on account of its inferior density. It rotates very rapidly upon its axis, the length of its day being, according to Professor Hall of Washington, 10 hours 15 minutes. The consequent oblate form is easily recognised with a good telescope. It has eight satellites, the two innermost of which and Hyperon (the seventh) are difficult to observe. The most striking feature, however, of this planet, is the system of rings, which lies nearly in the planet's equatorial plane, and is inclined to the ecliptic at an angle of 28° 10' 22". They were first seen by Galileo, through whose comparatively poor telescope they appeared like two attendant bodies, one on each side of the planet. Huyghens was the first to discover the real annular nature of the appendage; and the close scrutiny of subsequent observers has revealed that there are three distinct rings, two bright and the other dark. The dark ring, which is nearest the planet, has sometimes been seen divided. The distance between the inner edge of the dark ring and the surface of the planet is 10,322 miles; and the entire breadth of the system of rings is 37,570 miles. Regarding the stability of such a material system, Laplace showed that the mass of the ring must be so adjusted that its centre of inertia must *not* be coincident with the planet's centre of inertia—otherwise the equilibrium would be essentially unstable. Bond and Pierce, two American astronomers, took up the same question, and the latter demonstrated that the system, if solid, must be divided into a great number of concentric rings. The whole inquiry was finally settled in a masterly essay contributed by Professor Clerk Maxwell, which gained the Adams' Prize in 1857. In this he proved the physical impossibility of these rings being either continuously solid or continuously liquid; and demonstrated the permanent stability of a ring of discrete bodies. Saturn's rings are, therefore, most probably made up of swarms of meteorites or minute satellites, each revolving independently round the planet.

Saturnalia, an ancient festival celebrated by the Latins in honour of Saturn (q. v.) who taught them agriculture and the arts of civilised life. It fell towards the close of December when the toils of the husbandman were over, and the ingathering of the crops disposed the heart of the rustic to thankfulness and joy. Unrestrained merriment and jollity characterised the harvest home—the simple festival of the national god. Business was suspended, courts were closed, schools kept holiday, the distinctions of rank were reversed, slaves wore the badge of

freedom (*pileus*), and, arrayed in the vestments of their masters, were served by them at table. All resounded with feasting and revelry and mirth, presents were sent from friend to friend, *Io S.* was shouted through the streets, and sacrifices were offered with uncovered head. No war could be begun, no malefactor punished, while the festival lasted.

During the Commonwealth the whole month of December was dedicated to Saturn, the 19th being set apart for his sacred rites. But when the month was lengthened by two days on the adoption of the Julian Calendar the S. fell on the 17th, a change which produced endless confusion. Augustus therefore ordained that the 17th, 18th, and 19th should be sacred to Saturn in all time coming. Gradually the number of days was extended to seven (*cf.* Mart, *Epigr.* xiv. 72, 2), during which three separate festivals were celebrated: 1st, the S. proper; 2d, the *Opalia*, in honour of Ops, Saturn's wife; 3d, the *Sigillaria*, in which little earthenware figures (*Sigilla*) were sold as toys for children.

Saturnian Verse, the name given to the primitive form of Roman national poetry. As applied to the compositions in rustic measures of the early Italian peoples, S. V. means nothing more than 'early,' 'old-fashioned.' But any notion which we can form of the early Roman literature must of necessity be incomplete. The fragments which remain evince genuine Roman strength. Livius Andronicus (q. v.) translated the *Odyssey* into S. V.—a work which was a school-book in the days of Horace (*see* Hor. *Epist.* II. i. 69–71). The few lines which we possess of his version prove conclusively the great irregularity of the S. V., or rather of the Saturnian metre. Cn. Naevius (q. v.), a writer of original power and undoubted genius, succeeded to Livius. The best known, and withal the most favourable specimen of his style, is to be found in his epitaph:—

'Mortales immortales flere si foret fas,
Flerent divæ Camenæ Nævium poetam,
Itaque postquam est Orcino traditus thesauro,
Oblii sunt Romæ loquies Latina lingua.'

S. V. is not a Greek measure as Bentley supposed. That it is found in the verses of Archilochus is accidental. Hermann's view that it is of Etruscan origin is of small account. It is purely a native measure, such as we find in the Norse legends, in the 'Cid,' in the early English ballads, and in the early poetry of all countries.

With regard to the laws of S. V. it is impossible to speak, for when we consider the inscriptionary tablets set up in the Capitol by the *Triumphatores*, the song of the Arval Brothers, and the poetical though semi-prosaic records of the achievements of early Roman heroes, we are constrained to admit that this must have been a metre—if metre it was—of endless variety.

Satyriasis is a symptom of certain forms of mental disease in which there is an ungovernable impulse to acts of venery.

Satyrs, in Greek mythology, personifications of the luxuriant fertility of the vital principle in nature. They attended upon Dionysus, and are represented as grotesque beings of human form, yet in some respects resembling goats, with tails, horses' ears, snub noses, and coarse bristly hair. They are frequently depicted dressed in skins, gailanded with wreaths, and carrying bottles of wine, and they appear in positions indicative of their voluptuous character—drinking wine, dancing with nymphs, sleeping after a debauch, &c. Though not named in Homer, they are often introduced by the poets since Hesiod, and by sculptors, especially Praxiteles. The Semitic *seirim* ('hairy ones') and the Egyptian god Mendes are kindred conceptions.

Sauces are prepared condiments, seasonings, or relishes for various kinds of food, made up of all kinds of spices, condiments, acid vegetable substances, fruits, oils and fats, anchovies, lobsters, oysters, &c. As may be imagined, the variety of preparations from these and other materials is endless. Certain S. in which strong spices prevail are valued for their stimulant heat, others having acid properties exert a solvent influence on animal food, and such as are fatty or contain butter are useful with food in which fat is deficient.

Saucisse (Fr. 'a sausage') or **Saucisson**, in fortification, a bundle of fagots, longer and stouter than fascines, used for supporting earthworks, &c.; also a tube of leather or pitched flax, filled with gunpowder, employed in military mining to explode a charge.

Sauer-Kraut (Ger. 'acid vegetables') is a favourite preparation of cabbages throughout Germany. It is prepared by

cleaning white cabbages, chopping them into small pieces, packing the pieces hard down into a cask, with layers of salt mixed with juniper berries and caraway fruits. The mass quickly begins to ferment, and when the fermentation is complete, the preparation is closely covered over and placed in a cool position for use. S.-K. is usually eaten with animal food, especially pork.

Saugor (Sagar), the chief town of the district of the same name, Central Provinces, British India, 109 miles N.W. of Jubbulpur, and 223 S.W. of Allahabad, on the borders of an artificial lake, 4 miles in circumference. It was ceded to the British by the Peishwah in 1818. The fort is a large building, in which the European residents held out for eight months when the Sepoys mutinied in 1857 and all the country was abandoned. There are several fine public buildings, including one of the best High Schools in India. The barracks contain a European regiment and two batteries of artillery. In 1875-76 the registered exports were valued at £47,000; the imports, which included wheat and other food-grains, cotton goods, salt, and sugar, at £166,000. Pop. (1872) 45,665.—*S. distict*, which occupies a plateau in the N.W. of the Central Provinces, has an area of 4005 sq. miles; pop. (1872) 527,725. The staple crops are wheat and sugar-cane; the minerals, iron and sandstone.

Saugor (Sagar) Island, a long strip of land, covering about 220 square miles, at the left side of the mouth of the Hoogly river, in the district of the Twenty-four Pergunnahs, Bengal, British India. It is the scene of a great pilgrimage and fair in the month of May, said to be attended by 200,000 people. The chief ceremony consists of bathing in the sea. A lighthouse, commenced in 1808, stands on the seaward point.

Saul, the son of Kish, of the tribe of Benjamin, was the first of the kings of Israel. After the state of things described in the Book of Judges had continued for a certain time, the tribes of Israel began to realise that they could not maintain their existence as a nation unless they combined and elected a single chief 'to be their supreme judge in times of peace, and their commander in times of war.' A crisis came in the time of Samuel (q. v.) the prophet, when, after having been reduced to a condition of complete subjection by the Philistines on the S. (cf. 1 Sam. xiii. 6, 19, 20), they were threatened by the Ammonites on the E. (1 Sam. xi. 1). S. distinguished himself by leading the people victoriously against the Ammonites, and thinking that he was the man they wanted to lead them against the Philistines, they at once elected him king. After a long reign (forty years, Acts xiii. 21), S. was killed in a battle with the Philistines (1 Sam. xxxi.). His character is interesting and very human. In spite of the 'evil spirit' that often mastered him, there was something genuine both in the man and the king.

Saumarez, James, Baron de, born in St. Peter Port, Guernsey, March 11, 1757, entered the navy at the age of thirteen, served under Sir Peter Parker in the attack on Charles-town in 1776, and was made commander after the engagement between the English and French fleets on April 12, 1782. For his gallant capture of the French frigate *La Reunion*, in 1793, he obtained the honour of knighthood. He was present at the engagement off Cape St. Vincent, and received severe wounds at the battle of the Nile, in which he was second in command. In 1801 he was created a baronet and rear-admiral of the blue, and on July 10th of the same year he defeated off Cadiz a French and Spanish squadron of ten line-of-battle ships and four frigates with a fleet of half the size, causing the enemy a loss of three ships and 3000 men. For this victory he was presented with the freedom of the city of London, gained the Order of the Bath, was thanked by Parliament, and in 1803 was awarded a pension of £1200. In 1809, while in command of the Baltic fleet, he captured two large Russian flotillas. In 1814 S. became admiral, in 1821 he was named vice-admiral of Great Britain, and in 1831 he was raised to the peerage as Baron de S. of Saumarez, in Guernsey. He died in Guernsey, October 9, 1836. See Sir John Ross's *Memoirs of Admiral Lord de S.* (2 vols. 1838).

Saumur, a town of France, department of Maine-et-Loire, on the left bank of the Loire, 32 miles S.E. of Angers by rail. It is a great cavalry station, with large barracks and an important riding-school, has manufactures of rosaries, crucifixes, &c., and carries on a considerable trade in grain, dried fruits, vegetables, and brandy. A well-known white wine is made in the neighbourhood of S. Pop. (1872) 11,028. S. first appears in

history in the 4th c. Pippin built a church in it in the 8th c., but the oldest building now existing is the church of Saint-Pierre, which dates from the 12th c. It was a flourishing city and a stronghold of Protestantism until the revocation of the Edict of Nantes, which ruined its prosperity. During the Vendean rising S. was an important military position, and was the scene of a great victory gained by the insurgents under Laroche-Jaquelein, 10th June 1793.

Saunderson, Nicholas, LL.D., a celebrated mathematician, born in 1682 at Thurleston, Yorkshire. When only a year old he was made blind by an attack of smallpox, but nevertheless was highly educated both in classics and mathematics, the former being taught by word of mouth, the latter by means of a series of ingenious devices arranged for the purpose. For mathematics he had such a great natural aptitude that in 1707, at the age of twenty-five, he delivered a course of lectures on the Newtonian philosophy and Newton's theory of optics at Christ's College, Cambridge. In 1711 he succeeded Whiston as Lucasian professor of mathematics, which post he held until his death on the 19th April 1739. He possessed in an abnormal degree the fineness of sensibility usually peculiar to the blind, and his extraordinary power of grasping the most recondite conceptions of solid geometry remains to this day a psychological problem. His treatise on Algebra, much valued in its time, was published the year after his death, and another treatise on Fluxions in 1756.

Sauria, a name formerly used to denote the crocodiles, alligators, and lizards, in which well-developed scales occur, and in which true teeth are found.

Saurin, Jacques, belonged to a distinguished Protestant family in the S. of France. Born at Nîmes, January 6, 1677, he studied philosophy and theology at Geneva until the revocation of the Edict of Nantes, when he joined the English army, serving under Lord Galway, and afterwards in Piedmont. When the Duke of Savoy had made peace with France he completed his studies, and in 1701 he went to London, where he became pastor of the Walloon Church. In 1705 he removed to the Hague, where he died, 30th December 1730. S. acquired some distinction as a heretic, but has a fairer claim to remembrance as the most eloquent preacher of his time. His published writings comprise twelve volumes of sermons, six of which have been translated into English.

Sauroid Fishes, a name synonymous with *Ganoid* fishes, and applied to them on account of the perfect development of their scales. Examples are the Bony Pike or *Lepidosteus* of N. America, and the Sturgeons.

Sauropsida, one of the primary groups of *Vertebrate* animals represented by reptiles and birds. The two classes are closely connected by structural affinities. *Lungs* constitute the sole breathing organs of the group, no gills being developed. The exoskeleton consists of scales or feathers. The bodies of the vertebra are always well ossified. The skull is joined to the vertebral column by a single *condyle* or articulating process, whilst two such condyles occur in Mammalia (q. v.). The *lower jaw* of S. is compound, each half consisting of several pieces. The lower jaw is further articulated to the skull by means of a special bone, the *quadrate Bone* (q. v.), which in mammalia is represented by the *malleus* of the ear. The 'ankle-joint' of S. is 'situated not between the tibia and astragalus, as in all mammalia, but between the proximal and distal divisions of the tarsus' (Huxley). The *digestive system* of S. ends in a *cloaca* chamber common to the efferent ducts of the urinary, digestive, and generative systems. A four-chambered heart exists in some S. (crocodilia and birds), other S. possessing a three-chambered heart only. No complete *diaphragm* separates the thoracic from the abdominal cavity. The *Wolffian bodies* of the embryo S. are replaced by true *kidneys*, as in mammalia, and the *cerebral hemispheres* are never united by a *corpus callosum* or connecting band of nervous tissue. An *amnion* and *allantois* are developed in the embryo, but no *mammary glands* are developed in the S. In their *reproduction* the S. are invariably oviparous, or egg-producing. Some few are *ovo-viviparous*, i.e., retain the eggs within their bodies until the young are hatched. See ORNITHOLOGY and REPTILES.

Sau'sages are preparations of various kinds of meat, such as pork, chicken and ham, or beef chopped up small, mixed with

flour or bread-crumbs, spiced and filled into gut skins. They are cooked for use either by frying, stewing, or boiling. As *S.* are very highly spiced, and form a favourite food with the humbler classes, inferior and unsound pork, beef, horse-tongues, and hind-quarters of horses from the knackers' yards are used in their preparation, and cases of poisoning have been known to arise. *S.* bought in large towns, therefore, cannot be depended upon. During the Franco-Prussian War in 1870, a kind of pea-sausage (*Erdswurst*) was much eaten by the German troops. It was composed of fat pork, pea-flour, and salt, and was easily cooked or made into soup; but it tended to produce flatulence and diarrhoea, and men quickly tired of it.

Saussure, Horace Benoît de, a Swiss naturalist and physicist, was born at Conches, near Geneva, February 17, 1740. At the early age of twenty-two he was appointed to the chair of physics and philosophy in Geneva University. Six years later he began his scientific travels, amassing most valuable observations on the structure and composition of rocks, on the motion of glaciers, and on various meteorological phenomena. He crossed the Alps fourteen times by eight different routes, ascended Mont Blanc in 1787—a feat previously performed only by two others (Balmat and Paccard) in 1786—and Monte Rosa in 1789. He also travelled through France and Italy, and visited England and Germany. Not only, however, was *S.* a great geologist and naturalist, he was one of the first physicists of his time. The instruments he used were improved or modified by himself, and a hygrometer still goes by his name. In 1786 he resigned his chair, and in 1798 was nominated professor of natural history in the central school of the department of Léman, formed at that time by the union of Geneva with France. *S.* died January 22, 1799. He was the author of various short but valuable essays on electricity, on water, on hygrometry, &c., besides many memoirs on allied subjects in the *Journal de Physique*, the *Journal de Paris*, and other scientific journals. His great work is his *Voyages dans les Alpes* (Neuch. and Gen. 1779-96; new ed. 1853). See Senebier, *Mémoire sur la Vie et les Écrits de S.* (Gen. 1801).—His son, **Nicolas Théodore de S.**, was born at Geneva, October 14, 1767, and was professor of mineralogy and geology in the university of that city till his death, April 18, 1845. His work, *Recherches chimiques sur la Végétation* (1804), was an important contribution to the chemistry of plants, at that time quite a new field of investigation.

Sauterne' is the name of a class of French white wines produced in the Gironde district. The grapes from which *S.* is made are allowed to become dead ripe before they are collected. The principal growths of *S.* are Barsacs, Sauternes, and Bommes, and the Château Yquem *S.* is one of the finest wines grown in France. Recently a sparkling *S.* has been introduced, prepared according to the champagne method.

Savage, James, LL.D., historian and politician, was born at Boston, Massachusetts, July 13, 1784. Graduating at Harvard in 1803, he commenced his law studies in 1807, and subsequently sat in both houses of the Massachusetts legislature, besides filling several municipal posts at Boston. He was for some years the president of the Massachusetts Historical Society, editing several volumes of their *Collections*, and publishing from the original manuscript Wythrop's *History of New England* (1825-26). He also edited Paley's *Works* (5 vols. 1828), contributed various articles historical and political to the *North American Review* and the *New England Magazine*, and wrote a number of pamphlets. His most important work is a *Genealogical Dictionary of the First Settlers of New England, showing Three Generations of those who came before May, 1692* (4 vols. 1862-64), a work which, though deficient in plan and execution, is of great value, and displays much research. *S.* died at Boston, March 8, 1873.

Savage, Richard, born in London, January 10, 1698, was the illegitimate and disowned son of Anne, Countess of Macclesfield, and Richard S., Lord Rivers. Lady Mason, the Countess's mother, sent the boy to school at St. Alban's, and from school he went to the shoemaker's bench till the age of seventeen, bearing the name of Smith. On the discovery of his parentage, Steele, Mrs. Oldfield, and others encouraged him in his attempts as a playwright, and in 1723 he acted in his own *Sir Thomas Overbury*, and gained £200. The publication of a volume of *Miscellanies*, not all by his own hand, increased his reputation and his

means, but habits of dissipation ruined him, and in 1727 he was condemned to death for the murder of a man in a drunken brawl. At the entreaty of the Countess of Hertford, Queen Caroline pardoned him, and no sooner had he escaped from prison than he bitterly attacked his unnatural mother in a poem entitled *The Bastard*. Lord Tyrconnel, his relative, then received him into his house, and allowed him a pension of £200. In 1729 his *Wanderer*, a moral poem, was published. For several years he led a life of pleasure, until a quarrel with Lord Tyrconnel and the death of the queen deprived him of all means of continuing his vicious indulgences. Pope and others kept him for some time at Swansea on an allowance of £50 yearly; but, tired of such solitude, the wretched poet in 1743 started for London with a new play in his pocket. At Bristol he gave way to excesses; he was arrested for a debt of £8, died in jail (July 31), and was buried at the expense of the jailer. His *Collected Works* were published at London in 2 vols. 1775. See Johnson's *Life of S.* (Lond. 1744), in which the reader is taught to pity while condemning a poet who, amid gentler influences, might have left a name for something else than vice.

Savann'ah, or **Savanna's** (Span. *savana*, *sabana*, 'a sheet'), a tract of grassy plain-land, destitute of trees, yielding pasturage in the rainy season, and sometimes covered with a growth of under-shrubs. Savannals are found in the southern states of N. America, and in the interior of S. Africa.

Savann'ah, the boundary river between Georgia and S. Carolina, U.S., is formed by the junction of the Tugalo and Keowee, flows S.E. for 450 miles, and falls at Tybee Roads into the Atlantic. Its drainage area is 8000 sq. miles. It is navigable to the city of S. for vessels drawing 18 feet of water, and by small vessels to Augusta, 231 miles from its mouth. The tide ascends 45 miles, and at S. its mean rise and fall is 6½ inches. Improvements are now (1878) in progress to secure a channel of 22 feet depth from its mouth to S. city.

Savann'ah, the principal city of Georgia, and the second cotton-port of the U.S., is situated on the right bank of the S. river, 18 miles from its mouth and 90 miles S.W. of Charleston by rail. It is the terminus of three important railways, and its harbour has a depth of 26 feet at high and 19 feet at low water. The town is handsomely built. Its chief public buildings are the custom-house and post-office, exchange, police-barracks, theatre, and market. It has thirty churches, an infirmary, three hospitals, and several benevolent and social societies. Three daily and two weekly newspapers are published, one of the latter in German. The principal industrial establishments are a cotton factory, five cotton-presses, a paper-mill, a flour-mill, six iron and brass foundries, and five waggon and carriage factories. *S.* exported in 1877, 434,830 bales of cotton, 298,546 being to foreign ports; 20,533 casks of rice; 92,713 barrels of rosin and 17,977 of spirits; 469,708 cubic feet of timber, and 16,844 metric feet of lumber; while her imports included 2,286,422 lbs. of coffee, valued at \$405,601; 8,427,495 lbs. of salt, valued at \$15,287; guano to the value of \$22,595; molasses, \$22,044; and silver coin to the value of \$29,335. In the same year there entered the harbour 637 vessels of 496,416 tons, and cleared 611 of 487,091 tons; and of the entrances 54 of 51,297 tons were American, 264 of 160,877 tons were foreign, and 319 of 284,242 coastwise; and of the clearances 61 of 41,863 were American, 183 of 105,150 foreign, and 367 of 340,078 coastwise; of British vessels in the direct trade from and to Great Britain and the British Colonies there entered in the same year 85 of 64,648 tons, with cargoes valued at £12,710, and cleared 47 of 33,824 tons, with cargoes estimated at £992,502; while in the indirect or carrying trade in British vessels to and from other countries, there entered 38 vessels of 23,883 tons, and cleared 57 of 42,840 tons, with cargoes worth £336,106. Pop. (1876) estimated at 30,000.

Savary, Anne Jean Marie René, Duc de Rovigo, born at Marcq, near Vouziers, in France, April 26, 1774, was educated at the college of Metz, entered the army at the age of fifteen, and four years later was made a captain. He served under Pichegru on the Moselle, under Desaix in Egypt, and then became aide-de-camp to Bonaparte, who made him successively colonel, brigadier-general, and director of the secret police (1802). He discovered the conspiracy of Cadoudal, and superintended the execution of the Duc d'Enghien. At Austerlitz he

distinguished himself as a general of division; during the Prussian campaign of 1806 he commanded ten regiments of the imperial guard, and while protecting Warsaw against the Russians after the battle of Eylau he gained the splendid victory of Ostrolenka (February 16, 1807), for which he received a pension of 20,000 francs. For his services in the battles of Heilsberg and Friedland the emperor created him Duc de Rovigo. Sent in 1808 into Spain to supersede Murat, he negotiated the arrangement by which the Spanish king and his son were brought within the clutches of Napoleon at Bayonne. In 1810 he took the post of Fouché as minister of police. During the Hundred Days he was made a peer of France, but after Waterloo was confined in Malta for seven months by the British Government. Having made his escape he was landed at Smyrna, and returned to France in 1818. In 1819 he obtained his former rank, but without being called to active service. On December 1, 1831, Louis Philippe appointed him governor of Algiers. He died at Paris, June 2, 1833. S.'s *Mémoires* (8 vols. 1828; Eng. trans. 4 vols. 1828) exhibit the blindest devotion to Napoleon, but are possessed of extreme interest.

Sa'Ve, an important tributary of the Danube, formed by two streams, the one rising N. and the other S. of Mount Terglou in Carniola. They unite at Radmannsdorf, and the river then flows S.E. through Carniola, Styria, and Croatia, passing Laibach and Agram, and receiving on the right the Laibach, Kulpa, Unna, Urbas, Bósna, and Drina, the last the boundary river between Bosnia and Serbia. For 220 miles, *i.e.*, from its receiving the Unna to its joining the Danube at Belgrade, the S. separates the Austrian military frontier from Bosnia and Serbia. At its mouth it is 2132 feet wide. Its total length is 442 miles.

Sav'eloy (said to be a corruption of Savoy), a species of sausage made of chopped and seasoned meat, and sold in a cooked condition ready for eating.

Saviglia'no, a town of N. Italy, province of Cuneo, on the Macra, 10 miles E. of Saluzzo by rail, has several interesting churches, the principal that of Sant' Andrea of the 11th c. The surrounding district produces abundant wheat, maize, fruits, and silk. Pop. (1874) 16,150.

Savigny, Friedrich Karl von, one of the greatest juristic authors of the 19th c., belonged to a French Huguenot family that had settled in Germany. Born at Frankfurt, February 21, 1779, he studied at the University of Marburg, where he held the chair of civil law from 1801 to 1804. Here he produced his masterly exposition of the Roman law of possession, *Das Recht des Besitzes* (1803), and after some years of travel in France and Germany he was appointed professor of law in the University of Landshut (1808), and two years afterwards was called to Berlin. In 1811 he became a member of the Prussian academy of science, entered in council of state in 1817, was appointed minister of justice for the revision of the law in 1842; and in 1848 retired from public life. After a brilliant professional career of nearly forty years, S. died October 25, 1861. He is, if not exactly the first, by far the greatest of the founders of the historic school of jurisprudence—a school which has raised law from a superstition to a science. His chief works are *Vom Berufe unserer Zeit für Gesetzgebung und Rechtswissenschaft* (1815; Eng. trans. Lond. 1831), *Geschichte des Römischen Rechts im Mittelalter* (6 vols. 1826-31; partly trans. into Eng. by Cathcart, Edin. 1829), *System des heutigen Römischen Rechts* (8 vols. 1840-48), *Das Obligationenrecht* (1851-53), and *Vermischte Schriften* (5 vols. 1850). See Rudorff, *Erinnerung an S.* (Weim. 1862), and a Biography by Bethmann-Hollweg (1867).—**Karl Friedrich von S.**, son of the preceding, born 1816, served from 1836 in the diplomatic service of Prussia, and was an influential member of the Reichstage from 1868. He died 11th February 1875.

Savile, Sir Henry, was born at Over Bradley, near Halifax, Yorkshire, November 30, 1549. He studied at Brasenose College, Oxford, and afterwards at Merton College, where he graduated in 1570, and was elected fellow. In 1578 he made a tour on the Continent, and on his return became Greek and mathematical tutor to Queen Elizabeth. In 1596 he was chosen provost of Eton, and in 1604 was knighted by James I. He was warden of Merton College from 1585 to his death, which took place February 19, 1622. His fortune he devoted to the

advancement of learning, founding in 1619 two professorships (in geometry and astronomy) at Oxford, known as the Savilian professorships. His chief works are *Rerum Anglicarum Scriptores post Bedam præcipui* (1596), a folio containing the works of William of Malmesbury, Henry of Huntingdon, Roger Hoveden, &c., *Commentarii de Militia Romana* (1598), and *Praelectiones tredecim in Elementa Euclidis* (1621). He also translated *Four Books of the Histories of Cornelius Tacitus* and *The Life of Agricola* (1581), published a magnificent edition of the complete works of St. Chrysostom in Greek (8 vols. 1613), and edited Bradwardin's *De Causa Dei* (1618).

Savin, a name given to *Juniperus Sabini*, a native of Central Italy and other parts of S. Europe, and of W. Asia. It differs from the Juniper (q. v.) in having leaves only half as long, more spreading, and of a different colour; the fruit also is smaller. The twigs and foliage have a strong odour, and an acrid, bitter, resinous, and disagreeable taste. From them the oil of S. is distilled,—a volatile oil, either colourless or of a pale yellow tinge, upon which the medicinal properties of the plant depends. S. is administered as an emmenagogue, but being poisonous its use demands caution. An ointment of S. made with yellow wax and lard is employed as an irritant to keep up discharges from a blistered surface. S. has been cultivated in Britain for upwards of 300 years. *J. Virginiana*, the American S. or Red Cedar, is a large handsome tree supplying a fragrant timber esteemed for its strength and durability. It yields less volatile oil than the true S.

Savings' Banks, institutions for the deposit of small sums of money, and their accumulation at compound interest, with provision for repayment at short notice. These institutions, so valuable to the poorer classes of the community, are altogether the growth of the last hundred years. The S. B. founded at Hamburg in 1778, and another in Bern in 1787, were wanting in the popular and attractive features of those which subsequently sprang into existence in this country. Francis Masseres proposed in 1771 to invest the ratepayers of any parish with powers to receive and invest savings, and to grant deferred annuities; but a bill to this effect failed to pass through Parliament. The first practical attempts were on a small and tentative scale. A children's bank was started by Mrs. Priscilla Wakefield at Tottenham in 1798. The Rev. J. Smith of Andover, Bucks, along with two friends, agreed in 1799 to receive small sums from his parishioners during the summer, to be returned with one-third bounty at Christmas, a liberal offer which was of course eagerly embraced. The title of 'Father of S. B.' has been given, however, to the Rev. H. Duncan of Ruthwell, Dumfriesshire, who established a savings' bank in 1810 on so successful a basis that in four years it possessed an accumulated fund of £1160. Edinburgh, Bath, Southampton, and Exeter were among the first places to follow the good example, and in the course of a few years imitative institutions were spread all over the country. Acts to encourage the establishment of S. B. in England and Ireland were passed in the year 1817, and empowered the managers to pay the deposits (when they reached £50) into the Bank of England to the credit account of the Commissioners for the reduction of the National Debt, a rate of interest equal to 3d. per day, or £4, 11s. 3d., being given thereupon. The S. B. usually gave 4 per cent. interest to depositors, reserving the difference for expenses of management, and this high rate became an inducement to parties, for whom the institutions were not intended, to open large accounts as simple and productive investments. A new law was accordingly passed in 1824 limiting the amount of deposits to £50 in the first year, and £30 in each subsequent year; £200, including interest, being the largest amount which any deposit was to be permitted to accumulate to. An Act in 1828 required the rules of every savings' bank to be deposited with the clerk of the peace, submitted to a barrister appointed by the National Debt Commissioners, and laid before the justices of the peace. In 1833 power was given to S. B. to grant deferred annuities of small amounts, and in 1835 the statutes of 1828 and 1833 were extended to Scotland, which had previously been omitted from S. B. legislation. Although the rate of interest given by the Commissioners had been reduced in 1828 to 2½d. per day, or £3, 16s. 0½d. per annum, the amount paid in this way by them from 1817 to 1843 resulted in a national loss of over £2,000,000, which induced the further reduction to £3, 5s. in 1844, £3, 10d. being the highest

amount to be paid to depositors. In the same year the responsibilities of depositors on the one hand, and trustees, managers, and actuaries were more clearly defined. The institutions were for the most part conducted in the most honourable manner, considering the opportunities for fraud which existed, but some very disgraceful exceptions to this rule occurred, culminating in the Rochdale Fraud of 1849, when, upon the death of George Howarth, the actuary, a deficiency was discovered amounting to £71,717. The result was that the Government regulations as to book-keeping and audit were more rigidly enforced. S. B. on the old system (*i.e.*, apart from the Post-Office S. B. afterwards alluded to) are now established, with the approval of the barrister appointed by the National Debt Commissioners. The founders elect and duly register the names of the trustees and managers, who are not allowed to receive any remuneration, while the paid officers must give security for their intrusions. The treasurer is not allowed to retain more money than is necessary for current purposes. With these stipulations, and the efficient checks insisted on, the risk of fraud is reduced to a minimum. At the close of the year 1876, 466 'Old S. B.' were in existence in the United Kingdom. See J. Tidd Pratt's *History of S. B.* (1842), and Scratchley's *Practical Treatise on S. B.* (1860).

Although so long ago as 1806 Mr. Whitbread had mooted the scheme of a national Post-Office S. B., it is only within the last twenty years that the development of the system has assumed practical shape. In the year 1859, Mr. Sikes, of the Huddersfield Banking Company, read a paper on the subject at the meeting of the Social Science Congress at Bradford, and a plan based upon his proposals was carried through Parliament by Mr. Gladstone in 1861, and came into operation on the 17th of September of that year. 1629 Post-Office S. B. had been established in England before the 31st December 1861, and in 1862 the Act was extended to Scotland and Ireland. Deposits of 1s., or any number of shillings, are received to the limit of £30 in one year. No further deposit can be made after an account reaches £150, and the account continues to bear interest until it accumulates to £200, when interest ceases. Most people will be of Mr. Gladstone's opinion (expressed in a note to the writer of this article), that the Post-Office S. B. are 'at present unfairly weighted with these limits entirely out of a consideration for the Old S. B., to which the latter have no claim.' The rate of interest is £2, 10s. per annum, complete pounds only being taken into account. The number of Post-Office S. B. in the United Kingdom on 31st December 1876 was 5448. The regulations of these institutions will be found at length in the *British Postal Guide*, a quarterly publication.

The Old S. B. and the Post-Office S. B. have continued to work harmoniously together, and each system appears to offer special advantages on certain points. The rate of interest given by the old banks is usually (sometimes considerably) more than that given by the Post-Office banks, and is given on fractions as well as complete pounds. Withdrawal of deposits can be made at once from the old banks if the amount be small, while in the case of the Post-Office application must be made to the Postmaster-General, who sends an authority to the bank where the account lies. On the other hand, while most of the old banks are only open during certain days in the week, the Post-Office banks are open every day, and the security offered by them must be looked upon as practically more perfect.

A useful outcome of the S. B. system has been the establishment of *Penny Banks*, where a single penny can be deposited. These humble institutions, set in motion by parochial authorities, schools, &c., have been useful and successful in their work among the poorest sections of the community.

S. B. are established for the army in connection with every regimental pay department, for setting aside a portion of the soldier's pay at his discretion at a definite rate of interest, and for the sailors of the Royal Navy in connection with the Admiralty. For the receipt of the savings of seamen of the mercantile marine there is a central office in London, with branches at the chief outposts. The statistics of these institutions are unimportant and somewhat misleading, as many soldiers and sailors invest their savings in the ordinary banks.

Statistics.—(1) *Old S. B.*—The following table shows the number of depositors and amounts deposited in each year, at

intervals of five years from the passing of the first Act regarding S. B. in 1817.

Year.	No. of Depositors.	Amount Deposited.
1817	9291*	£231,028
1822	204,584*	6,546,690
1827	395,000*	14,188,708
1832	440,861	14,416,889
1837	636,339	19,711,797
1842	857,086	25,406,642
1847	1,096,086	30,236,632
1852	1,209,934	31,912,413
1857	1,366,500	35,255,722
1862	1,558,189	40,809,578
1867	1,385,782	36,792,912
1872	1,463,560	40,000,462

* Partly estimated.

The number and amount of accounts open in the Old S. B. in the different parts of the United Kingdom on 20th November 1876 were as follows:—

	No. of Accounts.	Amount owing to Depositors.
England and Wales	1,133,119	£34,918,077
Scotland	260,810	5,697,649
Ireland	56,849	2,178,266
Islands	22,623	489,706
	1,493,401	£43,283,698

Under the provisions of 26 Vict. c. 14, 191 ordinary S. B. had closed up to 20th November 1876, and transferred accounts to Post-Office S. B. to the extent of £2,602,371.

(2) *Post-Office S. B.*—The number and amount of accounts open in the Post-Office S. B., on 31st December 1865, 1871, and 1876 is as follows:—

	No. of Post-Office Savings Banks.	No. of Accounts.	Amount owing to Depositors.
31st Dec. 1865	3321	611,384	£6,526,400
31st Dec. 1871	4335	1,303,492	17,025,004
31st Dec. 1876	5448	1,702,347	26,996,550

Foreign S. B.—The first savings bank in France was organised on the English model in 1818. In that country S. B. are under the surveillance of the State, and their funds are deposited in the *Caisse des Dépôts et Consignations*, the interest being paid by the public treasury. In 1870 the amount deposited in French S. B. was £28,800,000, which fell after the war to £20,600,000, but it has lately increased with extraordinary rapidity, being stated to be no less than £32,000,000 in 1876. The increase is partly attributed to the great development of school S. B. all over the country. Under powers granted by a legislative enactment passed in 1876, the old-established S. B. were making use of 300 post-offices for their operations. In Switzerland and Belgium S. B. have been very successful. In Switzerland in 1874 the deposits were estimated at £11,000,000; while in Belgium, where since 1870 S. B. have been established at the post-offices without any arrangements, however, for cross transactions, the progress has been most marked. In Austria, Germany, Italy, Sweden, and even in Russia, S. B. have become popular institutions. The Postal Receiving Houses of Berlin are now used for savings bank business. In Holland, on 1st May 1876, 1255 post-offices were placed at the disposal of the private S. B. In Italy a complete system of post-office S. B. on the English basis, with arrangements for cross transactions, was established in 1875. The number of such banks in February 1876 was 2144. Throughout Europe the deposits in 1874 were estimated at £236,000,000. The first savings bank in America was established at Philadelphia in 1816. The deposits in the United States, at the end of 1874, so far as could be ascertained from available statistics, were \$348,292,894, but the real amount was probably not less than \$1,000,000,000. The interest given in America is usually 6 per cent., but sometimes reaches 8 or 9 per cent. On July 1, 1877, the deposits in the New York S. B. amounted to \$181,267,019.

Savona, a seaport of N. Italy, province of Genoa, on the Riviera, 20 miles S.W. of the city of Genoa by rail. It is beautifully situated among lemon and orange gardens, has a cathe-

dral (1604) with some good pictures, and a theatre (1853) dedicated to the poet Chiabrera, who was a native of the place. A line of rail from the main station to the harbour was opened in April 1877. S. carries on an active trade in olives, fruits, grain, wood, and wines. In 1876 there entered the port 72 British vessels of 44,187 tons. In the same year the total import of coal amounted to 70,000 tons, and there were also some imports of iron for the local foundries. S. has also an extensive manufacture of pottery. It was the birthplace of Popes Sixtus IV. and Julius II. Pop. (1876) 26,024.

Savonarola, Girolamo, an illustrious Italian preacher and politician, born at Ferrara, September 21, 1452, was educated in his earlier years for the medical profession, but at the age of seventeen entered a Dominican monastery at Bologna, and after a course of theological studies was sent to Florence, there to deliver lectures to the novices, and to preach. But his voice was harsh, his manner was stiff, and his matter so little adapted to a common audience that hearers deserted him, and he retired in mortification from Florence. At Brescia he gave himself to the exposition of Scripture among the members of his own order, and one day having spoken at a Dominican chapter held at Reggio, he so impressed young Pico della Mirandola, that this gay courtier constrained Lorenzo de' Medici to recall the *frate* to Florence. In 1489 he returned to the convent of San Marco, and ere long his voice was once more raised in its pulpit. Already he was the mystic and the reformer; in his retirement he had been delivering strange political lectures on the Apocalypse; and in his first sermon in Florence he taught—'(1) that the Church of God required renewal, and that immediately; (2) that all Italy should be chastised; (3) that this should come to pass soon.' This was the fitting preface to his life's work. He was the patriot even before the priest. In Florence he found an epitome of Italy. There he saw genius rioting with sin, the noblest art and the foulest morals; a revival of learning, but the death of freedom; and he determined to make Florence a New Jerusalem, from which should go forth another gospel—the gospel of Italy's salvation. He became, therefore, the great rival of the despot Lorenzo de' Medici: the one strove to inflame the spirit of the Florentines, the other strove to enchain their senses. For a while S. appeared to conquer. The noblest men joined his sect of Weepers—*Fragnoni*; much of the most beautiful and most licentious in the new art and literature was brought to his feet and reduced to ashes; women and even children crowded the entrance to his chapel at midnight, when it was known he would preach on the following day. His burning enthusiasm might have produced a reformation had reason continued to regulate it; but he fell from the stern moralist into the political demagogue, and incurred the suspicion of his own supporters, by professing to work miracles, and claiming supernatural protection which a public trial did not substantiate. Once, at least, he saved the city from ruin—in the anarchy consequent on the banishment of Piero de' Medici. He organised the Great Council, and thus bridled the desires of those individuals bent on their own aggrandisement. He protected the citizens by establishing the right of appeal to the Signory. He also brought about a truce between all factions. He was the one man in Florence who could have accomplished this. But his own extravagant pretensions worked him more harm than the plotting of enemies. In 1495 he was summoned to Rome as a heretic, and failing to appear, was forbidden to preach. Two years after this a sentence of excommunication was passed on him. Still he continued to defy the powers of both Pope and Medici; but the partisans of the latter, the Arrabbiati, gained the ascendancy in 1498, and had him tried for misleading the citizens by false prophecies. He is said to have made a partial confession of guilt; but the authority for this assertion is not strong. More probably he had deceived himself as well as the populace. Judgment was given against him (by his enemies) as a seditious heretic. Rome approved the sentence, and on the 23d of May 1498, he and two disciples, Domenico da Pescia and Silvestro Maruffi, were executed and burned. The testimony of the earliest and the most recent historians shows S. to have been a man of the noblest aims and the most saintly life. There is no passage in history more interesting than that in which this eager, impassioned, uncouth priest is seen wrestling in a brilliant court with a brilliant prince, who is backed by such powers and such genius as gold never before gathered together.

It was the fiercest combat that ever the spirit and the flesh fought; and in spite of apocalyptic extravagancies that fatally misled S., the sympathies of men are with him and not with the lettered heathens of Florence. He wrote both in Latin and Italian, and his chief works are—*Compendium Logice* (Pisa, 1492); *De Divisione Omnium Scientiarum*; *Tractato circa el Reggimento e Governo della Città di Firenze*; *La Examina de Peccati d'ogni Peccatore* (Flor. 1495); *Trattati due diversi dell' Orazione* (1495); *De Simplicitate Vita Christiana* (1495); *Della Vita Vituale* (1496); *Compendio di Revelatione* (1495-96); *Revelatio de Tribulationibus nostrorum Temporum* (Par. 1496); *Triumphus Crucis de Veritate Fidei* (Flor. 1497); *Solatium Itineris mei, Dialogus* (Venice, 1528). A collection of S.'s works, chiefly those of a philosophic and ascetic kind, was published at Lyon (6 vols. 1633-40). See the faithful narrative of S.'s friend, Burlamacchi's *Vita di G. S.* (Flor. 1764); Madden's *Life of S.* (2 vols. 1854); Rever's *I Fragnoni e gli Arrabbiati al Tempo de S.* (2 vols. Milan, 1843); Trollope's *History of the Commonwealth of Florence* (4th vol. 1865); and more especially Perrens' *Frôme Savonarole, sa vie, ses Predications, ses Ecrits* (Par. 2 vols. 1853; 3d ed. 1859), and Pasquale Villari's *Storia di S.* (Flor. 2 vols. 1859; Eng. trans. by Horner, 1863).

Savory (*Satureja*) is a genus of *Labiata*, of which two species—*S. montana* and *S. hortensis*—have long been appreciated as aromatic herbs. Both are natives of countries around the Mediterranean, and were in use amongst the Romans. The first, a perennial herb, commonly called Winter S., is cultivated in kitchen gardens for its tender tops, as a seasoning for soups and made dishes, and for boiling with pease, beans, &c.; but it is surpassed in agreeable fragrance by the second, an annual species, known as Summer S. Another Mediterranean species named *S. Thymbra* has a thyme-like flavour.

Sav'oy, one of the numerous forms of the cabbage (*Brassica oleracea*), to which the name *bullata major* has been given. Except in its wrinkled leaves, it resembles the common cabbage. It is chiefly used in winter after being mellowed by frost.

Sav'oy (Ital. *Savoja*, Fr. *Savoie*), the cradle of the Italian monarchy, is a mountainous region, occupied in the E. by the Graian, in the N.E. by the Pennine, in the W. by the Cottian Alps, and watered by the Isère, Arve, and Arcq. At the Peace of Villafranca, July 11, 1860, it was transferred by a 'plebiscite' to France, and now forms the departments of *Savoie Haute* (q. v.) and *Savoie Basse* (q. v.). The Savoyards, who are noted for their industry, thriftiness, and honesty, annually leave their native valleys in great numbers to earn a livelihood in richer lands, but never permanently emigrate.

S., originally belonging to Gaul, became part of the first kingdom of the Burgundians in 435, of the Frankish kingdom in 534, of the kingdom of Arles (the second kingdom of the Burgundians) in 879, and passed with it to Germany in 1038. The lords of S. were vassals of the empire. The founder of the House of S. was Count Humberto, who died in 1048. Under Amadeo I. (died 1072), Susa, Aosta, and Turin were acquired. In 1111 the possessions of the House were made an imperial county. Count Tommaso I. (died 1233) added to these the town of Chambéry and the country of Vaud. Amadeo III. (died 1253) became Duke of Chablais and Aosta. In 1416 S. itself was made a duchy of the empire by Sigismund, and its ruler, Amadeo VIII. (see AMADEUS), was chosen regent of Piedmont on the extinction of the native line. His son Luigi (died 1465) married Annas of Lusignan, daughter of Joannes II., King of Cyprus. In 1485 Queen Charlotte of Cyprus declared Carlo (died 1489) her heir, and ever since the rulers of S. have borne the titles of Kings of Cyprus and Jerusalem. The reign of Carlo III. (died 1553) was most disastrous. He lost the Valais and Geneva (1533), the country of Vaud (1536), and two years later the rest of his possessions was divided between the Emperor and the King of France. But in 1564 the duchy was restored to Filiberto Emanuele. In 1576 the Principality of Oneglia and the county of Tenda were acquired. But later on Carlo Emanuele I. (died 1630) was compelled to surrender Pignerol and other strongholds to the French. His sons were Vittorio Amadeo I. (died 1637), and Tommaso, founder of the line of Savoy-Carignan. In 1720, under Vittorio Amadeo (q. v.), the Dukes of S. became Kings of Sardinia, which continued to be the title of the house till March 1861, when

it was exchanged for the grander title of Kings of Italy. See Cibrario, *Storia dell Monarchia de Savoia* (3 vols. 1840-47).

Savoy, The, a district off the Strand, London. The Palace of the S. was built in 1245 by Peter, Earl of S. and Richmond. It afterwards came into the possession of John of Gaunt, and in it King John of France was confined after his capture by the Black Prince at the battle of Poitiers (1356). It was burnt in Wat Tyler's Insurrection (1381), and was not rebuilt till the close of the reign of Henry VII., when it became an hospital 'to harbour 100 poor people' (1505). In the reign of Edward VI. this establishment was suppressed, but was revived in the reign of Mary. Under Elizabeth the S. became a parish, with the chapel of the palace as its parish church. The hospital existed until the reign of Anne, when it was finally suppressed, and the palace fell into ruins. All remains of it, except the chapel of the S., were swept away when Waterloo Bridge was commenced in 1811. The chapel was burnt down in 1864, but was restored at the expense of the Queen, and reopened in 1865.

Savoy Conference.—On the Restoration of Charles II., 1660, the Church of England was immediately restored to her former position. But as the moderate Puritans had no inconsiderable share in bringing the king back, they were at first treated with much courtesy. Charles repeatedly declared that he desired all good men and loyal subjects should be included in the National Church. Accordingly a conference was arranged in 1661, ostensibly to effect a compromise between the Puritans, now called Presbyterians, and the Church party. Twelve bishops and nine other clergymen were summoned to meet the same number of Presbyterian clergymen in the Savoy Palace, from which their meeting has got the name of the S. C. The leader on the one side was Sheldon, Bishop of London, and on the other, Richard Baxter. An attempt was made to revise the Book of Common Prayer, but it was left upon the whole more objectionable to the Presbyterians than before. After four months' argumentation the conference broke up, having done nothing but embittered the differences between the two parties: and next year the Act of Uniformity (q. v.) was passed. See Burnet's *Hist. of his Own Time*. Messrs. Macmillan & Co. are about to issue *The Memorials of the S.* (September 1878).

Saw, an instrument consisting of a blade, band, or disc of thin steel, with a serrated or indented edge, used for cutting wood. The S. is an implement of great antiquity—a kind being found among flint implements; and it is the most important and useful of all wood-working machinery. Saws may be divided into two classes,—hand-tools and machine-tools. The most common are the hand-saws, of which there are many varieties, according to the class of wood and the kind of work for which they are employed. The common hand-S., used for cutting pine and similar soft wood, is a long blade broader at one end than at the other, and having a wooden handle secured to the broad end. For ripping or longitudinal cutting it is made larger, with deeper-cut and finer-set teeth than for cross-cutting. The compass- or post-S. has a narrow blade tapering to a fine point, which is used for entering and cutting small holes. The tenon-S. has a very thin oblong blade, with fine small teeth, and its back is strengthened with a band of brass or iron. The bow-S. consists of a narrow steel ribbon attached at both ends to a frame of wood, and kept in position by tension applied to the frame, and the fret-S. is a ribbon similarly mounted in a metal frame. Two-handled saws are large heavy blades, with deep teeth variously cut and set, used for felling timber, for cross-cutting trunks, and other heavy work. Machine-saws are now adapted and extensively used for all the purposes to which hand saws can be applied. The machine-saws are comprehended under three different classes—circular-, reciprocating-, and band-saws, the last being of comparatively recent origin, but now much employed. The circular-S. is used chiefly in saw-mills for cutting up logs into boards and other forms. The teeth of the circular-S. are deep cut, and the S. itself is made to revolve with great rapidity and force, while the log is pushed forward against it by means of a travelling platform. The variety of teeth used in circular saws is illustrated in the accompanying figure, the outer and larger showing five different cuts, and eight kinds of teeth are represented on the smaller S. The reciprocating-S. works like a two-handled hand-S., but it is fixed and the wood is carried forward against its teeth. Usually a series of such saws are mounted in one frame, at such intervals from each other as are

required for the size of the boards or planks to be cut out of the log. Some reciprocating-saws for cutting frets and minute work

consist of ribbons, one of the ends of which are attached to a strong spring by which they are strained and kept in position. The band-S. consists essentially of two wheels, over which a thin endless ribbon-S. is placed like a belt, and is strained on them. The ribbon passes down through a flat sawing-table, upon which the material to be cut is laid. The ribbon-S. is capable of being adapted for very many purposes, and is rapidly coming into extensive use. Special forms of saws are employed for cutting the exceedingly thin slices of wood termed veneers.

Sawdust, or wood waste produced by sawing, has many uses in the arts. The chief of these is in the manufacture of oxalic acid, by the process of Messrs. Roberts, Dale, and Pritchard, patented in 1856. Jewellers use boxwood-S. for drying articles that have been washed, and the waste of cedar and mahogany is employed in the dressing of furs. The dust of hard ornamental woods, as rosewood and ebony, was utilised in France some years ago in forming, together with bullock's blood and other ingredients, a composition that was easily moulded, and was known as *bois durci*. S., impregnated with saline matters by steeping, is also useful for placing between the double walls in fire-proof safes. In times of scarcity, S. of beech or other non-resinous wood is eaten in Sweden and Norway. It is prepared for this purpose by repeatedly macerating and boiling it in water, and drying in an oven, and when ground it tastes and smells like corn-flour. S. has many other minor uses, as for stuffing, packing goods, cleaning floors; and it is mixed with tar to be used as fuel.

Sawfish (*Pristis antiquorum*), a species of fish allied to the shark and ray, and belonging to the order *Elasmobranchii* (q. v.). It is notable for the immense and peculiar development of the snout, which forms a flattened blade-like structure, armed at the sides with sharp and strong spines giving the snout the appearance of a coarse saw. The 'saw' may attain a length of from 2 to 3 feet, the fish itself measuring from 8 or 9 to 12 or even 18 feet. The mouth is placed on the under surface of the head, and the breathing apertures are large. The colour is a greyish-black above and white beneath. The animal seems to use its peculiar weapon to attack other fish; even whales are said to be sometimes killed by it. The S.-f. occurs in the Mediterranean Sea and in the Atlantic. An allied species is the *Pristiophorus cirratus*.

Sawfly, the general name applied to *Hymenopterous* insects belonging to the family *Tenthredinida*, in which the head is broad, and the wings wide. The antennæ are usually short and simple, but may be clavate. The *ovipositor* or 'saw' is composed of two long plates or *lamellæ*. By the protrusion of this

organ, which is toothed on the upper surface, the insect is enabled to saw or incise the leaf fissures, and therein deposit its eggs. The eggs grow within the leaf. Of the S. the best known species belong to the genus *Nematus*. *N. grossularia*, or Gooseberry Fly, deposits its eggs in masses or strings on the surface of the leaves of the gooseberry shrub. *N. conjugatus* is another species which lays its eggs near the edges of leaves. The genus *Cephus*, of which the Corn S.-F. (*C. pygmaeus*) is a good example, destroys wheat by boring into the stems. Another genus is *Pristiphora*, allied to *Nematus*; and the Turnip Fly is the *Athalia centifolia*, whose larvæ are named 'Niggers' on account of their black colour.

Saw-Mill, a mill where timber is sawn by reciprocating, rotary, and band-saws (see SAW), driven by steam, water, or wind; the term is also applied to the machinery itself. A S.-M. driven by water is said, on the authority of Ausonius, to have been erected on the River Roer, in Germany, as early as the 4th c. Nothing is known of the existence of saw-mills during the subsequent dark ages down to 1332, when they were certainly in operation near Augsburg. The Spaniards erected them in Madeira in 1420; Breslau had them seven years later, and Erfurt in 1490. During the next c. saw-mills were established in Norway, Holland, and other European countries, and to this period is assigned the introduction of a S.-M. having a gang of saws capable of cutting a log into many planks simultaneously. The first S.-M. erected in England in the 17th c. had to be abandoned in consequence of the violent opposition offered by the operatives, and not till the following century were they firmly established. Among the earliest were those of Leith in Scotland and Limehouse in England, both driven by wind. They have been greatly improved in America, where an immense timber-trade necessitates their extensive use. Special forms of the S.-M. have been invented for sawing shingles, clapboards, laths, &c., and also for cutting out mouldings, furniture-stock, veneers, &c. Jig, scroll, and belt saws are employed for work of this kind.

Sáwánt Wári, or **Sunder** ('the beautiful'), the capital of a native state of the same name, in political connection with the Bombay government, India, 28 miles W. by N. of Belgaum. Pop. (1872) 8017. It is said to well deserve its name of beautiful. The state of S. W. lies between the British district of Rutnagherry and the Portuguese settlement of Goa, and is cut off from the Indian Ocean by a narrow strip of land ceded to the British in 1812. Area, about 900 sq. miles; pop. (1872) 190,814, of whom 4000 are Roman Catholics; revenue, £30,000. The inhabitants, who are Mahrattas, furnish many recruits to the Bombay infantry. The country lies among the ridges of the W. Ghats. The staple crop is rice; oil-seeds, fruit trees, and pepper are also grown, and coffee would flourish. The forests are very valuable. Much cotton is carried along a new road from the interior.

Saxe, a French form of the German *Sachsen* (q. v.).

Saxe, Marshal. See MORITZ, GRAF VON SACHSEN.

Saxifrage (Lat. *saxum*, 'rock,' and *frango*, 'I break,' from the species rooting into rocks and disintegrating them) is the type genus of the natural order *Saxifragaceæ*, and consists of about 180 species, distributed through the N. and S. temperate and arctic zones; but absent in S. Africa, Australia, and the Pacific. Amongst the best known representatives are *S. umbrosa*—the London Pride—and its numerous allied species and varieties, of common cultivation in gardens; a large series of pretty alpine species (*S. oppositifolia*, the dactyloid series, &c.), and a group of the *S. Aizoon* section, which have been introduced with success into rock-gardens; and of low land species *S. granulata*, with bulb-roots and pretty white flowers. *S. stellaris* has proved to be the highest flowering-plant of the

Saxifraga umbrosa.

British flora, attaining the summit of Ben Nevis, or 4406 feet. The order *Saxifragaceæ*, as at present established, includes the plants formerly classed under *Grossulacææ* and *Philadelphacææ*,

thereby now embracing upwards of 700 species of trees, shrubs, and herbs. The most important or interesting genera are—*Astilbe*, *Cephalotus*, *Chrysophyllum* (q. v.), *Cunonia*, *Deutscia* (q. v.), *Escallonia*, *Hotcia*, *Hydrangea* (q. v.), *Parnassia* (see GRASS OF PARNASSUS), *Philadelphus*, *Ribes* (see GOOSEBERRY and CURRANT), *Weinmannia*. Burnet S. and Meadow S. are English names for umbelliferous plants of the genera, *Pimpinella* and *Silanus*.

Sax'o Grammat'ious, the 'father of Danish history,' flourished in the latter half of the 12th c. Little is known of him save that he belonged to the noble house of Lange, that his father and grandfather served under Valdemar I., and that he lived at Roeskilde, where he died and was buried about 1204. The elegance and fluency of his Latinity, so rare in that age, won for him the surname of *Grammaticus* (i.e., 'the learned'). Encouraged by Absalon, Archbishop of Lund, he wrote his famous *Historia Danica*, which goes back even to the mythical Dan and Angul. The first nine books are, he says, written from old songs and stories, runic inscriptions, and Icelandic records. Though but fabulous history, they shed no little light on the life of the ancient Danes. From the tenth to the sixteenth and last book, i.e., from the 10th c. to 1186, S.'s work may be called history, but it is evident that he spared himself the trouble of consulting the archives of Lund and Roeskilde. In the reign of Valdemar I., however, in which his patron Absalon had been prominent, the details given may be held authentic. S.'s authority, long high, was first attacked in the 17th c. by Torfæus, but especially suffered from the critical analysis of Dahlmann in his *Forschungen auf dem Gebiete der Geschichte* (vol. i. Altona 1822), and from P. E. Müller's *Kritische Untersuchung der Sagen-geschichte Dänemarks und Norwegens* (Copenh. 1823), a masterpiece of historical criticism. The *editio princeps* of S.'s work is entitled *Danorum regum heroumque historia* (Par. 1514; later reprints, Basel 1534; Frankf. 1576; with a commentary by Stephanus (Sorø 1644, and Leips. 1771). The most valuable edition is that of P. E. Müller, completed by J. M. Velschow (2 parts in 3 vols. Copenh. 1839-58). Danish translations have been published by Vedel (ib. 1575 and 1610; new ed. by Wegener, ib. 1845-51.), and by Grundvig (3 vols. ib. 1818-22).

Saxon Architecture. See ROMANESQUE STYLE.

Saxons (Lat. *Saxones*, Ger. *Sachsen*, from *sahs* or *sachs*, 'a knife or short sword,' originally, perhaps, a stone weapon), a German tribe mentioned by Ptolemy as occupying the districts round the mouth of the Elbe. Towards the end of the 3d c., a 'Saxon confederacy' appears in N.W. Germany. In the reigns of the emperors Julian and Valentinian, along with the Franks they made inroads into Roman territory. It is clear that even in Britain they were well known before the traditional date of the invasion of the so-called 'Anglo-Saxons' (q. v.), while on the coast of Normandy and Brittany in the 5th c. they settled in such numbers as to gain for it the name of *littus Saxonicum*. Those who remained in Germany, sometimes called the *Alt-Sachsen*, spread towards the S. and E., along the Elbe and the Weser, until they had overrun the region of the Harz, Thüringen, and most of the present Sachsen. Many of their earlier marauding and conquering expeditions were carried out in conjunction with the Franks, but after the 8th c. the former allies were almost perpetually at war. At last in 804 the Saxon leader Widukind was finally subdued by Karl the Great, but his descendants are supposed to have become 'dukes of the empire.' The sole literary relic of the Old-Saxon language is a poem of the 9th c. called the *Heliand* (i.e., 'Healer' or 'Saviour'); supposed to be a fragment of a larger work embracing the whole of Bible history, executed by an unknown poet at the instance of Karl the Great's son, Hludwig the Pious (see HELIAND). A collection of old Saxon laws was made during the reign of Karl the Great, under the title of *Lex Saxonum*.

Saxony (Ger. *Sachsen*), a kingdom of Germany, in respect of population the third, and in respect of area the fifth among the states of the empire. In outline it is roughly triangular, and it is bounded N. by the Prussian provinces of Sachsen and Schlesien, W. by Sachsen, Altenburg, Weimar, Reuss, and Bayern, and S. by Böhmen. Area, 5785 sq. miles; pop. (1875) 2,760,586.

General Aspect.—S. has only a natural boundary where it is separated from Böhmen by the range of the Erzgebirge and Lausitzergebirge, extending from S.W. to N.E. In the N. and

E. the country is a well-cultivated plain of great fertility. The prevailing rocks are gneiss and mica-schist, occasionally erupted with basalt, granite, and porphyry. The southern range, which is wild and precipitous on the Bohemian side, sinks more gradually towards the N., and is grooved by many a picturesque water-course. In the centre and S.W. are the most elevated parts of the range, the greatest height of which, the Keilberg (1240 metres), lies within the Bohemian frontier. In S. the highest points are the Fichtelberg (1213 metres), Eifenberg (1029 metres), and Eibenstock (1017 metres). The undulating W. part of the range, marked by clay and mica formations, is often spoken of independently as the Elster or Vogtländischen Gebirge. In the N.E. the Erzgebirge descend to the plateau of the Elbsandsteingebirge, and here the Meissener Hochland, known since the last century as the Saxon Switzerland (Sächs-Schweiz), extends N. for about 25 miles from the frontier to within some 10 miles of Dresden, and from the Falkenberg E. to the Schneeberg about the same distance. The Elbe winds through this romantic region of wild woody gorges and abrupt, castellated peaks. The soft sandstone of the plateau is deeply denuded in all directions by the torrents and streams which force a passage to the Elbe, and here and there the rock is worn and scarped into strangely grotesque shapes. The finest of the singular peaks of the region is the Bastei, which rises precipitously 700 feet above the Elbe. One of the most striking of the ravines is the Uttewalder Grund, the sides of which in some places exclude the sun's rays. Besides the Bastei, the Königstein (864 feet above the sea), Lilienstein (1254 feet), and Nonnenstein (700 feet), are all remarkable on account of their curious structure, and of their interesting legends. Several of the fantastic peaks are crowned with Gothic castles, and of these Königstein is one of the few virgin strongholds in Europe. The great part of S. lies in the basin of the Elbe, which is navigable beyond the Bohemian frontier, and flows from S.E. to N.W. for a distance within the kingdom of 76 miles. On the right are its tributaries, the Wesenitz, Black Elster, and Spree, and on the left the Muglitz, Wilde-Weisseritz, Trubsch, Mulde, and White Elster. A small part in the extreme E. is watered by the Neisse, an affluent of the Oder. The climate is rigorous only among the southern hills. From 1866 to 1875 the mean annual temperature at Leipzig was 47.3° F., and at Dresden 48° F.

Natural Products.—S. is one of the most productive of the German states. Except along the mountain frontier, the only forest of great extent is the Hubertusburger Wald. The principal trees are pine, beech, oak, birch, and alder. The yield of timber and firewood yearly amounts to £450,000. The vine culture is only successful on the sunny right bank of the Elbe. The annual production of wheat amounts to 5,235,000 bushels, of rye to 10,276,000, of barley to 4,638,000, and of oats to 13,755,000 bushels. Other products are potatoes (37,415,000 bushels), cole-rape, buckwheat, maize, flax, vegetables, and some tobacco. S. among the German states is pre-eminent for cattle-rearing, and in 1873 had 647,074 head of horned cattle, 206,830 sheep, 301,091 swine, 115,667 horses, and 105,401 goats. There were also 64,283 bee-hives. Large game is almost confined to the mountains, and the fish in the Elbe has recently been much reduced in quantity. Mining is chiefly carried on in the Erzgebirge ('metal mountains'), so named on account of their valuable deposits of ore. The minerals include silver, gold, lead, zinc, iron, cobalt, bismuth, antimony, sulphur, arsenic, &c. In 1874 there were 311 metal-mines in operation, employing 7366 men, and the yield amounted in value to £268,813. There were 92 mines for real coal and 166 for lignite. The former employed 606 officials and 16,693 hands, the latter 154 officials and 3251 hands. The production of real coal amounted to 105,649,500 bushels (value £1,938,108), and of lignite 24,394,340 (value £106,781). As in Lower Silesia, the coal produced is almost entirely used in the working of local spinning-mills and weaving establishments. In the Sachs-Schweiz, on both banks of the Elbe, there were in 1875 as many as 391 quarries in operation, employing 3203 men, and producing sandstone to the value of £157,410. Other minerals are porphyry, kaolin, chalk, and various precious stones, including sapphire, amethyst, chalcedony, topaz, and agate.

Industries.—The textile industries received an immense impulse in the first half of the present century. During the ten years ending 1844 the number of cotton spindles increased from 375,000 to 500,000 (cotton cloth looms to 30,000), that of woollen

spindles from 44,000 to 140,000 (woollen looms to 8000), and that of cotton hosiery looms from 18,000 to 22,000. (See a valuable *Report on S. and the Zollverein*, by Baron Tauchnitz, British Consul-General, May 1873). The cotton industry is the most important, and its chief seat is Chemnitz. In the well-watered valleys of this region are also the principal woollen factories, many of them colossal establishments. The linen manufacture is still carried on to a great extent by means of hand-looms. Flax-spinning gives occupation in winter to many peasant households, while lace-making employs every woman and child in the Ober Erzgebirge, each village having at least one school for training in this specialty. The goods chiefly manufactured are mixed cottons, broadcloths, silks, muslins, orleans, furniture-damasks, cassinets, pattern stuffs, waistcoat pieces, and fine shirtings. The spinning of yarn is carried on in 250 mills with 850,000 spindles, but S. is a great market for English yarns. There are large bleaching and dyeing works; also extensive smelting works, rolling-mills, and engineering establishments. S. does not, however, produce more than one-fifth of its necessary supply of iron and iron wares. Other manufactures are paper (70 mills), pottery, and porcelain (at Meissen), pianofortes and other musical instruments (Dresden and Leipzig), tobacco (5,000,000 cigars), and beer (690 breweries). Leipzig (q. v.) is the centre of the German publishing trade, and next to Hamburg the most important commercial city in the empire. The three annual fairs held here bring to S. an immense amount of transit trade. The foreign manufactured goods imported into Leipzig in 1876 amounted to 409,301 cwts., while those of the Zollverein States amounted to 364,699 cwts. In 1875 S. had 19 steamers and 421 sailing-vessels on the Elbe, and 1260 miles of railway. The chief towns are Dresden (the capital), Leipzig, Chemnitz, Zwickau, Plauen, Freiberg, Glauchau, and Meerane.

Religion and Education.—Although the royal family belong to the Church of Rome, the great majority of the inhabitants (2,674,192) are Protestants. There are in all 2,664,341 Lutherans, 9851 Reformed, 73,349 Roman Catholics, 1876 German Catholics, 5360 Jews, 713 Anglicans, and 4077 adherents of various sects. Education is in a high state of efficiency, attendance at school having been enforced since 1835. In 1875 there were 2116 *Volkschulen* (40 Roman Catholic), with 441,393 pupils and 5015 teachers. In 1876 S. had 20 teachers' seminaries (with over 2000 students), 25 *Realschulen*, 13 gymnasias, and many technical schools and academies. The university of Leipzig, the most numerous attended in Germany, had, in 1877-78, 3036 students and 158 professors and teachers.

Constitution and Finance.—According to the constitution of 1831, modified by a law as late as 1874, the government is a monarchy, hereditary in the female on the extinction of the male line. The legislative power is vested in the king and a parliament, which consists of two chambers. A vote for the Lower House is the right of all men over twenty-five years who pay rates. The revenue and expenditure were each £6,819,044 in the budget for 1877. The former is derived in great part from domains and state railways, while the latter is chiefly the interest on the public debt, the principal of which amounted to £17,044,402. S. sends 4 members to the *Bundesrath* of the empire, and 23 to the *Reichstag*. It furnishes the 12th corps of 67,600 men to the imperial army.

History.—For the origin of the Saxon name and the early history of the people, see the article SAXONS. The last German people to maintain independence of the Frankish yoke, they were only subdued and Christianised by Karl the Great after a war of thirty years (772-804). The line of Widukind, the last chief of the Saxons, is said to have been continued in Ludolf, who was created first duke of S. by Hludwig 'the German' in 850. The son of Ludolf, Otto the Illustrious (880-912), acquired great fame in the wars with the piratical Northmen. On the extinction of the Karolings he was offered and declined the German crown, but his son, the Duke Heinrich (912-36), succeeded Konrad I. of Franconia, and founded the Saxon line of German kings, which terminated on the death of Heinrich II. in 1024 (see GERMANY). He founded the marks of Brandenburg (q. v.), Meissen, and Lausitz, as defences against the encroachments of the Slavic Serbs. Otto I., the first of the Saxon emperors, made over the dukedom of S. to Hermann Billung in 960. The House of Billung acquired Thuringen (q. v.), Anhalt, Slesvig, &c., until the wide tract of S. extended from the Unstrut to the Eider, and from

Pommern to the Rhine. In 1106 the family became extinct, and the duchy passed to Lothar of Supplinburg. Lothar became king of Germany in 1125, and conferred S. on his son-in-law, Duke Heinrich the Proud of Bavaria, who thus was made ruler of the greater part of Germany. His son, Heinrich the Lion, further enlarged the dominion, but when he was placed by Friedrich I. under the imperial ban (1180), the two duchies of S. and Bavaria were partitioned among Bernhard of Ascania, Philipp, Archbishop of Köln, Otto of Wittelsbach, and others. Bernhard, the youngest son of Albrecht the Bear, received the reduced duchy of S., which was further diminished by the erection of Anhalt into a separate principality in 1211. In 1260 the House of Ascania branched into two lines, and divided the duchy into two portions, Sachsen-Wittenberg and Sachsen-Lauenburg. The electoral dignity was confirmed to the latter by the Golden Bull (q. v.), and on the extinction of the Ascanian line in 1423, the Emperor Sigismund disposed by purchase of Sachsen-Wittenberg to Friedrich the Warlike, the powerful Markgraf of Meissen and Landgraf of Thüringen. Friedrich belonged to the House of Wettin, which had held the markgrafsdom from 1090, and from this time the name S. is applied only to the Wettin principality and to Lauenburg, which are within Lower S., and the inhabitants of which are not Saxons. Friedrich extended his possessions and welded them into a prosperous state, but the practice of dividing land equally among sons interfered with any scheme of development. Ernst (q. v.) and Albrecht, grandsons of Friedrich, after reigning together for twenty years, divided the dominion; the former, as the elder, receiving the electoral dignity with Thüringen, the latter receiving Meissen. The two lines thus founded, the Ernestine and Albertine, still survive, the latter, however, in the kingdom of S., the former in the duchies of Sachsen-Weimar-Eisenach (q. v.), Sachsen-Meiningen (q. v.), Sachsen-Altenburg (q. v.), and Sachsen-Koburg-Gotha (q. v.). Friedrich the Wise (1486-1525), son of Ernst, was the protector of Luther, and his brother, Johann the Constant (1525-32), was head of the Schmalkaldic League (q. v.). Johann Friedrich, son of the latter, lost after the defeat of Mülberg (q. v.), in 1547, the electorship and most part of his lands to his cousin Moritz (q. v.) of the Albertine line. The younger line, after the reigns of the wise economist August I. (q. v.), and the two weak princes Christian I. and Christian II., was headed by Johann Georg I. (1611-56), the able ally of Gustavus in the Thirty Years' War, who at the Peace of Westphalia (1648) received Upper and Lower Lausitz. The power of S., never greater than under Johann, began to decline as that of Brandenburg continued to rise. In 1697, August II. the Strong, being chosen king of Poland after the death of Sobieski, involved S. in the war with Karl XII. of Sweden. His successor, August III., also king of Poland, put forth a claim to the dominions of Maria Theresa, but subsequently joined the empress, and in the Seven Years' War lost to S. 90,000 men and 70,000,000 thalers. Under Friedrich August (1768-1827) S. gradually recovered strength, and on the outbreak of the war with France joined the Prussian confederation of princes. The elector had an army of 22,000 at Jena, but was compelled by Napoleon to join the Confederation of the Rhine in 1806, and received the title of king. By the Treaty of Tilsit the King of S. obtained the grand duchy of Warsaw (see POLAND) and portions of Prussia and Austria, but after an ineffectual attempt to break off his French alliance, was taken prisoner at the battle of Leipzig in 1815, and was forced to surrender Upper and Lower Lausitz, as well as his freshly-acquired possessions. In the period of peace which followed, Anton (1827-36) granted the constitution of 1831. In 1854 King Johann ascended the throne, and with his minister Beust (q. v.) stubbornly opposed the Prussian leadership, inclining towards that of Austria. An army was sent to aid the Austrians in 1866, and after the crushing defeat of Sadowa, S. only escaped political annihilation by entering the N. German Confederation, dismissing Beust, and paying an indemnity of 10,000,000 thalers. The Saxon troops remained true to the Fatherland during the Franco-German War, and fought with distinction at Metz, Sedan, and Paris (1870-71). They were led by the crown-prince Albrecht, who succeeded to the crown on the death of his father Johann, 29th October 1873. See Weisse's *Geschichte der Kursachs Staaten* (7 vols. Leip. 1802-12); Gretsche's *Geschichte des Sachs. Staats und Volks* (3 vols. Leip. 1841-54); Weber's *Archiv für Sachs. Geschichte* (Leip. 1862, et seq.), and Böttiger-Flathe's *Geschichte S.'s* (3 vols. Hamb. 1871).

Sax'ony, Prussian. See SACHSEN.

Say, Jean Baptiste, born at Lyon, January 5, 1767, was educated at Lyon and at Croydon, near London, and was early led to the study of political economy by reading *The Wealth of Nations*. He became connected with Mirabeau's paper, the *Courrier de Provence*, and afterwards acted as secretary to Clavière, the Girondist. In 1794 Andrieux and others made him editor of a periodical entitled *La Décade Philosophique*, of which, thanks to his energetic management, forty-two volumes were completed. In 1799 he was appointed a member of the tribunate, and in 1803 appeared his *Traité d'Economie Politique*. Bonaparte soon after this compelled him to withdraw from public life, and he established a cotton-mill at Auchy, retiring with a moderate fortune in 1812. A second edition of his *Traité*, the publication of which Napoleon prohibited, was eventually augmented by an *Épître des Principes Fondamentaux de l'Economie Politique*. After an excursion through Britain, he wrote *De l'Angleterre et des Anglais* (1812), *Catholicisme d'Economie Politique* (1817), and *Lettres à Malthus* (1820). In 1819 he was appointed to the new chair of *Economie Industrielle* in the *Conservatoire des Arts et Métiers*, and in 1830 he was elected Professor of Political Economy in the College of France. His lectures appeared as a *Cours Complet d'Economie Politique Pratique* (6 vols. 1828-30). S. died at Paris, November 16, 1832. A volume of *Mélanges et Correspondances* was published in 1833, and his works form vols. 9-12 of Guillaumin's *Collection des Economistes*.—**Horace Emile S.**, son of the preceding, was born at Noisy, near Paris, March 11, 1794. He was a merchant, and, after holding many high public offices, was appointed a minister in the *Conseil d'Etat*. His chief work is *Études sur l'Administration de la Ville de Paris* (1845). He died 26th July 1860.—**Jean Baptiste Leon S.**, son of Horace Emile, was born in 1826, attained an influential position in the management of the *Chemins de Fer du Nord*, devoted his leisure to the study of political economy, and was for some time joint-editor of the *Journal des Débats*. In 1871 he took his place as a member of the 'left centre' in the National Assembly, and in the same year was made Prefect of the Seine. He became Minister of Finance under Thiers in 1872, and again 1875-77. Since 1876 he has been a senator.

Say, Thomas, an American naturalist, was born at Philadelphia, July 27, 1787. He began life as a druggist, but subsequently devoted himself to natural history, and was zoologist to several American exploring expeditions between the years 1818 and 1823. In 1825 he joined Maclure and Owen in their socialistic experiment at New Harmony, Indiana, where he died, October 10, 1834. His *Complete Writings on the Conchology of the United States* were published at New York in 1858, and his *Complete Writings on the Entomology of the United States*, with a Memoir by George Ord, in 1859. See *Biographical Sketch of T. S.*, by Dr. Coates (Phil. 1835).

Sbirri (Ital.), a name formerly given in Italy, particularly in the States of the Church, to a body of secret police under military organisation, who were charged with the arrest of criminals and suspected persons. They were suppressed in 1809.

Scab, a disease of sheep caused by the presence in the skin of a minute *acarus* or mite. This parasite causes pustular irritation, and the 'scabs' which fall off may produce baldness. The parasite is liable to be transferred from diseased to healthy sheep, hence the necessity for isolating the affected subjects. The most approved remedies are mercurial ointment, turpentine and oil, tobacco-lotions, &c.

Scabb'ard, a sheath for a sword, dagger, knife, or bayonet. It is commonly made of black or brown leather, with a *chape-riug* and *locket* of metal. The sword S. of the British cavalry is formed of polished steel. Old English and Norman sheaths were generally of wood covered with leather; and during the reigns of Henry VIII. and Elizabeth, dagger scabbards of steel or bronze, with elaborate decorations, were worn by the nobility.

Scabies. See ITCH.

Scabious, or **Scabiosa** (from *L. scabies*, 'scurf,' in allusion to the scaly pappus of the seeds), a genus of about 90 species of perennial herbs belonging to the natural order *Dipsacaceae*. They have entire or pinnatifid leaves, hemispheric or depressed

flower-heads of various colours, with outer florets often large and rayed; hairy receptacle, or with scaly floral bracts, calyx teeth of persistent bristles, four stamens, and style filiform. *S. Succisa*, or Devil's-bit S.—so called on account of the abruptly truncate rootstock—and *S. (Knaulia) arvensis*, are common plants of the N. temperate zone in the Old World, and are frequent in Britain.

Scad, or Horse Mackerel (*Trachurus*, or *Carangus trachurus*), a Teleostean fish allied to the Mackerel (q. v.), and belonging to the Scomberidae or Mackerel family. The S. is a common British fish, and attains a length of from 10 to 16 inches. Its colour is a dusky olive on the back, glossed with green on the side, and variegated with blue bands. The abdomen and sides of the head are silvery white. The lateral line has prominent scales, which give a square outline to the body behind. The flesh, which is somewhat coarse, is often eaten in a salted state by the poorer classes in the S.W. of Britain.

Scafell, or Scawfell, the highest mountain in England, is situated in Cumberland, near the border of Westmoreland, 10 miles N.E. of Ravenglass. It has two peaks, 3208 and 3092 feet high respectively, and is one of the most conspicuous objects in the Lake district, in the centre of which it stands.

Scagliola (Ital. from *scaglia*, 'chips of marble'), a coloured plaster or stucco composed of fine calcined gypsum and glue or isinglass, and used to form columns, pilasters, &c., for internal decoration, in imitation of marbles and other ornamental stones. A bed of lath and ordinary plaster is first prepared, and on it the gypsum mixture is spread and 'floated' with wooden implements; the desired colours (if not already diffused through the S.) are then applied to the wet surface. To imitate certain marbles, chips and dust of marble, spar, granite, &c., are also pressed into the wet plaster. The S. dries hard, and is susceptible of a high polish.

Sca'la No'va, an important harbour of Asia Minor, vilayet of Aidin, on an inlet of the Ægean, 40 miles S. of Smyrna. It lies near the ancient Ephesus (q. v.), and has a considerable export trade. Pop. 10,000.

Scalar, a mathematical term invented by Sir W. R. Hamilton, including all quantities essentially non-directional. All numbers and the ordinary symbols of algebra and analysis which are subject to the same laws as these are scalars. See QUATERNIONS and VECTOR.

Scala'ria, a well-known genus of *Gastropodous* Mollusca, including the Wentletraps, of which the most famous species is the Precious Wentletrap or Royal Staircase (*S. pretiosa*), a good specimen of which, in the days of conchological pursuits, fetched as much as £50. This species is found in tropical seas. The common S. or Wentletrap (*S. communis*) is plentiful on the British coasts. The shells in S. are tubular, spiral and turreted in shape. The foot is short, and in the true Wentletraps the whorls or turns of the shell are distinct. In some of the *Scala'ria* there is a gland secreting a purple colour like that obtained from the famous purple whelk of Tyre.

Scale-Armour. See ARMOUR.

Scale, Musical, the succession of notes from a note in a given key to its octave. Guido d'Arezzo, the inventor of modern notation, used only six notes in his scale; but an arrangement of seven notes, taking the names of the first seven letters of the alphabet, was afterwards adopted. The scales in modern use are either in the major or the minor mode (see MUSIC). The intervals of a minor scale produce a plaintive effect, and the change from the major to the minor scale is often an effective musical device. Within the compass of an octave an arrangement of 72 notes would be required to give an idea of all the keys now used in music.

Scales, the *exoskeletal*, or skin appendages of vertebrate animals, found typically in *Fishes*, absent in *Amphibians* as a rule, but also occurring in *Reptiles*, and in a modified degree in some *Mammalia* (e.g. Armadillos and Pangolins). S. vary in their nature. Of the two layers of which the *skin* is composed, the outer or *epidermis* is rarely ossified, but it is this layer which forms the 'tortoise-shell' of commerce, obtained from the *Chelonia imbricata*. The under layer or *dermis*, on the other hand, is often ossified, and forms the bony plates of the armadillos, which

are covered by a thin epidermal layer. The S. of fishes are imbedded in the dermis, and represent structures formed by the latter layer, while the S. of reptiles also exhibit epidermic characters. The commonest variety of fish-scale is that seen in the salmon, herring, &c., in the form of a little thin circular plate of horn named a *cycloid* scale. The S. of the Perches, &c., have a hinder serrated margin, and are named *ctenoid*. Those of sharks and rays consist of a little plate of bone, with or without a spine, and are named *placoid* S.; whilst in the sturgeon, bony pike, &c., the S. are *ganoid*, formed of a hard enamel substance, and articulated by definite processes.

Scales of Notation. In arithmetic, numbers are represented by numerals placed side by side, and each numeral has a local as well as an intrinsic value. Thus in the number 666, each numeral, though intrinsically the same, differs in value according to its position—the first 6 representing six hundreds, the second, six tens, and the third, six units. This number, six hundred and sixty-six, belongs to the decimal scale, or the scale whose radix is 10. If we choose as our radix the numeral 7, the expression 666 represents a very different number. The last 6 represents (as before) six units; the second, six *sevens*; and the first, six *seven-times-sevens* or six forty-nines. The number 666 in septenary scale becomes, when transformed into decimal scale, $6 + 6 \times 7 + 6 \times 7 \times 7 = 6 + 42 + 294 = 342$. Similarly 123 in the quaternary scale becomes, when transformed, $27 (= 3 + 2 \times 4 + 1 \times 4^2)$ in the decimal scale. If it had been desired to express this number in the *senary* scale (with 6 as radix), then, instead of adding together 3, 8, and 16, we should require to add 3, 12, and 24, since 12 and 24 are the senary scale symbols for the ordinary 8 and 16. In making the addition, we must divide by six and carry accordingly. The first column gives, then, 13, and therefore the sum is 43. The most convenient method for transforming any given number in the decimal scale to its analogue in another scale is by a series of divisions, of which two examples will indicate the nature. Transform the number 27 into the binary and quinary scales

$$\begin{array}{r} 2 \overline{) 27} \\ 2 \overline{) 13} - 1 \\ 2 \overline{) 6} - 1 \\ 2 \overline{) 3} - 0 \\ 1 - 1 \end{array} \qquad \begin{array}{r} 5 \overline{) 27} \\ 5 \overline{) 5} - 2 \\ \phantom{5 \overline{) 5}} 1 - 0 \end{array}$$

Taking the remainders in succession, the numbers stand 11011 and 102.

Scaliger, Julius Oe'sar, born at Padua, or Verona, April 23, 1484, was descended, according to his own account, from the princely Veronese family of Della Scala; but Tiraboschi makes him the son of a miniaturist at Venice. He studied medicine, and up to the age of forty-two practised as a physician in Venice and Padua. In 1525 he entered the service of the Bishop of Agen, and in 1529 he married Adiette de Roques-Lobesac, a young lady of rich and noble family. Although possessed of a prodigious memory and indomitable perseverance, he had little taste and less modesty; but was nevertheless an honest and truth-loving man. 'Never tell a lie' was his constant language to his children, and in his illustrious son the exhortation bore good fruit. S. wrote quantities of Latin poetry, commented on and translated many classics, and wrote controversial treatises, including a fierce attack on Erasmus—*J. C. Scaligeri adv. Desid. Erasmus Orationes Duæ* (1531–36, reprinted Toulouse, 1621). His chief works are the first considerable modern Latin grammar, *De Causis Linguae Latinae Libri XIII.* (Lyon, 1540), and *Poetices Libri VII.* (Lyon, 1561). He died at Agen, October 21, 1558.—**Joseph Justus S.**, tenth son of the preceding, born at Agen, August 4, 1540, studied Latin mainly under his father. Greek he learned under Turnebus at Paris; and such was his passion for the classics that he committed Homer to memory in twenty-one days, and read all the Greek poets within four months. In 1563 Louis Chastaigner de la Rochepozay, afterwards ambassador at Rome, enabled him to make a tour through Europe. The friendship of this fine nobleman, in whose house he lived off and on for thirty years, was maintained unbroken through all the vicissitudes of a stormy age. In 1578 he taught philosophy at Geneva for a short time; and in 1593 he succeeded Lipsius in the chair of literature at Leyden University, which he held till his death, 21st January, 1609. Towards the close of his career, S. was denounced and calumniated by the Jesuits in pamphlets of

unparalleled foulness. In the *Scaliger Hypobolimus* (1607) of Sciooppius, the slanderous gossip of all the Jesuit colleges in Italy and Germany was poured out on the veteran scholar, who was hated almost to the point of insanity for his immovable attachment to the Protestant faith. S. far excelled his father in learning, in intellectual vigour, and philosophical penetration. He was, in truth, the brightest light of the 16th c. in critical and rational scholarship. Gibbon and Niebuhr both recognised his great qualities. It was S. who proposed the readjustment of the Julian period (see CALENDAR). He was the first to maintain with any show of learning that the Greek letters are derived from the Phœnician. Besides editing numerous classical authors, he wrote *De Emendatione Temporum* (Par. 1583), the first sketch of a general history of mankind, and *Thesaurus Temporum* (Leyd. 1606), a work in which profound erudition boldly applied almost succeeds in restoring the first book of the *Chronicon* of Eusebius. In the 17th and 18th centuries his vast reputation declined. He was regarded as the type of a 'pedant,' though he was precisely the reverse, and it was not till the publication of Bernays' work that the injustice of the previous centuries was remedied, and S. restored to his rightful throne. After his death appeared *Pœmata Omnia* (Leyd. 1615), and a collection of *Epistole* (1627). Two volumes of *Scaligerana* were published, one containing S.'s conversations during 1674-93, collected by Vertunien (Grön. 1669), and the other those between 1603-6, collected by the brothers Vassau (Hague, 1666). Both were conjoined in an Amsterdam edition of 1695 (new ed. 1740). See Bernays' *Joseph Justus Scaliger* (Berl. 1855).

Scalp, the name given to the outer covering of the skull, composed of skin and of the expanded tendon of the occipito-frontal muscle, and of intermediate cellular tissue and blood-vessels. There are certain peculiarities in the surgical anatomy of the scalp, which render even slight injuries of importance. (1.) The skin is intimately connected to the tendon of the occipito-frontalis muscle, instead of being separated from it by cellular tissue. (2.) The large vessels lie immediately beneath the skin, instead of under the fascia, as in other parts. (3.) The tendon of the occipito-frontalis is loosely united to the pericranium by very extensible cellular tissue, and is perforated by small arteries, which run from the larger vessels through the cellular tissue, to nourish the pericranium. Consequently (1) wounds of the skin almost always involve the tendon also; (2) bleeding from the large arteries is generally easily commanded, in consequence of their superficial position; (3) in diffuse inflammation of the S. the thickness of the part is often enormously increased by extravasated lymph, and such extravasations will very probably strangle the vessels nourishing the pericranium.—(Holmes' *Principles and Practice of Surgery*, p. 127.) The chief injuries of the S. are contusions and S.-wounds. The usual complications of S.-wounds are Erysipelas (q. v.), and suppuration within the cranium, both being attended with great danger to life. In simple contusion a slightly stimulating lotion may be applied, such as Lotio Ammon. Hydrochlor. gr. X to the ounce of water. Extravasation of blood, as the result of injury, may occur (1) external to the cranium; (2) between the bone and the dura mater; (3) in the arachnoid cavity; and (4) in the substance of the brain. Tumours of the S. are common, the most frequent being cutaneous cysts (often congenital), popularly known as *Wens* (q. v.), and vascular tumours.

Scaly Ant'-eater. See PANGOLIN.

Scamander, a river of Troy, which rose in Mount Ida, and entered the sea E. of Cape Sigeum (Kum Kale). It is frequently mentioned in Homer, who says the gods called it Xanthus ('the yellow'). Herodotus relates that when the army of Xerxes crossed it on their way to Greece, its waters were not sufficient for their wants. Though its bed may have altered in several places, it is doubtless the same river as the modern *Menderes*.

Scamillus (Lat. 'little bench,' dim. of *scammum*, 'bench,' from *scandere*, 'to ascend'), a plain block or sub-plinth placed below a column or statue to elevate it.

Scammony is a resinous substance obtained from the roots of various species of *Convolvulus*, principally *C. scammonia*. The plants grow wild on the dry slopes of hill-sides throughout

Asia Minor. In the month of July annually the peasants who collect S. proceed to the hills, where they practise two methods of securing the resin. (1) They clear away earth, &c., from around the root and cut off the stem at its junction, when immediately a milky juice flows from the root, which is caught in shells, on which it soon dries and hardens, thus forming S. Formerly the material was imported on these shells, and so prepared it is the finest virgin or 'first drop' S. (2) The roots are dug up, sliced, pounded, and the juice squeezed out, thus yielding an impure article, which is further adulterated by those engaged in its preparation. Pure S. possesses a greenish-grey colour and a peculiar cheesy smell. The finest quality is imported from Aleppo, Smyrna S. being esteemed the lowest. It is used only medicinally, being a very powerful drastic purgative, and an anthelmintic, and is of great use in a torpid and inactive condition of the bowels. The dose for an adult is from 4 to 15 grains, according to the purpose for which it is taken.

Scandalum Magnatum consisted or consists in speaking derogatorily of any peer, judge, or high officer of the realm. The procedure formerly adopted in the case of such an offence has fallen into disuse, and punishment by action, information, or indictment is the course now followed.

Scanderbeg (properly George Castriota), the great patriot of Albania, was the son of an Epirote chief, John Castriota, and was born in 1414. Along with three brothers he was delivered at the age of nine to the Sultan, Murad II., as hostages for the submission of Albania. His brothers are said to have been poisoned, but his beauty and intelligence attracted the attention of the Sultan, who made him embrace Islamism, and caused him to be instructed in the Turkish, Arabic, Slavic, and Italian languages, as well as in all manly exercises. In 1433 he distinguished himself in the wars in Asia, where he gained the name of *Iskander Beg* (Prince Alexander), and in 1443 he was sent into Europe with an army of 20,000 men to attack Servia. Meanwhile, on the death of his father (1442), Albania had been occupied by the Turks, and he now determined to free it from their rule. He purposely lost the first battle against the Hungarians, and with 300 companions fled from the field to Croia, the capital of Epirus, having first forced Murad's secretary (whom he immediately afterwards murdered) to draw out an order constituting him governor of the fortress. Admitted to Croia by means of this order, he at once massacred the Turkish garrison. The country rose to his standard, and in a month he expelled all the Turks except the garrison of Sfetgrad. Now began a long course of defensive war. In 1444, with 15,000 men he cut to pieces an army of 40,000 Turks. Murad made him an offer of reconciliation in 1445, but he rejected it, and between that date and 1448 defeated three great Ottoman armies one after the other. In 1449 Murad himself took the field, but was forced by ill-health to retire from before the walls of Croia, and died at Adrianople. S. married (1451) the daughter of a powerful Albanian chief. In 1453, after the fall of Constantinople, Mahomet II. made him an offer of peace, but it was refused, and a Turkish army was sent against him under the command of a renegade Epirote chief. He defeated this force, as well as another in 1456, which was conducted by his own nephew, Hamza. In 1461, after having won several more victories over the Turks, he at last concluded peace with Mohammed II., and crossed over to Italy to assist Ferdinand, King of Naples, against John of Anjou. In this he was entirely successful (1462), and returned loaded with titles and papal blessings. In 1463 he was prevailed on again to declare war against the Moslems. He gained no less than seven victories, and by an eighth and decisive struggle before Croia succeeded in driving the Turks out of the country. Shortly afterwards he was seized with a fever, and died at Alessio, 17th of January 1467. S. was a man of heroic courage and indomitable spirit, extremely temperate and even ascetic in his mode of life, and said to have been deeply religious. After his death the resistance of Albania declined, and it was entirely quelled in the course of about eleven years. See Barlesio, *De Vita et Moribus Georgii Castrioti* (Strassb. 1537); Paganel, *Histoire de S.* (Par. 1855); and a Life by Dr. Moore (New York, 1850).

Scandina'via, the common name of the great peninsula in the N. of Europe washed by the Atlantic Ocean and the North Sea on the W., and by the Baltic and the Gulf of Finland on the E. It comprises the kingdoms of Norway (q. v.) and Sweden

(q. v.), and the groups of islands lying in the seas between these and Germany. The 'Cimbric Chersonese' or the Danish mainland is sometimes included among the 'Scandinavian Kingdoms,' but belongs naturally and historically to Germany; took its name, moreover, from the Cimbri, and was inhabited at first by non-Scandinavian nations. Pliny (IV. 13) calls S. 'the most famous island of the *Sinus Codanus*, of unknown size.' The termination *avia* implies 'an island,' being identical with the Goth. *avi* (gen. *avjōs*), the Old Norse *ey* (gen. *eyjar*), the O. H. Ger. *ouwa* (for *ouwia*) and *augia*, and Old Eng. *ig*. The name 'S.,' which was originally applied only to a portion of the central coast of the peninsula, is a Latinised form of the same word as the Old Eng. 'Scedenigge,' the 'Sconeg' of Ælfred and 'Scania' of Saxo, the Dan. and Swed. 'Skaane' (q. v.), and Ger. 'Schönen.'

The *Scandinavian Languages*, forming one of the three groups of the Teutonic (q. v.) family, embrace the languages of the North Teutonic peoples, the Old Norse, of which the oldest idiom, transplanted to Iceland (q. v.) in the 9th c., still survives there, the Danish (q. v.), the Swedish (q. v.), and the popular dialect of Norway (q. v.). They are marked by two striking peculiarities—(1) the definite article (in Old Norse *inn=ille*, *in=illa*, *itt=illud*) follows its substantive, and coalesces with it; as in Old Norse *hani-nn*, 'the cock,' *gjöf-in*, 'the gift,' *fat-it*, 'the foot'; Dan. and Swed. *mann-en*, 'the man,' *bord-et*, 'the table'; (2) the reflex pronoun (in Old Norse *sik*, Swed. and Dan. *sig*, Lat. *se=se*) coalesces with verbs, forming a reflexive suffix. Thus *at falla*, 'to fall down,' with *sik* added, produces the 'middle' verb *at fallask*. *Sik* worn down to *st* and added to the verb makes it passive, as at *kallast*, 'to be called.' Thus have arisen the Eng. words *busk* (Icel. *bua*, 'to prepare'), and *bask* (= *bak-sk*), from Icel. *baka*, 'to warm,' Eng. *bake*. The Old Norse was written in Runes (q. v.) till the adoption of the Roman Alphabet in 1057. Its rich poetry is mainly epic, on subjects drawn from the Northern Mythology (q. v.) and heroic age, and running in two streams—popular legend of gods and heroes, whose grandest reach is the Elder Edda (q. v.), and artistic scald-song, best from the 10th to the 13th c. End-rime was from 1150 sometimes used instead of the characteristic alliteration (*Drottinn*). Old Norse prose, cultivated in Iceland from the 12th c., contains many Scandinavian histories, of which the most famous is the *Heimskringla* of Snorri Sturluson (q. v.), and Sagas (q. v.), as the *Volsung* tale, the tale of King *Lodbrok*, and of *Frithjof*, as well as didactic works like the *Younger Edda* (q. v.). See Löffler, *Den Skandinaviske Hælv* (Copenh. 1860), and Grimm, *Geschichte der Teutonischen Sprachen* (new ed. Leip. 1868).

Scandinavian Mythology. See NORTHERN MYTHOLOGY.

Scanso'res, an order of birds represented by the parrots, woodpeckers, cuckoos, toucans, &c., popularly known as the order of 'Climbing Birds.' The toes are arranged two in front and two behind, and are adapted for climbing. The bill varies in form, being either hooked and arched as in parrots, or straight and long as in woodpeckers. The wings, as a rule, are short, and the flight feeble and imperfect. The S. are *monogamous*, one male mating with one female.

Scant'ling (Fr. *chantillon*, 'a sample or pattern'), in carpentry, the dimensions, in breadth and thickness, of any piece of timber; also a term applied to a piece of timber under 5 inches square, used for studs, braces, &c.; in masonry, the dimensions of a dressed stone.

Scaph'oid Bone, one of the eight bones which form the *carpus* or 'wrist' in man. The S. is a boat-shaped bone (hence its name) in the first of the two rows of the carpal bones, and forms along with the *lunare* a convex surface for the lower cup-shaped end of the *Radius* (q. v.).

Scapple, in masonry, is to dress or tool a stone level without smoothing it.

Scap'ula, the *shoulder-blade* of vertebrates. It is represented in all classes of *Vertebrata*. The bone seems to consist in man of at least two elements, which are distinct in birds and reptiles. Thus the *coracoid process* of man's S. is represented as a distinct bone in birds and reptiles, and in lower vertebrates; but even in man's own class, the 'coracoid process' may exist as a distinct bone, as in the *Ornithorhynchus* (q. v.) and *Echidna* (q. v.). In man, the S. is a triangular flattened bone, lying on the back of the shoulder, and bearing the

glenoid cavity, which receives the head of the *humerus*, or bone of the upper arm. The concave surface of the S. is applied to the ribs, and across the *convex* or dorsal (outer) surface of the bone a ridge named the *spine* of the S. runs in an oblique manner. The space above this ridge is the *supra-spinous fossa*, that below being the *infra-spinous fossa*. The spine of the S. terminates at the outer side of the bone in the *acromion process*, whilst the *coracoid process* occurs in part of a deep notch in the upper and shortest border of the S. The *vertebral border* of the bone, or that next the spine, is the largest of its borders. The *neck* of the S. is a short bony process supporting a shallow cup, the *glenoid cavity*, in which the head of the *humerus* or upper arm bone rotates. The development of the S. takes place from seven centres of ossification. The bone itself articulates with the *Humerus* (q. v.) and *Clavicle* (q. v.), and very many important muscles are attached to it. In birds the S. is a long narrow bone, the *coracoid element* forming a separate bone, and constituting the chief support of the wing. In the dog, shrew, and mole, the S. is extremely narrow. In fishes the S. is usually small, the *clavicle* being developed to a much greater extent. The *acromion process* is wanting in the Giraffe (q. v.) and Hyrax (q. v.), whilst in birds and in the two-toed sloth the *acromion* and *coracoid* are articulated. The *coracoid process* is rudimentary in Ungulata (q. v.). It is divided and well developed in some bats. Several *glenoid surfaces* occur in the rays amongst fishes; and in one fish (the Opah fish or *Lumpfish*) the *coracoid* attains an immense development.

Scap'ular, or **Scap'ulary** (from Lat. *scapula*, 'the shoulder'), is an article of dress worn by religious orders and devout persons in the Roman Catholic Church. It was substituted by St. Benedict (q. v.) for the heavy cowl formerly worn by monks. In form the S. is a vestment of woollen stuff, which passes over the head and rests on the shoulders, with a band hanging down both before and behind. A small S. is carried about by some of the faithful for purposes of devotion.

Scarabe'us, or **Beetle-Stone**, is a stone signet or amulet carved into the form of a beetle, belonging to the group *Scarabæide*, and bearing an intaglio device on a flat base. Scarabei were among the earliest products of the art of engraving on stones, being executed in great numbers by the Egyptians, Phœnicians, and Etruscans. The insect most frequently figured by the former people was the 'sacred beetle,' *Atrachus* (syn. *Scarabeus*) *sacer*, which was worshipped as an emblem of Pthah, the creative power, on account of its peculiar habit of forming little balls or pellets of dung as depositories for its eggs. It was also regarded as a symbol of Pthah, the sun. The S. of Egyptian origin has been found of different sizes from less than half an inch to upwards of a yard long. The smaller kinds are carved in steatite, limestone, or terra cotta, the last two materials being usually coated with a pale blue vitreous glaze; colossal sizes are cut in basalt, granite, &c. The S. of the Etruscans differed from the Egyptian in being always formed of *pierrres fines*, as sard, onyx, &c., and in seldom exceeding an inch in length. Heroes, chariots of war, and such like warlike subjects are invariably cut in intaglio on Early Etruscan scarabei, hence it is supposed they constituted rewards for military prowess among that people. The Greeks adopted the *scarabæoid* form for signet-rings and necklace pendants. Many of the talismans of the Alexandrian Gnostics also took the form of scarabei, and like ornaments, of reputed prophylactic virtue, continued to be worn so late as the 16th c.

Scarabi'dæ, or **Scarabæidæ**, otherwise named *Lamellicorn* Beetles of Latreille, are a large and important family of *Coleoptera* (q. v.) numbering about 700 genera and 6000 species. Many of these are veritable giants among beetles. The S. are recognised by their clubbed *antennæ* or feelers, the last joints of which are expanded to form a series of flattened leaves. The legs are strong and usually terminated by thick claws. The *larvæ* are large fleshy grubs, and have long four-jointed *antennæ*. The classification of this group is still undetermined. One proposed system divides the S. according to their food. Some of the more notable genera are *Scarabeus* itself, *Goliathus*, *Dynastes*, *Cetonia*, *Macroductylus*, *Melolontha*, and *Geotrupes*.

Scar'amouch (Fr. *escarmouche*, from Ital. *Scaramuccia*, 'a skirmish'), a character of the old Italian comedy, substituted about 1680 for the Spanish *capitan*, some of whose characteristics

he retained. He is a *miles gloriosus*, a braggart and swaggerer, who invariably gets beaten in the end, generally by his comrade the *Arlecchino*. He is always dressed in black, and wears a rapier. The great S. of the Italian stage was Tiberio Fiorelli; and Goldoni, too, at one time played this part.

Scarborough, a seaport, watering-place, and municipal and parliamentary borough in the North Riding of Yorkshire, 42 miles N.E. of York by rail. It is situated on a semicircular bay, open to the S.W., but protected to the N. by a high promontory from which it takes its name ('the fort on the rock'), on whose summit is an old castle erected in the reign of Stephen. In it Piers Gaveston, the favourite of Edward II., was besieged by the Earl of Pembroke in 1212, and in the Civil Wars it twice underwent a siege. It is now used as a barrack, and has been surrounded by batteries. The old portion of the town is close under the castle, and the newer parts rise in handsome semicircular terraces along the sloping shore. S. is cut off from the Spa and the southern suburb by a chasm 75 feet deep and 400 feet wide, which is spanned by the Cliff Bridge, erected in 1827, and the Valley Bridge, erected in 1865. The springs contain carbonate and sulphate of lime, magnesia, and oxide of iron, and are of great medicinal efficacy, while the sands afford very pleasant sea-bathing. S. harbour has three piers, two of which are 1200 feet long. In 1877, 353 vessels of an aggregate tonnage of 18,619 tons entered and cleared the port. In 1876 the Spa Saloon was burnt down, but has since been rebuilt at a cost of £60,000, and in 1877 the new aquarium was opened, which covers an area of 3 acres, contains 46 tanks (one holding 75,000 gallons of water), and cost over £120,000. S. has nineteen places of worship, a large mechanics' hall, a museum, several handsome hotels (the Grand Hotel on St. Nicholas Cliff, with 300 bedrooms, 30 sitting-rooms, &c.), assembly rooms, and two theatres. The Town Council accepted plans (June 1878) for the enlargement and improvement of the harbour at a cost of £13,000. A fine asphalted promenade and carriage-drive from the aquarium to the West Pier were opened in 1877. Pop. (1871) 24,259, has now (1878) reached about 30,000, and is greatly increased during the season from June to October. S., since the time of Edward I., has been represented in Parliament by two members.

Scar'fing, in carpentry, a mode of joining two pieces of timber end-wise. It is done in many different ways, by beveling off the ends and making projections in one fit into hollows in the other. Occasionally a *joggle* or wedge is introduced, and the union is secured by bolts or straps.

Scarfs.

Scarlati'na, or **Scarlet Fever**, is one of the group of diseases called Exanthemata (q. v.). It was long confounded with measles, being considered merely a variety of that disease, and it is only since the beginning of the last century that it has been recognised as a specific and independent disease. The first allusion to it as a peculiar affection was made by Ingrassias, in a work published in 1556. S. may be ushered in either *with* or *without* the premonitory symptoms of languor, weariness, rigors, and pains in the back and limbs. The subsequent fever is manifested by an accelerated pulse, hot dry skin, flushed face, furred tongue, thirst, and great muscular prostration; and the severity of the fever may be of every grade up to the highest point of violence and danger. Usually on the second day of the illness, but often earlier or later, and sometimes at the very commencement, a scarlet efflorescence, which disappears on pressure, appears first upon the neck, face, and breast, whence it gradually spreads over the trunk and extremities; but it sometimes appears first on the arms, trunk, and inner side of the thighs, and thence proceeds to the face and the inferior extremities. At first the eruption appears as minute red points, which rapidly coalesce in broad patches, and soon form a continuous scarlet blush over a considerable portion of the surface. The tonsils, the fauces, and the pharynx are also more or less affected, and there is usually sore-throat. The appearance of the tongue is very characteristic, being first covered with a white fur, and as this clears away it becomes red, and the lengthened filiform papillæ project, giving it a peculiar strawberry appearance.

From the fifth to the sixth day the kidneys are nearly always affected, and the throat is then often severely implicated. S. usually attains its maximum intensity from the fifth to the ninth day, when, in favourable cases, the symptoms begin gradually to subside, the amendment being sometimes accompanied by a profuse perspiration, or diarrhoea. Desquamation, or peeling of the skin, generally begins with the decline of the eruption, and the cuticle or scarf skin separates in small scales; but where it is thick, as on the palms of the hands or soles of the feet, it may come away in large flakes.

Several forms of S. are described, but the varieties simply denote degrees of the affection. In *S. simplex* there are only the fever and the rash, the throat affections being absent. In *S. anginosa*, the affection of the fauces is the prominent symptom, stiffness of the jaws, soreness of throat, and pain in swallowing being often experienced at the commencement of the attack. In *S. maligna* the system is at once overwhelmed by the force of the disease, and there is actual sloughing of the parts affected. The disease, however, is essentially the same in all its varieties, and is produced by the same cause; viz., a specific poison. The sequelæ of S. are dropsy, in the form of anasarca; abscesses in the vicinity of the glands of the neck; various affections of the ear, often causing deafness; and muco-purulent discharges from the nose. Such results are more common in those cases where the primary fever has been slight, the case being neglected owing to its apparent mildness, and where the patient has been exposed to colds and draughts during the process of desquamation.

S. is a disease almost peculiar to childhood, occurring only once in a lifetime; and during recent years several very fatal epidemics have occurred. In 1870, S. caused 32,543 deaths in England alone; and in 1855-71, 321,893; and of these, 206,930 occurred among children under five years of age. The average of the seventeen years' mortality in England very clearly shows that five years of age is by far the most critical period as regards the number of fatal results.

S. is undoubtedly a communicable disease, and the poison or contagion, whatever its nature may be, multiplies with great rapidity and affects the whole body, more especially the epithelial cells. The poison is principally, but not exclusively, thrown off in the epithelial cells which cover the skin of the body, the mouth, the intestinal canal, and even the tubes of the kidneys. The specific contagion is contained in everything which proceeds from the patient, but more especially in the epithelial scales given off during desquamation, which may be conveyed by the currents of air to every part of the room, and settle on clothing, bedding, furniture, walls, &c. The contagious matter preserves its vitality for an unknown period of time, for months, and, possibly, for years, so that the disease may unexpectedly make its appearance when a susceptible person is exposed to slight traces of the infection which may linger on clothing or within an infected chamber. S. is not so infectious during the first day or two of sore-throat as it afterwards becomes, so that an early separation gives good hope of security to the other members of a family, especially if the exposure has not been very close, such as from sleeping in the same bed. The possibility of infection, however, begins as soon as the disease, so that all available means should be used for guarding against infection while the patient is only sickening with the disease, and even before the characteristic rash has appeared.

Treatment.—In *S. simplex* the patient should be kept in bed, in a warm room, until the desquamation is over, and after that flannel should be worn. For a drink, chlorate of potash, 60 grains in a pint of water, may be given freely. The warm bath may be given daily. In *S. anginosa*, tepid sponging, cold effusions, or wet sheet-packing, may be employed. In some cases shaving of the head and the application of vinegar cloths will be of advantage. When there is ulceration of the throat, the part may be touched with nitrate of silver, or with a mixture of iron and glycerine. In cases of anasarca, the loins ought to be cupped, and this should be followed by the application of hot linseed-meal poultices. The bowels should be kept free, and, in some cases, hydragogue cathartics are necessary to relieve the strain on the kidneys. Tonics containing iron, or ammonia and bark, should be given from the commencement; the diet should be generous, with plenty of milk, and a uniform temperature of 60° F. should be maintained. The successful issue of a case of S. depends more upon careful and judicious nursing than upon so-called specifics.

Scarlatt'i, Alessan'dro, founder of the famous Neapolitan school of music, was born at Trapani, in Sicily, in 1649. He was instructed by Carissimi at Rome, after which he studied at Bologna, Florence, and Vienna. The remainder of his life was spent in the most active cultivation of his art in Naples. He composed more quickly than his copyist could write, and left over a hundred operas, twice that number of masses, besides numerous cantatas, oratorios, and much chambermusic. Among the best of his dramatic works are *Teodora* (1694), *Laodicea e Berenice* (1701), and *Il Medo* (1708). A master of harmony, his modulations were ingenious and pleasing, and his style was rich, learned, and inventive. In addition to many other improvements in the art of music, he was the inventor of the obligato recitative and the ritornel. He treated the Overture (q. v.) in an entirely fresh and original manner. Durante, Hasse, and Logroscino were among his pupils. He died in 1728.—**Domenico S.**, son of the preceding, was born in Naples in 1681. In his youth he was attached to Handel, from whom he derived much instruction. He was a master of the harpsichord, and his forty-two *Fieces pour le Clavecin* were for many years considered the highest test of proficiency in a pianist. His compositions are marked by variety, grace, and charm of melody. He died in 1757.—**Giuseppe S.**, grandson of Alessandro S. (1708-76), was a successful composer of operas and works for the harpsichord. See Fétis, *Biogr. Univer. des Musiciens* (new ed. 1878).

Scarlet is a brilliant red colour slightly tinged with yellow. As a dye colour it is chiefly prepared from cochineal with a double chloride of tin and ammonium, called S. spirits.

Scarlet Runn'er. See KIDNEY BEAN.

Scar'pa, Anto'nio, an Italian anatomist and surgeon, was born at Motta, in Treviso, June 13, 1747. He studied at Padua and Bologna, and in 1772 became professor of anatomy at Modena, and surgeon to the hospital. Displeased at the reforms wrought by Duke Ercole III., he resigned his post in 1780, and sought solace in travel. In 1784 he accepted the chair of anatomy at Pavia. Here, as at Modena, he enriched his science by many valuable discoveries relating to nervous action, diseases of the eyes, aneurisms, &c. Failing eyesight induced him to resign in 1804; but at the request of Napoleon he resumed his duties, and continued to perform them till 1812. Subsequently, when Pavia was restored to Austria, he was made director of the medical faculty, a post which he soon resigned. He died at Pavia, October 31, 1832. The most important of S.'s numerous works are *De Structura Fenestræ rotundæ duris* (1772), *De Gangliis et Plexibus Nervorum* (1779), *Anatomicæ Disquisitiones de Auditui et Olfactu* (1789), *Tabulæ Neurologiæ* (1794), *De Anatomia et Pathologia Ossium* (1827), *Sulle principali Malattie degli Occhi* (1801; 5th ed. 1816), *Sull' Aneurisma* (1804; Eng. trans. 1808, 1819), *Sull' Ernie* (1809-10; 2d ed. 1820). His complete works were collected by Vanoni, and published at Florence (5 vols. 1836-39).

Scarpan'to, or Karpath'o, an island in the Mediterranean, 40 miles N.E. of Crete, is 32 miles long, and from 4 to 8 miles broad. It is mountainous, the highest summit being 4000 feet high. It belongs to Turkey. Pop. 5000, who are mostly engaged in carpentry.

Scarr'on, Paul, born at Grenoble in 1610, was the son of a councillor of parliament. His youth was given up to excesses of all kinds, and at the age of twenty-seven he became a paralytic, through exposure to frost during an insane and indecent frolic. His body assumed the shape of a Z, and he could move only his hands, yet the laugh never left his lips, and the one thing impossible for him was to be serious. Writing by turns plays and amusing begging letters for pensions and benefices, he managed to live in comfort, and welcomed the gay world nightly at his supper table. In 1651 he married Françoise d'Aubigné, afterwards notable as Mme. de Maintenon (q. v.). She was then a girl of sixteen, glad to save herself from a convent by marrying a cripple with whom she had not a taste in common. Her influence on his life was for good, however, and at his table she introduced something like decorum. Of S.'s works (collected by Bruzer de la Martinière (10 vols. Par. 1739; new ed. 7 vols. 1786), the only two now read are his *Virgile Travesti* (1648-52), an intensely comical parody which gave rise to numberless continuations and imitations, and the *Roman Comique* (1651). Both have been trans-

lated into English. Within a few minutes of his death S. said to his tearful attendants, 'My good friends, I shall never make you weep so much for me as I have made you laugh.' His last words were characteristic, 'I could never before believe it so easy to laugh at death.' S. died October 16, 1660. See Segrais, *Mémoires Anecdotes*; Th. Gautier, *Les Grotesques*; and D'Avalon, *Scarroniana*.

Scarus, a genus of Teleostean fishes, including those species which browse on coral-polypes, and which are named 'Parrot fishes.' They are allied to the *Labridæ* or Wrasses, and their jaws are incrustated with numerous minute teeth.

Scaup Duck (*Nyroca marila*), a species of *Anatida* or ducks, allied to the Pochard (q. v.), and found in northern regions in summer, but migrating far S. in winter. The bird attains a size equal to that of the pochard. Its colour is black on the head, neck, and back, the hinder parts being white, whilst a rich green glosses the cheeks. The under parts are white. The female has brownish tints.

Scep'ticism (Gr. *skeptomai*, 'I doubt, or consider') is that negative species of philosophy which distrusts the power of consciousness to tell of ought beyond self, and consequently denies the possibility of a complete theory of existence. As soon as dogmatism had set its seal on the speculations of Socrates, Plato, and Aristotle, the sceptical school of Pyrrho arose in opposition, and proclaimed that man was surrounded by the incomprehensible. From Pyrrho's time to that of Hume great doubters have ever questioned the great dogmatists; and at the present day the physiologists have driven philosophy proper into an attitude that can only be called S.

Sceptre (Lat. *sceptrum*, Gr. *skēptron*, from *skēptō*, 'I lean'), an ornamental staff carried by sovereigns from remote times as an emblem of supreme power and dignity. The Hebrew word translated S. in the Old Testament, signifies, in its original sense, a long plain staff, and probably it was first adopted as a badge of authority by the early nomad rulers. In ancient Greece the S. was borne by kings and princes, and as a badge of office by judges, heralds, priests, and magicians. Oriental monarchs inclined the S. as a mark of favour, and submission to them was expressed by kissing the S. Gold and jewel-stones have long been used in the construction of the S., which was early surmounted by a distinctive figure or emblem, as, for example, the eagle chosen by the Roman monarchs. The S. has varied much in form in different countries at different periods.

Schad'ow, Johann Gottfried, a German sculptor, was born at Berlin, 20th May 1764, and after studying at Rome was appointed, in 1788, secretary to the Academy of Art in Berlin, where he died 27th January 1850. He modelled the quadriga of the Brandenburg Gate, Berlin; and among his chief works are statues of Ziethen in Berlin, Friedrich the Great in Stettin, Blücher in Rostock, and Luther in Wittenberg.—**Rudolf S.**, eldest son of the preceding, born 9th July 1786, was a student of Thorwaldsen and Canova, and subsequently a disciple of the Romantic school, under the influence of which he produced many finely-fancied mythological groups. He died 31st January 1822.—**Friedrich Wilhelm S.**, another son, was born 6th September 1789. After receiving his first lessons as a painter from Weitch, he went in 1810 to Rome, where he met Overbeck, Cornelius, and Veit, and became a convert to the Roman Catholic faith. He was made a professor in the Berlin Academy (1819), and director of the Düsseldorf Academy in place of Cornelius (1826). His fame attracted to the 'Düsseldorf school' such pupils as Lessing, Karl Sohn, Th. Hildebrandt, Rethel, and Hübner. He was a leader of the Romanticists, and among his principal works are 'The Four Evangelists,' 'Christ on the Mount of Olives,' 'The Ten Virgins,' and 'The Fountain of Life.' S., who showed little aptitude for 'high art,' was a master of subtle, conscientious methods, and a humble worshipper of nature. He wrote *Ueber den Einfluss des Christenthums auf die bildende Kunst* (1842) and *Der Moderne*

Sceptre.

Vasari (1854). In 1843 he was made a Prussian peer, with the title Von S.-Godenhau. He died 19th March 1862.

Schäfer, Johann Wilhelm, was born at Seehausen, near Bremen, September 17, 1809. He studied at Leipzig for four years, and became in 1831 assistant-teacher, and in 1834 professor in the chief school of his native town. Here he wrote his valuable works on the literature of Germany, of which the chief are *Handbuch der Geschichte der deutschen Literatur* (1842-44; 2d ed. 1855); *Tabellen zur Geschichte der deutschen Literatur* (1853; 2d ed. 1869); *Geschichte der deutschen Literatur des 18 Jahrh.* (3 vols. 1855-57; 2d ed. 1859); *Schiller* (1853); *Goethe's Leben* (2 vols. 1851; 2d ed. 1858); *Literarische Bilder* (1861; 2d ed. 1873); and *Zur deutschen Literaturgeschichte* (1864). He also edited Oeser's *Geschichte der deutschen Poesie* (1859; 3d ed. 1871).—His brother, **Arnold Dietrich S.**, was born at Seehausen, October 16, 1819, was made professor of history in Greifswald University in 1858, and since 1865 has occupied a similar position in Bonn 'Hochschule.' Among other historical works he has written *Demosthenes und seine Zeit* (3 vols. 1856-58), *Abriss der Quellenkunde der griech Geschichte bis auf Polybius* (1867), *Geschichte des Siebenjährigen Krieges* (2 vols. 1867), and *Die Hansa und die Nord-deutschen Marine* (1869).

Schaff, Philip, LL.D., was born at Coir, Switzerland, January 1, 1819. He studied at Coir, Stuttgart, Tübingen, Halle, and Berlin, where he graduated B.D., and subsequently (1842-44) lectured in the university on exegesis and Church history. In 1844 he was called to America as professor in the theological hall of the German Reformed Church at Mercersburg, Pennsylvania. In 1863 he removed to New York, and in 1870 became professor of sacred literature in the Union Theological Seminary in that city. He is a member of various historical and literary societies in Europe and America, is an active promoter of the Evangelical Alliance, and president of the American Bible Revision Committee. His chief works are *The Principle of Protestantism* (1845), *Life of St. Augustine* (1853), *History of the Apostolic Church* (1853, Leips. 1854, Edimb. 1855), *Person of Christ, with a Reply to Strauss and Renan* (1865), *History of the Christian Church from A.D. 1-590* (3 vols. 1867, to be continued), *The Vatican Council* (1875), *History and Collection of the Creeds of Christendom* (3 vols. 1876), and *Bibliotheca Symbolica Ecclesiæ Universalis* (3 vols. 1877). S. is also editor of the Anglo-American reproduction of Lange's *Critical, Theological, and Homiletical Commentary on the Bible* (24 vols. 1864-78), and joint-editor of *The Philosophical and Theological Library*, begun in 1873.

Schaffhausen, the most northern and one of the smallest of the Swiss cantons, lies in three portions on the right bank of the Rhine, and is bounded N.E. and W. by the Grand Duchy of Baden, and on the S. is separated by the Rhine from the cantons of Zürich and Thurgau. Area, 113 sq. miles; pop. (1876) 35,925. The surface is hilly in the centre, and is occupied in the N. by the Randen range (rising to 3000 feet), and in the N.W. by the Klettgauberge. It is drained by the Rhine and its feeders, of which the Bache is the principal. The soil is uniformly fertile; 40,000 acres are arable, and yield abundantly corn and potatoes. Good wine is produced in the Klettgau district. 22,233 acres are occupied with wood, and 6225 acres are meadow pasture. There are manufactures of silks, files, cast-steel wares, and enamelled tiles. S. sends two members to the National Council, and is governed by a great council renewed by ballot every four years.—S., the capital of the preceding Canton, on the right bank of the Rhine, is 60½ miles E. of Basel by rail. It has still the mediæval appearance of a Swabian imperial town, and has walls, many quaint old gabled houses, a college, and a citadel erected in 1564. Its cathedral (1104-1453) is a fine basilica; the Johanniskirche was founded in 1120. The library (Bürger-Bibliothek) contains more than 20,000 vols., and the MSS. of the famous Johann von Müller (q. v.), who was born here in 1752, and to whom a monument has been erected on the Vesenstaub. S. has manufactures of ironware and silks. Pop. (1870) 10,303.

Schall, Johann Adam von, a celebrated missionary, was born at Köln in 1591. He entered the Society of Jesus in 1611, and after several years' study was sent as a missionary to China in 1622. His great scientific reputation led to his being called

in 1631 to Peking, where he was intrusted with the revision of the Chinese calendar, then in complete confusion. S. rose rapidly in the favour of the emperor, to the disgust of the court officials, and had the same good fortune under his successor, Shun-Tchi, the founder of the Manchu Tartar dynasty (1647), whom he even induced to sanction the erection of a great Catholic church at Peking, and permit the free preaching of Christianity throughout the empire. The converts of S.'s mission numbered, it is said, 100,000. The tide turned, however, during the minority of Khang-Hi, when S. was twice imprisoned, and his assistants were banished to Tartary. He died in prison, August 15, 1669. Fourteen MS. vols., written in Chinese by S., are preserved in the Vatican Library. See Huc, *Le Christianisme en Chine*, vols. ii. and iii. (Par. 1857-58).

Scham'yl. See SHAMYL.

Scharnhorst, Gerhard Johann David von, a Prussian general, was born at Hamelsee, in Hanover, November 12, 1756. He entered the Hanoverian army in 1776, was made teacher in an artillery-school (1782), and served against France as chief of a battery in 1793. In 1801 he entered the Prussian service, and became director of the military academy of Berlin. Raised to the staff in 1804, and subsequently to the rank of a general, he was present at the battles of Auerstadt and Eylau. After the Peace of Tilsit in 1807, he was placed at the head of the administration of Prussian military affairs. Together with Gneisenau he skilfully evaded the provision in the Treaty of Paris (1808), limiting the Prussian army to 42,000 men, and by training fresh bodies of men in relays, raised the number actually to 271,000. He accompanied Blücher as chief of the staff in the campaign of 1813. On May 2, 1813, he was wounded at Grossgorschen, and died June 28 of the same year at Prague when on his way to Vienna to persuade Austria to join the allies against Napoleon. His chief works are—*Handbuch für Offiziere* (3 vols. 1797-1800; new ed. by Hoyer, 4 vols. 1817-20), *Taschenbuch für Offiziere* (1793; 4th ed. 1816), and *Militärischen Denkwürdigkeiten* (5 vols. 1797-1805). See Ranke's *Historisch-polit. Zeitschrift* (vol. i.), Boyen's *Beiträge zur Kenntniss des General S.* (Berl. 1833), the biographies by Schweder (1865) and Klippel (3 vols. 1869-71), and Lehmann's *Stein, S. und Schön* (Leip. 1877).

Schässburg (Magyar *Segervár*), a town of Austria, in Siebenbürgen, on the Great Kokel, has woollen manufactures, and is the centre of a rich agricultural district. The older portion of the town dates from before 1280. Pop. (1870) 8204.

Schaumburg-Lipp'e. See LIPPE.

Scheele, Karl Wilhelm, a celebrated Swedish chemist, was born at Stralsund, December 19, 1742. He was apprenticed to an apothecary in Gothenburg, removed to Malmö in 1765, to Stockholm in 1767, and six years later settled at Upsala, where he became the friend of Linnæus and Bergmann. Here the greatest of his many discoveries were made, including nitrogen, oxygen (discovered previously by Priestley), and chlorine. Tartaric acid he had discovered in 1770 at Stockholm. In 1777 he bought an apothecary business at Koping, near Stockholm, where he continued to add to his fame as a chemist, and where he died, May 21, 1786. He investigated the properties of many organic acids, thoroughly separated the compounds of varium and manganese, and analysed fluorspar, Prussian blue, and atmospheric air. His collected works were published by Hermstadt (Berlin, 1792).

Scheele's Green, a pigment of a vivid light-green colour, is a cupric arsenite which is precipitated from a mixture of arsenious acid and sodium carbonate in water on adding cupric sulphate. Scheele first prepared it in 1778. It is soluble in dilute acid and caustic alkalies; with ammonia it assumes a blue colour. S. G. is used as an artist's pigment, and in colouring paperhangings, artificial flowers, and toys. *Swedish green* is a synonym of S. G.

Scheff'er, Ary, a French painter of the Romantic school, was born at Dordrecht, Holland, 10th February 1795. His father was a German painter, his mother a native of Dordrecht, and he was educated at Lille. He exhibited in the Amsterdam salon when only twelve years of age, and after his father's death (in 1811) removed to Paris, where he entered the Atelier of Guérin.

Facile and fanciful, he threw off many popular *genre* pieces, such as 'La Veuve du Soldat' and 'La Sœur de Charité,' but it was not till the rise of the Romantic school that he acquired his great fame as a delineator of tender sentiment in exquisitely pale, pure harmonies of colour. Among his best-known works are the Faust series (nine in number), 'Mignon,' 'Paolo et Rimini,' 'Gaston de Foix,' 'Dante et Beatrice,' and the 'Femmes Suliotes.' His later works are of a religious character, such as 'Le Christ Consolateur,' 'Le Christ au Jardin des Oliviers,' 'Les Bergers conduits par l'Ange,' and 'St. Augustine et Monique.' He painted portraits of Marie Amalie, wife of Louis Philippe, Lafayette, Beranger, Lamartine, Lord Dufferin, &c. Most of his works were widely circulated by engraving even during his lifetime. A republican, yet a close friend of royalty, S. was concerned in the Carbonari conspiracy of Béfort in 1822, fought at the barricades in the 'glorious days' of July 1830, was deputed, along with Thiers, then *redacteur en chef* of the 'National,' to offer the crown to Louis Philippe, and conducted the dethroned sovereign and the royal party from the Tuileries in 1848. He died, 15th June 1858. S. has been called the poet-painter, and the epithet refers to a certain pensive, mystic feeling which appears in all his works. A statue of A. S. was erected at Dordrecht in 1862. See Mrs. Grote's *Memoirs of A. S.* (Lond. 1860).

Scheldt, The (Fr. *l'Escaut*, Lat. *Scaldis*), a river of France, Belgium, and Holland, rises in the department of Aisne, about 11 miles N.E. of St. Quentin, flows northwards past Cambrai, Valenciennes, and Condé, enters Belgium near St. Antoine, where it becomes navigable, passes, still in a northerly course, Tournay, Oudenarde, and Ghent, then turns to the N.E. and passes Dendermonde, Rupelmande, and Antwerp, after which it resumes its northern course, and after entering Holland is divided into its two mouths, the Easter and Wester S., by the islands of N. and S. Beveland and Walcheren. On its eastern estuary is Flushing, and on its western Bergen-op-Zoom. Its whole length is 248 miles, of which 74 are in France, 138 in Belgium, and 36 in Holland. At Antwerp it is 1690 feet wide and 46 feet deep. Its principal tributaries are the Lys, Dender, and Rupel, and it forms the centre of a system of canals extending throughout Belgium. A treaty signed in 1839 gave Holland the right to levy a toll of 2s. 6d. per ton on all vessels entering the S., but in 1863 this right was bought up by various trading powers for the sum of £750,000, of which Great Britain contributed £35,000.

Schelling, Friedrich Wilhelm Joseph, one of the most eminent metaphysicians of his time, was born at Leonberg in Württemberg, 27th January 1775. In his fifteenth year he began the study of philosophy in the theological seminary at Tübingen, and obtained the degree of Master of Arts when he was only seventeen, with a dissertation on the Mosaic account of the Fall, in which there are traces of that mythical theory which was afterwards adopted and applied by David Strauss, in the first edition of his *Leben Jesu*. On completing his university career, S. became first a private tutor at Leipsic, and afterwards a professor in the University of Jena, where he edited, along with Hegel, the *Kritische Journal für Philosophie*. After an interval of several years, he was elected president of the Academy at Munich (1807), in succession to Jacobi, and in 1841 became a professor at Berlin. He died at Ragatz, 20th August 1854.

S.'s philosophical views underwent so long a course of development, and passed through such different stages, that in order to understand their connection it is necessary to trace them in relation to the influences under which he himself from time to time came. In his early years he was converted from the system of Kant to that of Fichte, and became indeed, for a time, the expositor and commentator of the latter. Fichte, followed by S., had rejected the doctrine of Kant that there were elements in knowledge besides those contributed by the knowing subject, and that there was a raw material of sensation presented to mind by things in themselves. These Fichte declared to be meaningless abstractions; and constructed a theory of knowledge in which the Ego is entirely creative of its object, being impelled thereto by the moral necessity of realising itself in the practical sphere. In his book *Von der Weltseele* (1798), S. shows symptoms of dissatisfaction with this theory, and attempts to claim for nature a less secondary position than that of the mere product of an intelligence which is after all more or less individual; and in his *System des Transcendentalen Idealismus* (Tüb. 1800) he completely breaks

away from Fichte, asserting Nature to stand as high on the platform of logical reality as Intelligence, and finding an Absolute Existence underlying and embracing both within itself. We can here trace the influence of Spinoza, to whose metaphysics S. was at this time giving great attention. The difference between Spinoza's system and that of S. was that the latter was essentially a theory of knowledge, which was only logically transcended by an Absolute which was simply the pure indifference of Ideality and Reality, while the former was in effect a treatment of the Absolute as a possible object of knowledge, being thus dogmatic in the sense which Kant attached to that word. S., while he avoided dogmatism in recognising a theory of knowing as the foundation of all philosophy, failed to reach the highest development of German metaphysics in treating the Absolute as substance instead of as subject. (See the introduction to Hegel's *Phänomenologie des Geistes*.) His philosophy was now a system of objective Idealism, in which Nature and Mind were alike real as being logical aspects of the Absolute, but he had not got over the difficulty of finding a method for transcending the two former and rising to the latter. It is in the third period of his philosophical history that he first does so, in the conception of an 'Intellectual Intuition or Perception,' in which identity is assumed not between Thought and some particular sensuous existence as in ordinary perception, but between Thought and All Being in general. The influence of Jacobi is prominent here, and still more so that of Boehm. In the *Darstellung*, the essential identity of all forms of existence in the universes both of mind and of matter is worked out with great minuteness; subjectivity and objectivity being treated as the two poles of Absolute Impersonal Reason.

S.'s later works exhibit more or less the influence of his great rival Hegel, and contain a great deal of mysticism, the result of his failure to find a satisfactory formula for the expression of his theory of Absolute Knowledge. In his *Vorlesungen über die Methode des Akademischen Studiums*, there is a popular account not only of his metaphysics, but also of his views on ethics and religion, in relation to which he is best known as having first expounded that mythical theory which was applied to the historical criticism of Christianity by Strauss and the Hegelians of the Left.

S.'s collected works were published after his death at Stuttgart in 14 vols., edited by his sons. The best historical accounts of his systems are those in the large histories of later German philosophy by Michelet and Erdmann, in Professor Kuno Fischer's *Geschichte der Neueren Philosophie*, in C. Rosenkranz's *Vorlesungen gehalten im Sommer 1842 an der Universität zu Königsberg*, in Marheineke's *Kritik der Schellingschen Offenbarung's philosophie*, and Von Hartmann's *S.'s Positive Philosophie als Einheit von Hegel und Schopenhauer*. There are some translations from S. in the *Journal of Speculative Philosophy*, published at St. Louis. His life has been written under the title *Aus S. Leben* (Leip. 1869). See also Fichte's and S.'s *Philosophischer Briefwechsel*, edited by K. F. A. Schelling and F. H. Fichte (Stuttg. 1856).

To the English student S.'s philosophy presents, perhaps, even more difficulties than that of Hegel. There is an element of mysticism which removes it further from the platform of empiricism than even the Abstract Dialectic of the latter. The easiest way of approaching it is, perhaps, after a preliminary study of Fichte, to read the *System des Transcendentalen Idealismus* and the *Vorlesungen über die Methode des Akademischen Studiums*, although these books, properly speaking, belong to different periods.

Of S.'s disciples it is only necessary to mention one or two of the most important, as his school was quickly absorbed into that of Hegel. Rixner, the author of the *Geschichte der Philosophie*, and Troxler were among the most prominent of his pure adherents, but certainly the most distinguished of those who received his ideas was Krause, who afterwards published a system of metaphysics in which the doctrine of Identity was developed into a theory of Pantheism. Franz von Baader (of whose system Professor Baumann has just published an interesting account in the *Philosophische Monatshefte* (B. xiv., Heft 6), carried out the mystical side of his Philosophy into a Theosophy which is more theological than metaphysical, but which has none the less on that account left a permanent impression upon the history of German thought. His collected works have been edited by Hoffman, and published at Leipsig in 16 vols. Lorenz Oken, Nees von Esenbeck, Karl Friederich Burdach Carus, and Oersted, all became

well known in connection with the theory of natural philosophy, which they worked out into its speculative and experimental applications in the departments of physiology and physics. Eschenmayer and Görres became prominent on account of their strenuous attempts to ground Apologetic Theology upon the system of Identity; while Steffens, in opposition to Görres, who was an adherent of Roman Catholicism, became an advocate of the strictest Lutheranism.

S.'s disciples soon, however, ceased to exist as a school owing to internal dissensions. As a system his philosophy is now practically extinct in Germany.

Schenectady, one of the oldest cities in the state of New York, U.S., 17 miles W. of Albany by rail, on the Mohawk River and Erie Canal. It has 16 churches, good educational institutions, the chief of which is Union College, public halls, and a park. There are large locomotive works, foundries, knitting-mills, planing-mills, and carriage factories. S. has 6 newspapers (1 German). Pop. (1870) 11,026.

Schenkél, Daniel, a celebrated German theologian, was born at Dogerlin in Zurich, 21st December 1813. He studied theology at Basel and at Göttingen, and became a 'privat-docent' at Basel in 1838. In the following year he took part in the controversy concerning Strauss's call to Zürich with the pamphlet *Die Wissenschaft und die Kirche: Zur Verständigung über die Strauss'sche Angelegenheit*. He was successively appointed chief pastor of the cathedral at Schaffhausen (1841), professor of theology at Basel (1849), and in 1851 professor of theology, first university preacher, and director of the theological seminary at Heidelberg. S.'s writings during this period—24 *Predigten über Grund und Ziel unseres Glaubens* (2 vols. Zürich 1843-44), polemics against Gervinus on 'German Catholicism' (from 1846), and *Das Wesen des Protestantismus aus den Quellen des Reformationszeitalters beleuchtet* (3 vols. Schaffh. 1846-51; 2d and revised ed. 1862)—bear the stamp of his peculiar 'positive' theology, though their tendency is towards mediation between the opposite Protestant parties. In 1854 he keenly opposed the philosopher Kuno Fischer's call to Heidelberg, and from 1852 to 1859 he acted as co-editor of the *Allgemeine Kirchenzeitung*, the organ of the moderate unionist party. The hostilities between orthodox and liberal churchmen growing bitter in Baden, S. gradually identified himself with the latter. The 'Oberkirchenrath' having issued in 1858 a new 'Kirchenbuch' of a strongly dogmatic spirit, it was successfully attacked by S.'s party. A liberal ministry and Oberkirchenrath succeeded the old (1859), and the Synod of 1861 granted a new church constitution on the 'Gemeinde Principle,' giving the laity great influence in church affairs. S.'s increasing sympathy with liberal views was apparent in his *Christliche Dogmatik* (2 vols. Wiesb. 1858-59), and his founding (1859) the *Allgemeine Kirchliche Zeitschrift*, a decidedly liberal organ, which led (1853) to the establishment of the 'Protestantenverein.' The most important work of S. is his *Charakterbild Jesu* (Wiesb. 1864; 4th and revised ed. 1873; Eng. trans. by W. H. Furness, 1866), an attempt to represent Jesus as the product of a development purely human, and to explain the story of his resurrection as due to visions of his disciples. This called forth numerous 'Protestadressen,' but the Baden government refused to remove S. from his professorship. Among S.'s other works are *Gespräche über Protestantismus und Katholicismus* (Heidelb. 1852, et seq.), *Unionsberuf des Evangelischen Protestantismus* (ib. 1855), *Die Reformatoren und die Reformation* (Wiesb. 1856), *Die Protestantische Freiheit in ihrem gegenwärtigen Kampfe mit der kirchlichen Reaction* (ib. 1865), *Christenthum und Kirche im Einklang mit der Culturentwicklung* (ib. 1867), and *Friedrich Schleiermacher* (1868). Since the decease (1872) of the *Allgemeine kirchliche Zeitschrift* and the transference of the headquarters of the 'Protestantenverein' to Berlin, S. has almost retired from the struggle. He has recently edited a *Bibel Lexikon* (Leip. 1868-75), and a revision of his *Christliche Dogmatik* under the title of *Die Grundlehren des Christenthums aus dem Bewusstsein des Glaubens im Zusammenhang dargestellt* (Leip. 1877), displays the complete revolution in his religious views.

Scherz'o (Ital. 'a jest'), a sportive playful movement in a sonata or symphony. In Beethoven's symphonies it superseded the minuet, but before his time was used by Haydn, Bach, and others in quartettes and suites.

Scheveningen, a fishing town and watering place of Holland, province of S. Holland, on the North Sea, 3 miles N.W. of the Hague, with which it is connected by a tramway opened in 1864. It is defended from the sea by a range of sand-hills, and has a summer residence for the king and several excellent hotels. The industries are boat-building, rope-spinning, the making of sailcloth, and extensive fisheries. In 1876 it had 181 vessels with 1514 men engaged in the North Sea fisheries. In 1875 were produced 16,936,550 'steur' or smoked herrings valued at £29,688, and 36,979,350 salt herrings valued at £72,795. Pop. (1869) 7713.

Schiedam, a town in South Holland, on the Schie, which is connected with the Maas by a canal, 3½ miles W. of Rotterdam by rail. S. is the great centre of the gin manufacture, and had, in 1871, 271 distilleries, producing annually 8,082,030 imperial gallons, one-third of which is exported. It had also 60 malthouses and 20 cooperages. Upwards of 30,000 swine, besides cattle, are fed from the refuse of the distilleries. In the stearine factory, in the same year, were used 2946 tons of tallow and palm-oil in the production of 1208 tons stearine, 638 tons of candles, 874 tons of oleine, and 81½ tons of glycerine. Pop. (1877) 21,880.

Schill'er, Johann Christoph Friedrich von, after Goethe the greatest of modern German poets, was born at Marbach, on the Neckar, November 10, 1759. Both his parents were people of high moral character, and pious and cheerful in their disposition. S. was educated first at the parish school of Lorch, and then, intending to enter the Church, he studied at the public school of Ludwigsburg. Circumstances having altered this intention, the boy enrolled himself in 1773 at the Stuttgart Karlschule with a view to the legal profession. In two years he changed law for medicine, and having completed the prescribed course, he was appointed in 1780 a regimental surgeon in the Würtemberg army. Whilst holding this post he published *Die Räuber*, a work which, testifying as it did to the appearance of a great genius upon the field of letters, excited much interest. Several causes made his position at Stuttgart uncomfortable, and it was not made better by the appearance of *Die Räuber*. In October 1782 he left his post. The rest of his life was entirely devoted to literature. Within a year he published two dramas, *Die Verschwörung des Fiesco* and *Kabale und Liebe*, which were represented with great favour at the Mannheim theatre. In 1783 he removed to Mannheim as poet to the theatre. Here he published the *Thalia* (1785-94), a magazine devoted to the interests of the stage. It contained disquisitions, part of *Don Carlos*, *Infant von Spanien*, and many of his smaller poems. The *Philosophische Briefe*, an interesting record of the religious doubts and difficulties that agitated the author's mind, belong also to this period. After an eighteen months' stay at Mannheim he went to Leipzig in March 1785. Here he worked at *Don Carlos*, which was published in 1786. During the next few years he led a somewhat migratory life. He stayed some time at Dresden with Körner, who was subsequently his biographer. At Weimar, where he afterwards went, he was cordially received by Wieland and Herder. On a return visit he was introduced to Goethe, and a warm attachment immediately sprang up between these two great men. This attachment ripened into a friendship the most enduring, constant, and beautiful in modern literary history. Through the influence of his friend S. received in 1789 the appointment of professor of history at the University of Jena. His literary activity during these wandering years had been considerable. He wrote part of a novel, never afterwards finished, entitled the *Der Geisterseher*, and then, turning his attention to historical subjects, he produced the *Geschichte des Abfalls der Vereinigten Niederlande* (1788). Shortly after his appointment he married the Fräulein Lengefeld, and during the fifteen years of life that now remained to him settled down to steady literary toil. Continuing his historical studies, he produced in 1791 his *Geschichte des Dreissigjährigen Kriegs*. The same year his health, never very good at the best, completely gave way. He was ordered to cease all literary activity for some time to come. A pension of a thousand crowns for three years, which the Duke of Holstein-Augustenburg and another German noble conferred on him, relieved him from the fear of want, and it seemed to be not merely his privilege but his duty to cease from work. Of one thing he certainly became

free; his connection with the university was thereafter merely nominal. But he only left one kind of toil to engage in another. Had he then ceased his literary labours the world would have been without the greatest of his works, for his most fruitful years of life were just those in which he was most weighed down by bodily suffering. He engaged in profound study of the philosophy of Kant, especially in its æsthetic and moral side; he discontinued the *Thalia*, and, assisted by Goethe, issued the *Horen* (1795-97), and a more popular magazine entitled the *Musen Almanach*. In this last were published from time to time the *Xenien*. These were a number of epigrams containing principles of criticism and severe hits at many literary men of the day. They were written both by Goethe and S. In 1800 the poet resolved to spend his winters in Weimar and his summers in Jena. Shortly before he left the latter place for the season *Wallenstein* was published. This was followed by *Maria Stuart* in 1800, *Die Jungfrau von Orléans* in 1801, the *Braut von Messina* in 1803, and *Wilhelm Tell* in 1804. This was his last work. Afflicted by physical pain, yet strong in the midst of weakness, he had diligently used his allotted span. While projecting great plans for the future, contemplating the production of some work that might perhaps surpass even *Wallenstein*, his course was cut short by death at Weimar, May 9, 1805.

The works of S. fall naturally and conveniently into three groups: (1) his dramas; (2) his briefer poems; (3) his prose works. As to the first of these, *Die Räuber* narrates the adventures of Karl Moor, a young man of noble birth who is driven from his home through the treachery of a brother; becomes captain of a band of banditti, and in his fall destroys with himself those whom he loved. The action is impetuous, the story and characters alike improbable, but a certain wild strength carries the reader away. The defects are forgotten or forgiven for the sake of striking beauties of thought and diction with which the piece abounds. In *Don Carlos* we have the first of a series of historical plays. The story with some variation is taken from Spanish history, but one of the noblest characters, the Marquis of Posa, is quite imaginary. *Wallenstein* is a drama founded on the last days of the hero of that name. This, the greatest of S.'s works, is a trilogy. The first part, 'The Camp,' gives a vivid picture of the dissolute yet brave and experienced army which the great general had collected. The second, 'The Piccolomini,' describes the beginning of the plot and counterplot of which the issues are given in the third part, entitled 'The Death of Wallenstein.' Here the wild passion of *Die Räuber* is succeeded by serene yet mighty strength. The complex feelings that stir men's minds in a great crisis are powerfully portrayed, whilst the picture of Wallenstein, a mind great even in its excesses, a mixed character, with great faults and great merits, charms and delights the reader. The love-scenes between Thekla the daughter of Wallenstein and Max Piccolomini have been blamed by some critics, but they are not really inconsistent with the plan of the work. In a mighty drama there ought to be place for the exhibition of all the great human passions, and the 'silver cord' that love winds among the intrigues of statecraft and war adds an indescribable charm to the whole. *Maria Stuart* and *Die Jungfrau von Orléans* are likewise, as their names imply, historical dramas. In the first the character of Mary is unduly exalted at the expense of that of Elizabeth, but in the second the heroine is painted such as history tells us she must have been. She is indeed represented as forgetting for a moment her divine mission in human love, but her character immediately reasserts itself, and she falls dying, but victorious. Of his last work, *Wilhelm Tell*, the plot is too well known to require re-statement. It is a noble subject nobly treated. Of the shorter poems of S., the lyrics are certainly inferior to those of Goethe or Heine. They do not strike one as expressing that perfect utterance of one single sentiment in which the lyric properly consists, yet they are finely and melodiously written. In the ballad style he was particularly successful, especially when, as in the 'Diver,' some brief and touching incident is to be related. *Das Lied von der Glocke* and *Die Götter Griechenlands* are perhaps his best. The first describes the casting of a bell, and touches on the various human emotions which its ringing will express. The second is a poet's wail over departed beauty. It is a poem touching and beautiful in the highest degree.

Of the prose works of S., the principal are his *Geschichte des Abfalls der Vereinigten Niederlande* and *Geschichte des Dreissigjährigen Kriegs*. They are written in a clear and entertaining

style. Historical perspective is well observed, and while we have the noblest enthusiasm for freedom, justice, and progress, there is yet perfect impartiality preserved. The great characters who appear on the stage are described as only a great genius could describe them. The histories are not meant to enter into minute and exhaustive detail, but certainly as general histories of the period they surpass anything that has yet been written on the subject.

Although S. must be pronounced inferior to Goethe, yet we cannot wonder that his general popularity has been greater. He deals with subjects universally interesting—the struggle of a great nature with a hard fate and cruel fortune, a mind filled with a lofty enthusiasm for a great mission, or perhaps a heart divided against itself, anxious to do right, and yet induced to do wrong. His own character is reflected in all his writings. He loved what was good and true too ardently to look with indifference even on their representation. He could not contemplate the sins and sorrows of humanity with the artistic calmness of Goethe or the cynical scorn of Heine. A passion for all that is great and right breathes through his writings and inspires his readers. The nobleness of his character compels our respect. It is true he was destitute of humour, and compared to Goethe he is one-sided and seems even narrow, but it is so because he does not look around him, but ever onwards and upwards to what is eternally true and just and beautiful.

A voluminous literature has gathered round the name of S. The first collected edition of his writings appeared in 12 vols. at Stuttgart and Tübingen (1812-15); and supplemental collections were published by Boas, Döring, and Hoffmeister. Gödeke edited a complete critical edition, assisted by Elissen Ortivley, Vollmer, &c. (15 vols. Leips. 1867-77). S.'s correspondence with Goethe appeared in 1828 (fuller ed. 1856; Eng. trans. 1st vol. 1877), with Fichte in 1847, with Körner in 1847, with Wilhelm von Humboldt in 1830. Lives of the poet have been written by Thomas Carlyle (1825), Karoline and Wolzogen (1830; 4th ed. 1851), Hoffmeister (1838-42), Schwab (1840; new ed. 1859), Boas (1856), Palleske (1858-59; 5th ed. 1872), Gödeke (1859), Viehoff (Stuttg. 1874). Among the more interesting recent contributions to the subject are Philip Ulrich's *Charlotte von S. und ihre Freunde* (3 vols. 1860-65); *Geschäftsbriege S.'s*, edited by Gödeke (Leips. 1875), *S.'s Briefwechsel mit dem Herzog von Schleswig-Holstein Augustenburg*, edited by Max Müller (Berl. 1876, embodied in the *Chips from a German Workshop*, vol. iii.). A S. Fund was founded in Germany on his centenary (1859), and the capital, several thousand thalers, yields annually an income to some twenty needy authors. Of fifteen monuments erected to S., the latest was unveiled at Vienna, 9th May 1877.

Schinkel, Karl Friedrich, a German architect, was born at Neuruppen, 13th March 1781. In 1795 he went to Berlin, where he was taught drawing by Professor Gilly, on whose death he was entrusted with the continuation of his teacher's unfinished architectural plans. In 1803 S. travelled to Italy and Sicily, and in 1805 he returned through France to Berlin, deeply impregnated with the spirit of classic art. But political troubles interfered with all great building operations, and S. devoted himself to painting and to a study of the relations between architecture and landscape. When the court returned to Berlin, S. designed additions to the royal palace, and in 1810 he became assessor to the Board of Works. In 1811 he was made associate of the Academy of Arts, in 1819 superintendent of the technical department in the Ministry of Public Works, and next year professor in the Academy of Arts. He died October 9, 1841. His works are very numerous. In Berlin he designed the Royal Guard-House (1818), the Theatre (1819-21), the Schlossbrücke (1828), the Academy of Architecture (1835), the church of St. Nicholas (1830-37), the Old Museum (1834-38), much of the splendid Wilhelmstrasse, and many other monuments and public buildings not only in Berlin and Potsdam, but throughout the country. S. revived classical architecture in Germany, and his work has been much criticised by the devotees of Gothic art. His success as a painter and sculptor proves the manysidedness of his genius. His works are collected in the S. Museum at Berlin. His writings included a *Sammlung architektonischer Entwürfe* (1820-37), *Grundlagen der praktischen Baukunst* (1834), *Werke der höheren Baukunst* (1845). See Kugler's *Kleine Schriften* (vol. iii.), Waagen's

S. als Mensch und als Künstler (1844), Böttcher's *S. und sein Baukünstlerisches Verhältniss* (1857), Wolzogen's *S. als Architekt, Maler, und Naturphilosoph* (1864), and Grimm's *S. und die Anfänge modernen Kunst* (1867).

Schi'nus, a genus of trees and shrubs, natives of S. America. They have unequally pinnate leaves, with a long terminal leaflet; small white dioecious flowers, arranged in panicles, and a round succulent fruit. As with many other plants of the order *Anacardiaceæ*, a resinous principle pervades the species of *S.* This, in the case of the leaves of *S. molle*, when they are torn and thrown into water, is discharged with such force as to cause the appearance of spontaneous motion by the recoil.

Schism (Gr. *schisma*—*schizō*, 'I split'), a division or separation in a church on a point of doctrine or discipline. Among the chief of the earlier schisms are the Ebionite (2d and 3d centuries), the Novatian (251 A.D.), Miletian (305), Donatian (311), Arian (first under Damasus, 355; second under Miletian, 361), Nestorian (428), and Monophysite (482). The **Greek S.**, begun in 858, arose out of the hierarchical rivalry and the conflicting claims of East and West, as represented by Pope Nicholas I. and Photius, Patriarch of Constantinople. The rupture was completed by mutual excommunication in 1054. (See GREEK CHURCH.) There were papal schisms concerning the election of the Pope in 963, 1159, 1164, and 1178; but of greater importance than any of these was the so-called **Western S.**, between the rival courts of Avignon and Rome. Urban VI., who was elected Pope April 1378, so exasperated most of his cardinals by his severity, that they elected a rival Pope—Clement VII. (September 1378). As most of the Italians were in favour of Urban, Clement betook himself to Avignon, and there was fighting in Italy between the supporters of the two. Urban was succeeded by Boniface IX. (1389), Innocent VII. (1404), Gregory XII. (1406), and Alexander V. (1409); and Clement by Benedict XIII. (1394). Notwithstanding various attempts at reconciliation on the part of the European princes, as well as of the cardinals, the *S.* continued till 1409, when both Popes were deposed by the Council of Pisa, and Alexander VI. elected. Benedict XIII., however, remained in *S.* till his death in 1424.

Schisma, a small musical interval, the approximate half of a Comma (q. v.).

Schist (Gr. *schistos*, 'split'), a somewhat indefinite term applied to various fissile foliated rocks of the Metamorphic series, the foliation or splitting being due not to mere stratification, as in shale, &c., but to the arrangement of the component minerals. *Mica-S.* consists of alternate layers of quartz and mica, often very argillaceous, and thus passing into *clay-slate*. When talc or chlorite takes the place of mica, the rock is known as *talcose-S.* or *chloritic-S.* In *hornblende-S.* there is little or no quartz present, but often a considerable admixture of felspar.

Schlag'intweit is the name of three brothers, **Hermann von** (born 1826), **Adolph** (born 1829), and **Robert von** (born 1837), sons of Joseph S., a celebrated oculist of Munich, who have distinguished themselves by their devotion to physical science, and especially by their important contributions to the science of geology. The results of their early researches in Switzerland attracted general attention when given to the world in *Untersuchungen über die Physikalische Geographie und die Geologie der Alpen* (Leips. 1854). Aided by the King of Prussia and the E. India Company, they made an important comprehensive survey of the Indian peninsula, the Himalayas, Thibet, Assam, Ladak, and Cashmere (1854-57), an account of which they published under the title *Results of a Scientific Mission to India and High Asia*, with an atlas of views and maps (4 vols. 1860-77, to be completed in 9 vols.). Independently of this work, Hermann issued *Reisen in Indien und Hochasien* (4 vols. 1869). In tracing the sources of the Sutlej and Ganges the brothers crossed the Ibi Gamin, a pass 22,260 feet high, never previously reached by Europeans. Hermann and Robert returned safely to Europe in 1857, and were ennobled by the King of Bavaria in 1859. Adolph, who remained to complete the Himalayan maps with some geological and magnetic details, was prevented from returning through Bengal by the turbulent state of the Sipahi, and while attempting to find his way back to Europe through Chinese Turkestan and Siberia, was murdered at Kashgar, 26th August, 1857. Robert, elected professor of

geography at Giessen, has also made extensive travels in America, the fruits of which are *Die Pacific Eisenbahn in Nordamerika* (1870), *Californien, Land und Leute* (1871), and *Die Mormonen oder die Heiligen vom jüngsten Tage* (1874). —**Edward S.**, a brother of the preceding, was born in 1831, entered the Bavarian army, and fell fighting against the Prussians at Kissingen, 9th July, 1866. —**Emil S.**, a fifth brother, born 1835, studied law at Berlin, and later became an ardent student of oriental languages and history. He is the author of *Buddhism in Thibet* (Leip. 1863), *Die Könige von Tibet* (Munch. 1866), *Die Gottesurtheile der Indier* (1866).

Schlang'enbad, so called from the number of small harmless snakes in its neighbourhood, a celebrated watering-place in the Prussian district of Wiesbaden, 6 miles W. of Wiesbaden, and 5 miles S. of Schwalbach, in a deep valley 950 feet above the level of the sea. It has eight alkaline springs of a temperature of from 79° to 80° F., which are in great repute for beautifying the skin and allaying nervous disorders. The village is very small, but in the season there are generally from 1500 to 2000 visitors, principally females.

Schlegel, August Wilhelm von, a German poet, literary historian, and dramatic critic, was born at Hannover, September 8th, 1767. He belonged to a family many of whose members were connected with literature, though he and his brother (mentioned below) are the only two who require special notice. As a child he was carefully trained by his mother. His public education was carried on at the Hannover Gymnasium, and at the University of Göttingen, where he studied theology and philology. After leaving Göttingen he acted for three years as tutor in Amsterdam and then removed to Jena, where he was appointed professor (1798), and honoured with the title of councillor (1800). Here he began his translation from Shakespeare (9 vols. Berl. 1797-1810, afterwards completed by Tieck; new ed. by Ulrich, 12 vols. 1867, *et seq.*), a work of the very highest merit. As professor he delivered lectures on æsthetics, and along with his brother edited the *Athenæum* (3 vols. Berl. 1796-1800), a critical journal of considerable influence on German literature. He also wrote at Jena his *Ehrenpforte für den Theaterpräsidenten von Kotzebue* (a satirical reply to the *Hyperboreischer Esel* of that author), and a volume of poems (1800), and *Charakteristiken und Kritiken* (2 vols. 1801). In 1802 he delivered at Berlin, in which city he then resided, lectures on the *Literatur Kunst, und Geist des Zeitalters* (published in his brother's magazine, the *Europa*), and in 1803 he published *Ion*, a classical drama of little merit. He followed this by his *Spanisches Theater* (2 vols. Berl. 1803-9; new ed. 1845), and his *Blumensträuße der Ital., Span., und Portugiesischen Poesie* (Berl. 1804). Both volumes consist of faithful and excellent translations. In 1803 he became acquainted with Madame de Staël (whose famous work on Germany was directly 'inspired' by him), and remained the constant friend and companion of that lady till her death in 1819. During this time his chief work was his *Vorlesungen über Dramatische Kunst und Literatur*, delivered at Vienna in 1808, and published at Heidelberg (1809-11). His dissertation on the *Nibelungen Lied*, and two other volumes of poems (Heidelb. 1811; 2d ed. 1820), also belong to this period. In 1819 he accepted the offer of a professor's chair at the University of Bonn, where he applied himself with great zeal to Oriental subjects. This resulted in the publication of his *Indische Bibliothek* (3 vols. Bonn, 1820-30), editions of the Indian classics, the *Bhagavad-Gita* (1823), the *Rāmājana* (Bonn, 1829-39), and *Reflexions sur l'Étude des Langues Asiatiques* (Berl. 1832; dedicated to Sir James Mackintosh). He died at Bonn, May 12, 1845, leaving behind him 126 printed works and many writings in manuscript. S. is best known in German literature as one of the founders of the 'Romantic School,' a body of writers who aimed at reviving the modes of thought and feeling prevalent in the Middle Ages, and especially during the Hohenstaufen period of German history. S. helped forward the work mainly by criticism, for, though a man of vast learning, he was not an original creative genius. An excellent translator, he transferred so accurately the thought and even melody of many great poets from foreign languages to his own, that the spirit of the original was almost fully preserved. His critical tendencies led him to depreciate the French classical school and to value Shakespeare very highly. Indeed, he may be said to have been the first writer who instituted that unmeasured worship which the later German writers have paid to the great drama.

tist. S.'s chief work, *Vorlesungen über Dramatische Literatur*, has been translated into English by Black (Bonn, Lond. 1846). His *Sämmtliche Werke* appeared in 12 vols. (Leip. 1846-47), his *Œuvres, écrites en Française* in 3 vols (1846), and his *Opuscula Latina* (Leip. 1848).—Karl Wilhelm Friedrich von S., brother of the preceding, was born at Hannover, March 10, 1772. He was at first intended for a business life, but soon left commerce to study philology at Göttingen and Berlin, and to devote himself to learning and literature. His first work of importance, *Die Griechen und Römer* (Hamb. 1797), was followed by his *Geschichte der Poesie der Griechen und Römer* (Berl. 1798). He assisted Schleiermacher in the first volumes of his translation of Plato, was then joined with his brother in the editorship of the *Athenæum*, and in 1799 scandalised the German public by the publication of *Lucinde*, a romance directed against the institution of marriage. He did not complete the work, and his next publication was the tragedy of *Alarcos* (Berl. 1802). Subsequently he resided for several years in Paris, where he studied Sanskrit and the art and literature of Southern Europe, lectured on philosophy, and edited the *Europa* (2 vols. Frankf. 1803-5). To this period belong his *Sprache und Weisheit der Indier* (Heidelb. 1808), *Sammlung Romantischer Dichtungen des Mittelalters* (2 vols. Par. 1804), the romance *Lothar und Maller* (Berl. 1805), and a vol. of *Gedichte* (Berl. 1809). On his return to Germany he devoted himself to the study of the history, literature, and architecture of the Middle Ages, and this resulted in his secession to the Roman Catholic Church. His *Vorlesungen über die neuere Geschichte* (Vien. 1811) and *Geschichte der alten und neuern Literatur* (Vien. 1815) contain his views in favour of his adopted creed. His later works were the well-known *Philosophie des Lebens* (Vien. 1828) and *Philosophie der Geschichte* (Vien. 1829). He died at Dresden, June 12, 1829. As a writer his tendencies lie in the same direction as those of his brother, but they were more pronounced. He possessed a share of original genius, and his writings show that he was a man of an ardent and enthusiastic spirit, ready to follow what he believed to be the truth wherever it might lead him; but he was wanting in that which was his brother's chief excellence, the judicial calmness and breadth of view which are so essential to the true critic. His poems are marked by strong patriotic feeling. His *Sämmtliche Werke* appeared in 10 vols. (Vien. 1830; 2d ed. 15 vols. 1846).

Schleiermacher, Friedrich Daniel Ernst, the greatest German theologian of the 19th c., was born at Breslau, Nov. 21, 1768. After studying under the Moravian Brethren at Niesky (from 1783) and Barby (from 1785), he entered the University of Halle (1787), and sat at the feet of Semler and Eberhard. From this date till his appointment as 'Charité-prediger' at Berlin (1796) has been called his 'critico-rationalistic period.' After this he zealously applied himself to pastoral work and the study of Kant, Fichte, Schelling, and 'the holy outcast' Spinoza, and ere long he was drawn into the circle of a new school. He entered with ardour into the literary life of Berlin, associating chiefly with G. von Brinkmann, Scharnhorst, Alexander von Dohna, Henriette Herz, Dorothea Veit, and especially Friedrich von Schlegel, whose 'romantic' principles he embraced with enthusiasm. His first work, *Über die Religion: Reden an die Gebildeten unter ihrer Verachtung* (Berl. 1799; new ed. 1868), which with inspired eloquence maintained that true religion can never come into collision with human culture, if each be but kept to its own scope, was received in Romantic circles as the gospel of the new century. Yet it struck a deeper chord than any of the Romantic leaders save Novalis knew. His *Monologen, eine Neu-jahrs-gabe, dargebracht dem neuen Jahrhundert* (1800; new ed. 1871), asserting the dominion of personality and will over the world and fate, are the complement of the *Reden*. From 1802 he was court-preacher at Stolpe, where he wrote *Grundlinien einer Kritik der bisherigen Sittenlehre* (Berl. 1803, ended 1834), and in 1804 he was appointed professor and university preacher at Halle, where he wrote the dialogue *Die Weihnachtsfeier* (Halle, 1806; 6th ed. Berl. 1869), a representation of different conceptions of the person and work of Christ. Driven to Berlin in 1807, he busied himself with his translation of Plato (already begun with F. Schlegel in 1804; 5 vols. Berl. 1804-10; 2d ed. *ib.* 6 vols. 1817-28), and was appointed (1808) preacher at the

Trinity Church, and (1810) professor at the University. About this time ended the 'Romantic period' in S.'s career, and what is called his 'period of positive theology' began. To this period belongs his greatest work, *Der Christliche Glaube, nach den Grundsätzen der Evangelischen Kirche in Zusammenhange dargestellt* (2 vols. Berl. 1821-22; 5th ed. 1861). He refers religion to the 'consciousness of the most absolute dependence upon God, whom thought cannot conceive, and the will cannot approach,' maintaining against Pietism the right of free inquiry, and against Rationalism the inestimable importance of the person of Christ, in whom dependence on, and reconciliation with God, had its highest historical realisation. The opposition of the ecclesiastical theologians to S. was chiefly due to their judging his conception of God as tending to Pantheism. S. died at Berlin, February 12, 1834. A complete edition of his works appeared at Berlin (1836-56; I. *Zur Theologie*, 13 vols.; II. *Predigten*, 10 vols.; III. *Zur Philosophie*, 10 vols.), and a popular edition of the *Predigten über den Christlichen Hausstand* (*ib.* 1872-76). His *Pädagogische Schriften* were separately published by C. Platz (Langensalza, 1872; 2d ed. 1876). See S.'s *Selbstbiographie bis April 1794* (vol. i. of his *Gesammelte Werke*); Jonas and Diltthey, *Aus S.'s Leben: In Briefen* (4 vols. Berl. 1858-63); W. Gass, *Briefwechsel mit J. Chr. Gass* (*ib.* 1852); Auberlen, S.: *Ein Charakterbild* (Basel, 1859); Elisa Maier, F. S.: *Lichtstrahlen aus seinen Briefen und Sämmtlichen Werken* (Leip. 1863); Schenkel, F. S., *Ein Lebens- und Charakterbild* (Elberfeld, 1868); Diltthey, *Leben S.'s* (Berl. 1870 *et seq.*).

Schlesien (Silesia), a former duchy of the crown of Bohemia, divided since 1742 into Prussian and Austrian S. In 1537 an agreement (*Erbverbrüderung*) was made between the Duke of Liegnitz, one of the princes of Silesia, and the Elector of Brandenburg, that if either of the reigning families should become extinct, its possessions should fall to the other. The line of Liegnitz died out in 1675, but the Emperor of Germany refused to acknowledge the validity of the contract of 1537, and joined that part of S. which belonged to the line of Liegnitz to Austria as a lapsed fief of Bohemia. In 1740, Friedrich the Great, reviving the claim of Brandenburg, marched into S. without declaring war, and seized the greater part, joining it to Prussia in 1742. It was finally ceded by Austria in 1763, after the First and Second Silesian Wars (1740-42, 1744-45), and the Seven Years' War (1756-63). The part remaining to Austria was included in Moravia until 1849, when it became a separate crown-land of Austria. (1) **Preussisch-S.**, one of the richest provinces of Prussia, is surrounded N. by Posen, E. by Poland, S. by Austrian S., Moravia, and Bohemia, and W. by Saxony and Brandenburg. Area, 15,666 sq. miles; pop. (1875) 3,863,699. It is of elliptic shape, 250 miles long by 100 broad, and is the highest table-land of Germany, 'spread on the top of Europe, and sending rivers into all the seas.' Of the surface nearly one-seventh is occupied by mountains, three-sevenths are hilly or undulating, and three-sevenths level and fertile plain-land. It is highest in the S. and S.W., where it is separated from Bohemia by the Riesengebirge (q. v.), which extend in continuation of the Erzgebirge and Lausitzgebirge, and from which the surface slopes to the E. and N. From the Bohemian side of these mountains flow the Elbe and Morava; from the Silesian, the Oder and Vistula. S. is traversed by the Oder from S.E. to N.W., and is abundantly watered by the main stream and its affluents, the Glatzer-Neisse, Bober, Malapane, Bartsch, and Lausitzer-Neisse. Forests, principally of pine, from which timber and tar are produced, cover 3680 sq. miles. The principal crops are corn, flax, and hemp. Beetroot, sugar, madder, and tobacco are also raised and largely exported. In the region of Ober-S. are valuable mines of iron, lead, copper, zinc, and coal. In 1872 were produced 9,204,084 tons of coal, 400,670 tons of lignite, and 31,215 tons of iron ore; and in 1877 the iron-works of S. employed 10,294 men, the foundries 2331. The W. part, on the extensive spurs of the Riesengebirge, is one of the most important industrial districts of Prussia; manufactures of cottons, woollens, linens, paper, leather, and damasks, are actively carried on, facilitated by the great water-power. In 1872 S. had 1160 miles of railway. S. is divided into three districts—Breslau, Oppeln, and Liegnitz. Its inhabitants are intelligent, and education is in an advanced state. In the summer of 1877 S. had 35 Gymnasien, with 10,800 pupils, and 524 teachers; 9 Real-

schulen of the first rank with 2771 pupils and 148 teachers; while in the 7 higher Bürgerschulen were 1601 pupils and 826 teachers. Breslau, the capital, has a university.—(2) **Oesterreichisch-S.**, a crownland of Austria, consisting of two portions separated by a part of Moravia, and extending from N.E. to S.W. for 100 miles, with a breadth of 40 to 14 miles, is bounded N. and W. by Prussian S., E. by Galicia, S. by Hungary and Moravia. Area 1987 sq. miles; pop. (1869) 513,352 (all Roman Catholics except 74,220 Protestants and 6142 Jews). The surface is mountainous. In the N.W. extend the Sudeten, with transverse spurs, and in the S.E. the Bieskiden. S. is watered by the upper courses of the Oder and Vistula, and by the Oppa, Mohra, Ostravitz, Olsa, and Bi-ala. Of the soil 47 per cent. is arable, 7'5 in meadow and garden, 10'5 pasture, 31 under wood, and 4 waste land. Corn, flax, rye, and barley are raised, and there is extensive sheep and cattle rearing. S. has rich mines of coal and iron. In 1876 it produced 81,062 metric cwt. of iron ore, 10,433 metric cwt. of lignite, and 12,464,316 metric cwt. of coal. The chief industries are the manufacture of cottons, woollens, linens, damasks, leather, hardware, beet-sugar, and alcohol. S. has three Gymnasien. The largest towns are Troppau (the capital), Bielitz, Teschen, and Jägerndorf. See Grunhagen, *Schles. Geschichte* (2 vols. Berl. 1857).

Schlettstadt (Fr. *Schlestadt*), a town of Germany in Lower Elsass, 23 miles S. of Strassburg, and 60 N. of Basel by rail, has two fine Catholic cathedrals, one dating from the 11th c., the other from the 13th c. It is a busy industrial town, with woollen, cotton, linen, furniture, soap, oil, and shoe manufactures; also breweries, tanneries, sawmills, &c. S. was ceded to France in 1648 by the Peace of Westphalia. A fortified town, it was besieged by the Germans in the Franco-Prussian war, and surrendered on the 24th October, 1870. Pop. (1875) 9088.

Schles'wig. See SLESVIG.

Schloss'er, Friedrich Christoph, a German historian, born at Jever in Oldenburg 17th November 1776, was educated at Göttingen, and was for some time a private tutor, a schoolmaster, and town librarian at Frankfurt. In 1817 he became professor of history at Heidelberg, a post which he held for 44 years. He died 23d September 1861. His principal works are his *Weltgeschichte in zusammenhängender Erzählung* (9 vols. Frankf. 1817-24; 2d ed. 1839-41), his *Geschichte des 18. Jahrh.* (2 vols. Heidelb. 1823; 4th ed. 8 vols. 1853-60), and his *Weltgeschichte für das Deutsche Volk* (19 vols. Frankf. 1842-54; new ed. brought down to 1871 by Jäger and Greiznach, 18 vols., Oberhausen 1870-74). See *Nekrolog S.'s* (Leip. 1861) by Prof. Servinus, one of his disciples in historical science, and Weber's *Erinnerungsblätter aus S.'s Leben und Werken* (Leip. 1877).

Schmalkald, League of, was the alliance formed at Schmalkald, 22-31 December 1530, by Johann, Elector of Sachsen, Philipp of Hessen, Philipp and Franz of Braunschweig, Ernst of Lüneburg, Wolfgang of Anhalt, Gebhardt and Albrecht of Mansfeld, and a deputy from Georg of Brandenburg, along with the cities of Strassburg, Ulm, Constance, Reutlingen, Memmingen, Lindau, Biberach, Isny, Lübeck, Magdeburg, and Bremen; to which Brunswick, Göttingen, Goslar, and Eimbeck soon afterwards adhered. Their object was to resist Karl V.'s threatened action against the Protestant party. They met again March 29-April 4, 1531, and renewed the league for six years. The Elector of Sachsen and Philipp of Hessen were appointed commanders-in-chief; military and financial departments were organised; and troops were hired. A threatened alliance with France, though opposed by Luther, had the effect of making Karl sign (1532) the treaty of Nürnberg, by which he agreed to tolerate the Protestant faith. But the League was not dissolved. It was indeed renewed for ten years in 1535, when a new confession was adopted. Würtemberg, Pommern, Frankfurt, Augsburg, Hannover, Hamburg, and the princes of Anhalt, joined during 1536. In June 1538 the Catholic princes formed a counter league at Nürnberg, and only the Turkish invasion delayed an open outbreak. Karl himself now engaged in war with France, leaving the leaguers to be opposed by the Grand Duke Heinrich of Braunschweig, whom they defeated and made prisoner. The League having firmly refused (1545) to attend the council of Trent, the King of Denmark and several other princes and cities left it. The Emperor also con-

trived to gain over Duke Moritz, and on the 20th July 1546 put Johann Friedrich of Sachsen and Philipp of Hessen under the ban of the empire. Meanwhile the S. war had begun. Though at first successful, the Leaguers, acting too much on the defensive, were driven out of S. Germany. Then Friedrich, after several defeats, was made prisoner at Mühlberg, 24th April 1547. In June of the same year Philipp of Hessen was also captured, and the S. L. was finally broken up. See Ranke, *Deutsche Geschichte im Zeitalter der Reformation* (vols. iii. and iv.); Maurenbrecher, *Karl V. und die Deutschen Protestanten, 1545-55* (Düsseld. 1865); and G. Voigt, *Moritz von Sachsen* (Leip. 1876).

Schmalkald'en, an old town of Germany in the province of Hessen-Nassau, on the Schmalkalde, 30 miles S. of Eisenach, and 60 N. of Koburg by rail. It has a Gothic church (15th c.), the massive Wilhelmsburg (1584), and an old inn, the Krone, at which the S. League (q. v.) was signed. The chief industry is the production of hardware goods. Pop. (1875) 6187.

Schmerling, Anton, Ritter von, an Austrian statesman, was born at Vienna, 23d August 1805. After a complete study of law he entered the service of the state in 1829, and was in 1846 appointed 'Appellationsrath' at Vienna. A prominent opponent of the policy of Metternich, S. was sent to Frankfurt in April 1848 as Austrian agent, became president of the 'Bundestag' (19th May), and from the 15th July to the 15th December was foreign minister under the 'Reichsverweser.' After this he was appointed Austrian plenipotentiary at Frankfurt, and continued to be the parliamentary leader of the 'Great German Party,' till, finding his efforts unavailing, he withdrew in April 1849 and returned to Vienna. From July of the latter year S. was Austrian Minister of Justice, but in January 1851 he resigned office, being unwilling to accept a reactionary policy, and became President of the Senate. On the 13th December 1860 he was re-appointed minister, to direct the changes consequent on the 'diploma' of the 20th October. The constitution of February 1861 was mainly his work. Failing, however, to establish the complete constitutional unity he aimed at, S. resigned on the 27th July 1865, and became first president of the supreme court at Vienna. In 1867 he was appointed life member of the Upper House, of which since 1871 he has been president.

Schmidt, Karl, a German educationist, was born 7th July 1819. He studied at Berlin and Halle, and in 1846 became teacher in the gymnasium of Kothen, whence in 1863 he was transferred to the directorate of the teachers' seminary at Gotha. He died 8th November 1864. His chief works are *Gymnasialpädagogik* (1857), *Geschichte der Erziehung und des Unterrichts* (1860), *Geschichte der Pädagogik* (1862, rev. ed. 1872), *Zur Reform der Lehrer-Seminare und der Volksschule* (1863), *Das Buch der Erziehung* (1864), *Zur Erziehung und Religion* (1865), and *Anthropologie* (1865).

Schmitz, Leonhard, an industrious philologist, was born at Eupen, near Aachen, in 1807, studied at Bonn under Niebuhr and Welcker, and after some experience in teaching went to England. He was rector of the Edinburgh High School from 1845 to 1866, when he became principal of the London International College—a post which he held till 1874, when he was appointed classical examiner to London University. He has translated Niebuhr's Lectures (8 vols. 1844-53), and Zumpt's *Latin Grammar*, edited the *Classical Museum* (1844-50), contributed to Smith's Classical Dictionaries and to the *Encyclopædia Britannica*, and written several school histories. His latest work is a Latin Grammar (Glasg. Collins, 1877).

Schnee'berg, a town of Saxony, on the Mulde, a tributary of the Elbe, 20 miles S.E. of Zwickau by rail. It has a Protestant cathedral (the largest in Saxony) of the 16th c., in the later Gothic style, 235 feet long and 109 broad, with a tower 262 feet high, which contains a very large bell. S. formerly had important silver mines, and enjoyed the right of coining its own money from 1492 to 1556. The silver is now exhausted, but cobalt is still worked. S. has also manufactures of chemicals and of aromatic snuffs. Pop. (1875) 8074.

Schnee'koppe (Ger. 'Snow Top'), or **Biesen Koppe** ('Giant Top'), the culminating point of the Riesengebirge, and

the highest summit in Central Germany, is 5275 feet in height. The top, an extensive plateau, is occupied by a chapel, erected in 1681, and two hotels.

Schnei'der, Eugène, a distinguished French manufacturer and politician, born at Nancy in April 1805. His parents were poor, and S. betook himself to business at an early age. In 1830 he was entrusted with the management of the Bazelles foundries, and some years later, along with his elder brother, became manager of the engineering works at Creuzot. Under S. these works ultimately attained a vast expansion, employing not fewer than 12,000 hands, and producing most of the government arms, and of the locomotives and steam-engines in use on the French railways. S. entered political life in 1845, was elected in 1852 a Bonapartist candidate to the Chamber of Deputies, of which he became one of the vice-presidents. From 1867 to 1870 he was regularly named president by the Emperor at the opening of each session, and discharged his difficult duties with energy and tact. S. died November 30, 1875. A monument erected to him at Creuzot was subscribed for by 25,000 persons, and unveiled in January 1876.

Schnei'der, Hortense Catherine, a French actress, born at Bordeaux about 1835, played at the age of fifteen in *Michel et Christine* at the Athénée of her native city. In 1856 she made a successful debut at Paris in *Le Chien de Garde* at the Théâtre des Variétés. Her popularity was increased by her performances at the Théâtre du Palais Royal after 1858, and finally she excited a furore by her acting in *La Belle Hélène* (1864) and *La Grande Duchesse de Gérolstein* (1867). In 1868 Mme. S. appeared on the London stage and was immensely popular. In 1869 she rejoined the Opera-Bouffe Company at Paris. Mme. S. is lavish in histrionic allurements, and sings and dances with more than Parisian freedom.

Schöff'er, Peter, born at Gernsheim, near Darmstadt, between 1420 and 1430, studied at the University of Paris, where he was a copyist in 1449. In 1450 he removed to Mainz, where he became the son-in-law of Johann Faust (q. v.). According to a passage in Trithem's *Chronicon Monasterii Hirsaugensis* (2d ed., 2 vols. St. Gall. 1690) written on the authority of S.'s grandson, S. 'perfected the art of printing, by devising an easier mode of casting types.' This is generally believed to have been the invention of the punch and matrix, in which, Lambinet says, 'is the essence of the art of Printing.' S. died in 1502. In 1836 a monument was erected to him at Gernsheim. See A. Bernard, *Histoire de l'Imprimerie en Europe*.

Scho'field, John M., an American soldier of distinction, was born in Chautauqua county, New York, September 29, 1831. He was educated at the West Point Military Academy, in which he was professor of natural philosophy from 1855 to 1860. At the outbreak of the Civil War he held a similar position in the Washington University, St. Louis. As major-general of volunteers and afterwards brigadier-general in the regular army, he served under Sherman in his Georgian campaign, and under Thomas in Tennessee. In 1865 he held an independent command in N. Carolina, where he gained the battle of Kinston. He was Secretary for War in 1868-69, when he was promoted to be major-general. After holding military commands in Missouri and on the Pacific coast, he became superintendent of the West Point Military Academy in 1876.

Scho'larships, in the schools and universities of England, are benefactions for the support of students, corresponding to a Scotch Bursary (q. v.). Originally founded for the most part with special restrictions as to place of birth or education, or as to kinship with the founder, the S. at Oxford and Cambridge are now almost all thrown open to competition. See OXFORD and PUBLIC SCHOOLS.

Scholas'tics. See SCHOOLMEN.

Schom'burgk, Sir Robert Hermann, was born at Freiburg-an-der-Unstrut, Prussia, June 5, 1804, and began life as a merchant at Leipzig in 1823, whence he went to Virginia, and was engaged for some time unsuccessfully in a tobacco-manufacture. In 1829 he went to St. Thomas in the W. Indies. Having by himself acquired a knowledge of all the natural sciences and some skill in the use of nautical instruments, he devoted his

energies to discovery. A report on the island of Anegada brought him under the notice of the Geographical Society, and in 1835 they charged him with the examination of British Guiana. At various intervals he sent home reports of his progress, and in 1837 discovered at Berbice the great water-lily *Victoria regia*. On his return to England in 1839 he received the gold medal of the Geographical Society, and published his *Travels in British Guiana*. He surveyed the frontier of British Guiana and Brazil (1841-44), and returning was knighted in 1845. S.'s other works are *The Fishes of Guiana* (2 vols. 1841-43), *History of Barbadoes* (1847), and *The Discovery of Guiana by Sir Walter Raleigh* (1848). In 1848 he went out to San Domingo as British consul, whence he passed in 1857 to Bangkok in Siam. Returning to Europe in 1864, he died at Schöneberg, near Berlin, 11th March 1865.

Schön'bein, Christian Friedrich, a German chemist, was born at Metzingen in Württemberg, October 18, 1799. He studied at Jütsingen and Erlangen, and in France and England. In 1828 he was elected professor of chemistry at Basel, where subsequently he became a member of the Great Council. The most important of his contributions to chemistry are the discovery of ozone (1839), of gun-cotton (1845), and of collodion (1845). He died near Baden-Baden, August 29, 1868. The results of his researches are given partly in scientific journals, and partly in separate treatises. Of these may be mentioned *Das Verhalten des Eisens zum Feuerstoff* (1837), *Beiträge zur Physikalischen Chemie* (1844), *Ueber die Erzeugung des Ozons* (1844), *Ueber die langsame und rasche Verbrennung der Körper in atmosphärische Luft* (1845). His Life has been written by Hagenbach (1869).

Schön'brunn, a palace of the Austrian emperors, to the S.W. of Vienna, and beyond the right bank of the Wien; was built by the Emperor Matthias and occupied by Napoleon I. in 1804 and 1809. It has splendid gardens containing much fine statuary, a botanical garden, and a menagerie, and is named from the *Schöne Brunnen* ('beautiful fountains'), one of the chief attractions in the gardens.

Schön'ebeck, a town of Prussian Saxony, on the Elbe, 9½ miles S. of Magdeburg by rail, is an important salt-mining centre, producing about 70,000 tons of salt per annum. The bore of one of the mines, 1561 feet deep, goes through 557 feet of rock-salt. S. has also chemical works which produce annually more than 7000 tons of muriatic acid, 5600 tons of sulphuric acid, also nitric acid, gunpowder, &c. There are sulphur baths, extensive breweries, some shipbuilding, and in the neighbourhood great bleaching works. Pop. (1875) 10,979.

School-Boards. See PUBLIC SCHOOL SYSTEM OF THE UNITED KINGDOM.

School'craft, Henry Rowe, LL.D., an American geologist and ethnologist, born at Watervliet (now Guelderland), in New York, 28th March 1793. He was educated at Union and Middleburg colleges, and after a journey in Missouri and Arkansas he published *A View of the Lead Mines of Missouri* (New York, 1819). He was appointed geologist to an exploring expedition to the Upper Mississippi and Lake Superior, and published a *Journal* of the expedition in 1821. In the same year he went to Chicago to act as secretary to a conference of Indian chiefs, and henceforward he devoted himself greatly to Indian ethnology, holding several Government appointments which brought him into connection with the native tribes. In 1823 he married a lady of Indian descent, and in 1836 he negotiated a treaty by which the United States government bought from the Chippewa Indians a tract of territory on the Upper Lakes 16,000,000 acres in extent. In 1842 he visited Europe. By the appointment of the Government he edited a series of reports on all the Indian tribes of the United States, published in six volumes at Philadelphia (1851-57). During the latter years of his life he was disabled by paralysis. S. died at Washington, December 10, 1864. His other works are *A Narrative of an Expedition to Itasca Lake* (1834); *Onota, or Characteristics of the Red Race in America* (1844); *Personal Memoirs of a Residence of Thirty Years with the Indian Tribes* (1851), and numerous treatises, novels, and poems. S. was a member of many literary and scientific societies in Europe as well as America.

School'men, The, is the name applied to a number of theological writers and philosophers who flourished during the later portions of the Middle Ages—from the eleventh century to the Reformation. Though differing widely from each other in many points, they all agreed in the following particulars: (1) They assumed as a starting-point that the creed of the Church with related dogmas was absolutely true. (2) They were all students of Aristotle as far as his writings were known to them. (3) They took as their special work the reconciliation of the dogmas of the Church with reason. Among the chief points of difference may be mentioned: (1) the question whether the understanding (*intellectus*) or will (*voluntas*) was the supreme principle (Aquinas holding the former opinion, Duns Scotus the latter); and (2) the celebrated controversy as to Nominalism and Realism. (See NOMINALISM.) The Nominalists held that individual objects alone existed, thus the name 'man' merely expressed the fact that there were a number of individual men; but the Realists held that there was a 'universal' or actual objective general idea of man from which as pattern all individuals were formed. The one considered universals to be mere names; the other held them to be the truest existence—they were, as they expressed it, *universalia ante res*. An intermediate theory was propounded by Abelard, and this, under the name of Conceptualism, has been received into modern philosophy. General notions have an existence, but only in the mind, for by a process of thought they are abstracted from individuals by considering the properties in which these agree. Many of the S. were men of genius, and their works exhibit great though perverted ingenuity. Their speculations have, however, little value for modern thought, and the neglect to which they have been condemned is justified by the fact that all their inquiries proceeded on suppositions which philosophy has for centuries refused to acknowledge as well founded. The principal S. were Roscellinus (the founder of Nominalism), Anselm of Canterbury (his great opponent), and Abelard. These belong to the early period of scholasticism. Later were Alexander of Hales, Bonaventura, Albertus Magnus, Thomas Aquinas, Duns Scotus, and William of Occam. See Hauréau, *De la Philosophie Scolastique* (2 vols. Par. 1850); W. Kaulich, *Geschichte der Scholast. Philosophie* (Prag. 1853), and Bishop Hampden, *The Scholastic Philosophy in its Relation to Christian Theology* (3d ed. Lond. 1838).

Schools, Christian and Charitable, were founded at Paris in the end of the 17th c. by Nicholas Barre (born at Amiens, 1621). Having devoted himself to the task of gathering street Arabs in order to educate them and train them to a Christian life, he got a number of ladies to assist him in 1678. This scheme having met with success, he got a number of male assistants in 1681. This was the foundation of one of the most flourishing lay orders in the Roman Catholic Church—the Brothers and Sisters of the C. and C. S. of the Holy Infant Jesus. The work of the order is the secular and religious education of the poor, the instruction given being entirely gratuitous. See Helyot's *Hist. des Ordres Chret.* (Par. 1714-19); Wetzler, *Kirchenlexikon* (Freib. 1854-60), and K. A. Schmidt, *Encyklopädie des gesammten Erziehungs- und Unterrichtswesens* (10 vols. Stuttg. 1859-75).

Schools, Public. See PUBLIC SCHOOLS and PUBLIC SCHOOL SYSTEM OF THE UNITED KINGDOM.

Schools of Design and Schools of Art. The first school of design in this country was established in the year 1837 for the purpose of supplying a remedy for the alleged artistic inferiority in British manufactures to those of continental countries. In accordance with the recommendation of a select committee of the House of Commons, a central institution was established at Somerset House, and a limited number of provincial schools were subsequently founded in the leading manufacturing towns. In 1852 the cost to government of the central school was £3474, and of 17 provincial schools, £6850. In this year was constituted the Department of Practical Art, which was merged in the Department of Science and Art in 1853. The central institution was removed to South Kensington, and the Department from this centre organised an elaborate and complete system of instruction in all branches of art connected with manufactures, encouraged teachers to qualify by granting them certificates on their passing certain stages and attaching thereto a money value,

and offered medals, scholarships, and prizes to students, for whose education grants of from 5s. to 30s. were made. In return the schools were required to make provision for the admission of artisans to classes on low terms, and to supply elementary instruction in drawing to children. In 1862 it was determined that payments by results should wholly regulate the allowances to S. of A. The operations of the Department have produced most gratifying results, and the evidence of leading manufacturers, taken before various committees of the House of Commons, bears witness to a great improvement in taste and elegance of design in native productions.

The objects of the grants voted by Parliament and administered by the Science and Art Department of the Committee of the Council on Education are, 'to promote instruction in drawing, painting, modelling, and designing for architecture, manufactures, and decoration, especially among the industrial classes.' A school of art is defined as a 'room or rooms devoted wholly to instruction in art, where examples of art are always accessible for study and inspection, and where instruction is given by a teacher holding an art teacher's certificate or certificates of the third grade.' The principal subjects of study and examination in S. of A. are painting from still life, anatomy, advanced perspective, architecture, design, drawing from the antique, drawing from life, ornamental modelling, modelling from the antique, and modelling from life. Sums from 10s. to £15 per head are given to these institutions according to the qualifications of successful students, the best works being sent up annually for examination at South Kensington, and entering into national competition. Sums varying from £50 to £10 are awarded to the head teachers of the sixty S. of A. in which the amount of work as tested by results is generally most satisfactory. Building grants not exceeding 2s. 6d. per superficial foot of internal area, to a maximum of 4000 feet, are made to projected S. of A. approved by the Committee of Council, and grants of 75 per cent. are made towards the purchase of approved art examples. In training schools 10s. is paid to the authorities for each exercise of the second grade successfully worked by a resident student in subjects in which he has not previously passed. Aid to art classes (for instruction in elementary drawing) is made from 10s. to 20s. per head for students who acquire themselves creditably in the annual examinations. Students must pay (except in special circumstances) at least 3s. 6d. for each sessional course of instruction in art. The department encourages drawing in elementary day-schools at which children are instructed by teachers holding art certificates of the second or third grade, the payments varying from 1s. to 5s. per child, according to results at the annual examinations. The National Art Training School at South Kensington is established for the purpose of training art masters and mistresses for the United Kingdom for the instruction of students. Its course comprises twenty-three stages of instruction, divided into the six groups of elementary drawing and colouring, painting, figure, modelling ornament, modelling figure, and technical instruction, these forming the subjects of third-grade certificates. The prizes awarded in the national competition consist of gold, silver, and bronze medals, books, the Princess of Wales' scholarships awarded to the two most successful female students of the year, and several money prizes given by various firms and companies for specified subjects of design, besides the Owen Jones Memorial prizes given by the Society of Arts. The works exhibited at the national competition in 1878 numbered about 1400, selected from 138,045 works sent out from 142 S. of A.

According to the twenty-fifth Report of the Science and Art Department, published in August 1878, the total number of S. of A. in operation throughout the kingdom in 1877 was 144, with 29,414 students who paid £35,346 in fees. There were 910 art classes with 29,579 students, and 3767 elementary schools where 549,010 children (of whom 403,208 were examined in March 1877) were taught drawing. The total number of persons taught drawing, painting, and modelling through the agency of the department was

In 1875	449,689
" 1876	530,412
And " 1877	610,620

In the five years 1873-77, the institutions in which instruction is given in drawing or higher art are nearly doubled, while the total amount given by the department in payment on results rose from £31,918 in 1873 to £49,960 in 1877.

See Report of 1st August 1860 of the Committee of the House of Commons on South Kensington Museum; Report of the Committee of 8th July 1864 on S. of A.; the Annual Reports of the Science and Art Department; and the Science and Art Directories.

Schoon'er, a fast-sailing, sharp-built vessel, usually of small size and with two masts of considerable length and rake. In a 'fore-and-aft S.' both masts are rigged with fore-and-aft sails; in a 'square topsail-rigged S.' the foremast has a square topsail and square topgallant-sail. The first S., said to have been built in Gloucester, Massachusetts, about 1713, was so named from the New England word *scoon*, 'to make ducks and drakes' (comp. Prov. Eng. *scun*, and Scot. *scun*).

Schoopenhauer, Johanna, a German novelist, born at Danzig in July 1770, wrote a large number of novels, of which the chief were *Gabriele* and *Die Tante*, accounts of travel through parts of Europe, and several works on art subjects. Her *Sämmtliche Werke* were published in 24 vols. (Leip. and Frankf. 1830-31). She died at Jena, 18th April 1838. Her novels, which are written in a lively style, show a wide if superficial acquaintance with human life. She will probably be best remembered as the mother of **Arthur S.**, one of the most eminent of modern German philosophers, who was born at Danzig, February 22, 1788. During the early part of his life he was engaged in business pursuits, but on the death of his father he willingly relinquished what was to him an uncongenial occupation, and proceeded in 1809 to the University of Göttingen, where he studied science, history, and philosophy. In 1813 he obtained the degree of doctor from the University of Jena. His thesis, a powerful and original essay, was entitled *Ueber Die vierfache Wurzel des Satzes vom zureichenden Grunde* (Rudolst. 1813; 15th ed. Leip. 1875). In 1819 his great work *Die Welt als Wille und Vorstellung*, appeared in four parts (2 vols. 4th ed. Leip. 1873). After its completion he travelled in Italy, and on his return acted as 'private lecturer' in the University of Berlin. Nobody attended his lectures, and when the cholera appeared in the capital in 1831, S. fled from it in abject terror. He died at Frankfurt-am-Main, September 21, 1860. Besides the works mentioned above, S. wrote *Ueber das Sehen und Die Farben* (Leip. 1816); *Ueber den Willen in der Natur* (1836; 3d ed. 1867); *Ueber die Freiheit des Willens* (1839); *Ueber das Fundament der Moral* (1841). The last two appeared together under the title *Die beiden Grundprobleme der Ethik* (2d ed. Leip. 1860), and two volumes of essays, entitled *Parerga und Paralipomena* (Berlin 1851; 3d ed. 1874). These last consist of a series of brilliant papers on apparitions, death, study, authorship, criticism, and fame, together with bitter attacks on university professors, and a host of caustic and ill-natured maxims. The centre point of S.'s theory is the prominence he gives to will, by which term he means 'not only conscious desire, but also unconscious instinct, and the forces which manifest themselves in inorganic nature.' Thus the world is 'one enormous will constantly rushing into life.' Through all things we see the 'will to live' ever active; all animals are constantly striving to protect their existence against foreign forces, and to perpetuate it. All the gradations through which nature mounts, from low to high, are just so many imperfect states of the objective expression of will. Between the will and the individual object stand the ideas, as that in which the will alone is immediately objective. Imperfectly expressed in numberless individuals, they exist eternally perfect apart from space and time. This continual struggle one against the other, when viewed from a moral standpoint, gives us a theory of Pessimism. Acquaintance with life causes us to relinquish this fruitless struggle—negates the will to live. Thus we have asceticism as a rule of living, and a Buddhist Nirvana, or state of unconsciousness, as the highest possible mental condition. The knowledge, moreover, that our will is part of the universal will, requires us to sympathise with all the unavoidable suffering exhibited in life, for that suffering is caused by the incessant striving and imperfect success of this 'will to live.' As is to be expected from these speculations, S. paints actual life in the blackest possible colours; 'wickedness,' he says, 'has the upper hand, and folly the casting-vote. Life is a business whose profits do not nearly cover its expenses. Everything works for the future, which proves as bankrupt as the present.'

S. was for long a disappointed man. Notwithstanding the

extraordinary merit of his works, and the clear powerful style in which they were written, they fell almost still-born from the press; his lectures were unattended, and he himself was unknown. Fame and pay, he bitterly complained, were reserved for men like Fichte, Schelling, and Hegel. 'These men,' he said, 'ought to be banished from the ranks of philosophers—they were mere charlatans.' 'Nonsense,' he added, 'had culminated in Hegel.' He pretended to be indifferent to the opinion of the world, but indeed he was keenly alive to it, for he was by no means an observer of the practical precepts of his own creed. When at last the tide turned, he could hardly conceal his joy, and the rapid change for the better in his character showed that under other circumstances this philosophical Timon might have been a very different man. Of late years his writings have attracted an ever-increasing circle of readers, and lectures are regularly delivered at the German universities on his philosophy. After all, his estimate of his own merits was the true one, for the world has emphatically decided that the voice of this misanthrope is well worth hearing. Besides the new editions of S.'s separate works, there have appeared *Aus A. S.'s handschriftlich, Nachlass* (Leip. 1864), and his *Sämmtliche Werke* (6 vols. Leip. 1873-74; 2d ed. 1877). S.'s Life has been written by W. Gwinner (2d ed. Brockhaus, Leip. 1878). For a popular and tolerably complete account in English, see *A. S., his Life and Philosophy*, by Helen Zimmern (Lond. 1876).

Schorl Rock, a rock composed of schorl or tourmaline and quartz. It is occasionally associated with mica, felspar, &c., in which circumstances it may be called *schorly granite*.

Schottische (Ger., Fr. *Écossaise*), a popular slow dance in two-four time, Scotch only in name.

Schouw, Joachim Frederik, a famous Danish botanist, was born at Copenhagen, 7th February 1789. In 1808 he commenced the study of law. After a tour in Norway (1812) with the botanist Chr. Smith, he entered the state-service as a chancery clerk in 1813, became Professor of Botany at Copenhagen in 1820, and in 1841 director of the Botanic Garden. He died 28th April 1852. S.'s chief works are *Grundtræk til en almindelig Plantegraphi* (Copenh. 1822; German, Berl. 1823); *Skildring af Veirigtets Tilstand i Danmark* (ib. 1826); *Bidrag til Klimatologi* (ib. 1827); *Europa: Physisk-geografisk Skildring* (ib. 1832; Ger. ib. 1833); *Tableau du climat et de la végétation d'Italie* (vol. 1. ib. 1839); *Natur-Skildringer* (2 parts, ib. 1839-45; Ger. trans. by Zeise, Leip. 1851); *Prover paa en Jordbeskrivelse* (ib. 1851; Ger. trans. by Seebald, Berl. 1851). S. was also an active Liberal politician. He was chosen in 1835 to represent the University in the Assembly of the Estates of Denmark, of which he was president at Roeskilde in 1835 and 1838, and at Viborg in 1836. He was also editor of the *Dansk Ugeskrift* (8 vols. Copenh. 1831-36; continuation, 8 vols. ib. 1842-46), and *Dansk Tidsskrift* (ib. 1847-52).

Schouw'en, an island of the Netherlands, forming part of the province of Zeeland, bounded N. by the S. branch of the Maas, and S. by the Ooster Scheldt. Area, 61½ sq. miles; pop. 16,000. S. produces abundant grain, flax, and madder, and is protected on all sides by dikes. There is considerable trade in salt, sea-fowls' eggs, and oysters. Zierikzee is the chief town, with a pop. (1877) of 7617.

Schubert, Franz Peter, an illustrious German musician and the greatest of song composers, was born at Vienna, January 31, 1797. He was trained in the Imperial choir, and was the favourite pupil of Salieri. His precocity nearly equalled that of Mozart—at the age of twelve he had composed songs, sonatas, masses, and overtures in profusion. His short life was spent in obscurity, and his was the not uncommon fate of genius; neglected during life, his fame only blossomed after his death (19th November 1828). Like Heine, he transformed his sorrows into songs, of which he wrote at least 575. His three great collections alone, *Müllerlieder* (1828), *Winterreise* (1826-27), and *Schwanengesang* (1828), manifest the most extraordinary and prodigious lyric power. He raised the *Lied* to a high and distinct branch of art, and treated it in a manner in which he has had many imitators but no rival. Before his time the voice was sovereign. He was the first to assert the equal rights of the pianoforte. His accompaniments, rich in harmony and perfect in expression, are equal in beauty

to the pure, longing, lovely melodies to which they are wed. Goethe's and Schiller's lyrics derive new meaning from his sympathetic imagination. There is a grand dramatic power in his *Erkönig* and his *Wanderer* (both 1816). S. left in MS. 15 operas, 7 symphonies, including the beautiful symphony in C major, and many quartets, quintets, and trios. Song was the mission to which he was born, but his instrumental works are also full of creative genius, and of the utmost wealth of fancy and melodic power. See his *Life* by Dr Kreissle von Hellborn (Vienna, 1865), and Wilberforce's *F. S., a Musical Biography* (Lond. 1866).

Schu'mann, Robert, one of the most gifted of modern composers, and the ablest of musical critics, was born at Zwickau, Saxony, June 8, 1810. He studied law at the University of Leipzig, but finally chose music for his vocation in 1830. He was instructed in the pianoforte by Friedrich Wieck, and in composition by Heinrich Dorn, a much-loved master. The late works of Beethoven and the compositions of Schubert had a profound influence over him. In 1834 he started the *Neue Zeitschrift für Musik*, which he conducted for ten years in a broad, generous, and catholic spirit. He chastised Philistinism and quackery with scorpions, but was the warmest friend to earnest endeavour and real merit. In 1840 he married Clara Wieck, the daughter of his former teacher (born 1819), the most accomplished pianist of the day. His life till 1854 was a happy if a laborious one, spent in the affectionate pursuit of an art in which he lived and had his being. But in that year the dark shadow of mental gloom fell upon him and remained with him. He died at Bonn, July 29, 1856. S.'s works are of many-coloured variety, including symphonies, sonatas, cantatas, overtures, and songs. The *Symphony in B Major*, the musical illustrations of Manfred, the cantata *Das Paradies und die Peri*, the novelettes, arabesques, and intermezzi, would alone immortalise him. His style was that of a great romanticist. An enthusiastic and dreamy imagination carried him tragically over unknown paths, where he revelled in fantastic grace and an almost transcendental beauty. See the biographies of S. by Wasiliewski (Dresd. 1858) and Reissman (Berl. 1865). The second edition of his critical writings, *Gesammelte Schriften über Musik, &c.*, was published at Leipzig in 1875, and is partly translated in Fanny R. Ritter's *Music and Musicians, Essays and Criticisms by Robert S.* (Lond. 1877).

Schurz, Carl, an American politician, was born, 2d March 1829, at Liblar, near Köln, and educated at Bonn. He was involved along with Professor Kinkel in the revolutionary outbreaks in Germany in 1848-49; was imprisoned and escaped to Switzerland; but returned under an assumed name to Berlin, and assisted Kinkel to escape from Spandau in 1850. He then went to Paris and London, and in 1852 married and emigrated to America. Here he soon became prominent as leader of the German element in the Republican party. In 1858 he made his first speech in English, and attracted much attention by a series of lectures in New England in 1859-60. President Lincoln appointed him United States minister to Spain in 1861, but he resigned the same year and returned to America to take a prominent part in the war, rising to the rank of major-general on the Federal side. In 1866 he visited the Southern States as Special Commissioner, and published a masterly report on their condition. After editing successively the *Detroit Post* and the *Westliche Post* at St. Louis, he was elected United States senator for Missouri from 1869 to 1875. He was among the supporters of Horace Greeley for the Presidency in 1872, and in 1875 actively supported the candidature of President Hayes. Twelve of his principal English speeches were published at Philadelphia in one volume (1865).

Schuyler, Philip, an American general and statesman, was born of a wealthy family at Albany, 20th November 1733. He held some minor military command under the colonial government of New York, and on the outbreak of the Revolutionary War was appointed major-general and placed in command of the northern department. The failure of an expedition against Canada, and the insinuations it called forth, led him in 1777 to demand a court of inquiry, which entirely acquitted him of blame. But the events which preceded the battle of Saratoga in 1777 again raised complaints against him, and before the battle was fought he was superseded by General Gates, though he remained with the army. Another court of inquiry again freed

him from all blame, but he resigned his military commands. From 1778 to 1781 he was a member of Congress, and in 1789 he was appointed United States senator for New York. He died at Albany, November 18, 1804. See his *Life and Times*, by B. J. Lossing (2 vols. 1860-62; new ed. 1872).

Schuyl'kill ('hidden stream'), a river of Pennsylvania, U.S., which flows S.E., passes Pittsville, and joins the Delaware at Philadelphia. The S. is navigable for freight-boats throughout most of its course of 125 miles, provides part of the water-supply for Philadelphia, and at its mouth affords extensive wharfrage.

Schwab, Gustav, a modern German poet, born at Stuttgart, June 19, 1792, studied at Tübingen (1809-14), travelled through N. Germany, associating at Berlin with Fouqué and Franz Horn, and in 1817 became professor of ancient literature in the Upper Gymnasium at Stuttgart, in 1837 pastor at Somaringen, and in 1842 at St. Leonhardskirche in Stuttgart. Here he died November 4, 1850. His poems, first appearing in periodicals and almanacs, were collected in 2 vols. at Stuttgart (1828-29), and a *Neue Auswahl* was published in 1838 (4th ed. 1851). Among his other works are *Die Schwab. Alb.* (ib. 1823), *Der Bodensee, ein Handbuch für Reisende und Freunde der Natur, Geschichte und Poesie* (ib. 1827; 2d ed. 1839), *Deutsche Volksbücher* (2 vols. ib. 1836; 4th ed. 1858), *Die Schönsten Sagen des Classischen Alterthums* (3 vols. ib. 1838-40; 4th ed. 1857), and *Schiller's Leben* (ib. 1840; 2d ed. 1841-44). Excellent anthologies are his *Fünf Bücher Deutsche Lieder und Gedichte* (Leip. 1835; 4th ed. 1857), and *Deutsche Prosa von Mosheim bis auf unsere Tage* (2 vols. Stuttg. 1843; 2d ed. 3 vols. 1860). His ballads and romances are by far his best poems; in them he approaches nearer to Uhland than any other poet of the Swabian school. See S.'s biography by Klüpfel (3d ed. 1861).

Schwa'ben (Lat. *Suabia*, Eng. *Swabia*), a former province of South-Western Germany, bounded N. by Franconia and the Palatinate, E. by Bavaria, and W. and S. by the Rhine. Successively conquered by the Alemanni and Suevi, it was raised to a duchy of the Empire by Konrad I. (917), and in 1080 was bestowed by Heinrich IV. on his son-in-law Friedrich, the founder of the House of Hohenstaufen (q. v.). In the struggle for independence which followed on the extinction of that dynasty in 1268, numerous leagues and coalitions were formed, amongst them the Schlägelsbund (1367), Schwäbischer Bund (1376), Marbacher Bund (1405), and Grosser Schwäbischer Bund (1488-1533). From 1512 to 1806 S. was one of the six circles into which the empire was divided, and its territory at present belongs to Baden, Württemberg, and Bavaria. The title *Schwäbische Dichter*, formerly applied to the Minnesänger of the 13th c., has in more recent times been borne by a school of poetry, founded by Uhland (q. v.), and numbering among its members Schwab, Kerner, Forster, Mayer, Mörike, &c. See Pöster, *Pragmatische Geschichte von S.* (5 vols. Heilbronn, 1802-27).

Schwan'thaler, Ludwig Michael von, a distinguished German sculptor, was born at Munich, 26th August 1802. The son of Franz S., the court sculptor, his artistic education began at the age of sixteen, and on the death of his father in 1821 he completed several important royal commissions. After a brief visit to Rome, where he became acquainted with Thorvaldsen, he settled at Munich and there passed the remainder of his busy life, with the exception of two years (1832-33) spent at Rome in the preparation of designs for the Walhalla (see RATISBON). The favoured sculptor of King Ludwig, S. is identified with Munich as Rauch is with Berlin. He was prolific to a fault, and the city may indeed be said to be populous with his work. His most elaborate compositions, the pediments of the Walhalla, are singularly graceful and refined, and show a thorough knowledge of the masterpieces of antiquity. He modelled the colossal statue of Bavaria, 54 feet high, the 24 statues of the Munich Pinakothek, a bas-relief frieze 200 feet long for the Barbarossa Hall, the 12 statues of the ancestors of Wittelsbach, the 'Battle of Arminius' for the Walhalla, and statues of Goethe, Richter, Mozart, &c. S. was one of the leaders of the 'Romantic' movement in art, and the founder of the school whose chief disciples are Schaller, Widman, Zumbusch, and Brugger. He died 15th November 1848. See Trautmann, *S.'s Reliquien* (Mun. 1858).

Schwarz, Christian Friedrich, a celebrated modern missionary, was born at Sonnenburg in Prussia, October 26, 1762. After three years study at Halle, in 1749 he was ordained at Copenhagen, and next year joined the Danish mission at Tranquebar. In 1766 he transferred his services to the English Society for Promoting Christian Knowledge, removing in the same year to Trichinopoly, and in 1778 to Tanjore. Here he laboured with much devotion and success. His personal influence and the respect in which he was held by the natives are evinced by his being the only ambassador whom Hyder Ali would admit to his presence, and by his being able to persuade the suspicious and reluctant native farmers to bring food to the starving inhabitants of Tanjore on his personal pledge of payment. He died at Tanjore, February 13, 1798. Since 1787 he had been tutor and guardian of the son and heir of the Rajah of Tanjore, who erected a monument to his memory in the mission church there, while the E. India Company also placed a monument to him in St. Mary's Church, Madras. He aided Schultz in translating the Bible into Tamil. See his *Life and Correspondence* by Dr. H. Pearson (3d ed. 1839).

Schwarzburg, House of, one of the oldest German families, begins its authenticated history with Sizzo IV., Graf von S. und Käfernberg (died 1160), who bequeathed S. to his eldest son, Heinrich I., and Käfernburg to his younger son, Günther II. The death of the former in 1184 united the dominions of both under Günther, with whose two sons, Heinrich III. and Günther III., they were again divided. In 1349 Günther XIX., younger son of Heinrich IX., was elected Emperor, but died in the same year. Günther XXXVIII., who died 1553, was the latest common ancestor of the now flourishing line of the house of S., his eldest son, Johann Günther, founding the line of S.-Sondershausen (q. v.), and Albrecht that of S.-Rudolstadt (q. v.).

Schwarzburg-Rudolstadt, a German principality lying on the N. side of the Thüringer-wald, surrounded by Prussian territory and the Saxon duchies, and consisting of the Upper lordship (284 sq. miles; pop. (1875) 60,162), and the Lower lordship (80 sq. miles; pop. (1875) 16,154). The surface is covered with spurs of the Thüringer-wald and watered by the Schwarza, the Saale, and the Ilm. The soil is fertile, and produces abundantly corn, potatoes, tobacco, hops, fruits and vegetables. Wine is produced in the Saale valley. Forty per cent. of the surface is covered with wood, the half of which is State property. The chief minerals are copper, cobalt, porcelain-earth, slate, marble, peat, lignite, and salt. Porcelain and glass are manufactured. The form of government is a constitutional and hereditary monarchy. The constitution dates from 1854 (modified November 16, 1870). The Diet consists of 4 deputies of the highest assessed inhabitants, and 12 deputies elected by the people. The budget for the years 1876-78 states the revenue at £89,703, and the expenditure at £88,856.

Schwarzburg-Sondershausen, a German principality in Thuringia, almost surrounded by Sachsen-Preussisches, and consisting, like S.-Rudolstadt, of an Upper lordship (area 132 sq. miles; pop. (1875) 31,321), and a Lower lordship (area 201 sq. miles; pop. (1875) 36,159). Of the surface, watered by the Helbe and Wipper, 29 per cent. is under wood, of which 65 per cent. is the property of the state. The crops raised are the same as those in S.-Rudolstadt. The chief minerals are manganese, iron ores, and lignite. The principal industries are tanning, linen, cotton, glass, porcelain manufacture, and brewing. The government is similar to that of S.-Rudolstadt. The budget (1876-79) states the annual revenue at £108,237, and expenditure £107,567.

Schwarz'enberg, a German princely house, founded by Erking von Seinsheim (originally *Sawusheim*), who in 1406 got the office of Hereditary Master of the Hounds in the Duchy of Franconia, and was in 1417 made baron by the Emperor Sigismund. He bought the lordship of S. in Franconia in 1420, and in 1429 received a seat and vote in the Franconian *Grafenkollegium*. He died in 1437, and his two sons founded the Bavarian and Franconian branches, the former of which became extinct in 1646. The representatives of the Franconian, made 'counts of the empire' in 1599, then became leaders of the house, and in 1674 were raised to the dignity of 'princes of the empire.' The most eminent scions of the family have been—
1. **Johann Freiherr zu S.**, belonging to the Bavarian branch.

Born in 1463, he became a field-officer under Maximilian I., but relinquishing military life was appointed chamberlain to the Bishops of Bamberg. He drew up the *Bamberger Halsgerichtsordnung* in 1507, and translated Cicero's *De Officiis*. He laboured much for the spread of morality and classical culture, and helped to pave the way for the Reformation. He died in 1528. See Herrmann's *Joh. Freiherr zu S.* (Leip. 1841).—2. **Adam Graf zu S.**, belonging to the Franconian branch, born 20th August 1587, served for some time in the imperial army, and was made premier by Georg Wilhelm of Brandenburg. He zealously supported Austria and opposed Gustavus Adolphus during the Thirty Years' War. On the Great Elector's accession S. was thrown into Spandau prison, where, after four days' confinement, he died, 17th March 1641.—3. **Karl Philipp Fürst von S.**, was born at Vienna, 15th April 1771, and served in the Austrian army against the Turks (1789). By 1799 he had attained the rank of field-marshal-lieutenant, as which he fought at Hohenlinden. In 1805 he commanded a division under Mack at Ulm and Austerlitz. In 1808 he went to St. Petersburg as ambassador, but next year was present at Wagram and skilfully conducted the retreat. He negotiated the marriage between Napoleon and Maria Louisa, and in 1812 Napoleon gave him an auxiliary command of 30,000 Austrians during the invasion of Russia. Created, however, field-marshal and generalissimo of the Allies (1813), he helped to crush the French Emperor at Kulm and Leipzig; and after the battle of Waterloo he led the army of the Upper Rhine to Paris. S. died at Leipzig, 15th October 1820. See Prokesch-Osten, *Denkwürdigkeiten aus dem Leben des Fürsten S.* (Vien. 1823).—4. **Felix Ludwig Johann Friedrich Fürst S.**, nephew of the preceding, was born 2d October 1800, entered the army in 1818, went as diplomatic attaché in 1824 to St. Petersburg, and subsequently to London, Madrid, Lisbon, Paris, Berlin, the Hague, and Turin. In 1846 he was ambassador at Naples, but having been insulted by the mob left in 1848. He took part in the war with Italy, and conducted the subsequent negotiations. After the Revolution of October he entered Vienna at the head of the troops, and was made minister president. By his activity he crushed the Hungarians and facilitated the political unity of Austria. He died 5th April 1852. See Berger's *Leben* (Leip. 1852).

Schwarz'wald. See BLACK FOREST.

Schwedt, a town of Prussia, province of Brandenburg, on the left bank of the Oder, 31 miles above Stettin, and 60 miles N.E. of Berlin by rail. It was formerly the residence of the Markgrafs of Brandenburg-S., has a castle of 1580, and manufactures soap, tobacco, cloth, &c. Near it is the château of Monplaisir. Pop. (1875) 9592.

Schwegler, Albert, a member of the Tübingen school of German theology, was born at Michelbach in Württemberg, February 10, 1819. After studying at Tübingen (1836-40), he became in 1842 parish vicar at Bebenhausen, but resigned his charge in 1843, when he became a *privat-docent* in philosophy and classical philology at Tübingen. He received in 1848 the extra-professorship of Roman Literature and Antiquities, and still later that of Ancient History. He died January 5, 1857. *Die Geschichte des Philosophie*, his best-known work (Stuttg. 1848; new ed. 1857), has been translated into English by Professor J. H. Seelye of Amherst (New York, 1856) and J. H. Stirling (6th ed., Lond. 1877). His other works are *Der Montanismus und die Christliche Kirche des 2. Jahrh.* (Tüb. 1841), *Das Nachapostolische Zeitalter* (ib. 2 vols. 1846), *Röm. Geschichte* (3 vols. Stuttg. 1853-58), and *Geschichte der Griechischen Philosophie* (Tüb. 1859). He also published editions of the *Clementine Homilies* (Stuttg. 1847); Aristotle's *Metaphysics*, with translation and commentary (4 vols. Tüb. 1847, et seq.); and Eusebius' *Ecclesiastical History* (2 vols. Stuttg. 1852).

Schweidnitz, a town of Prussia, province of Schlesien, 42 miles S.W. of Breslau by rail, was formerly capital of a principality of that name. During the Seven Years' War it sustained four sieges, two by the Prussians and two by the Austrians. It has manufactures of wool, leather, gloves, farm implements, and beer. Pop. (1875) 19,892.

Schweinfurt, a town of Bavaria, on the Main, 34 miles W. of Bamberg by rail. It has a townhouse of 1570, a Gothic church of the 13th c., and a gymnasium founded by Gustavus

Adolphus, who also constructed the fortifications which still in part surround the town. The manufactures are sugar, tobacco, paperhangings, saltpetre, potash, ultramarine, S. Green (q. v.), plumbago, and cotton. There are also breweries, markets for cattle and horses, and the neighbourhood produces wine. Pop. (1875) 11,250. S is the Roman *Trajectus Suevorum*, or *Suevofurtum*. S became a free city in 1112, and in 1814 it was united to Bavaria. A medallion (since 1867) marks the house where the poet Ruckert (q. v.) was born.

Schwein'firt Green (Ger. *Wienergrün*), aceto-arsenite of copper, is a velvety green pigment, more brilliant, lighter, and less affected by damp than Scheele's Green (q. v.), as a substitute for which it is employed. It was discovered at Schweinfurt in 1814, and is prepared by fusing arsenious acid and acetate of copper. It is used in Paris for tinting fabrics for artificial flower-making, is known in commerce as *Paris Green*, *English Green*, *Emerald Green*, &c.

Schwein'furth, Georg August, a distinguished African explorer, was born at Riga, 30th December 1836. He studied natural science, especially botany, at Heidelberg, at Munich, and at Berlin, where he took his degree as Doctor of Philosophy. He was entrusted to arrange and describe the collection of plants made by the young Freiherr von Baimm on his fatal journey with Dr Hartmann in the Nile valley in 1860. In 1863 he himself botanised in the Nile delta, passed along the shores of the Red Sea, skirted the highlands of Abyssinia, and after reaching Khartum returned to Europe in 1866. Having submitted to the Royal Academy of Science of Berlin a plan for the botanical exploration of the equatorial regions lying W. of the Nile, he received a grant from the Humboldt Institution and set out for Egypt in 1868. During three years he was absent in Central Africa, and before he returned his name had already become famous. Joining the party of an intelligent ivory-trader at Khartum, he passed up the Nile to the point where it suddenly takes its last great southerly bend, then striking out of the beaten track he explored for the first time the basin of the Gazelle, the great western affluent of the Nile, and visited the country of the Bongos (q. v.), Dinkas (q. v.), Dyooks (q. v.), and Niam-Niams, and the unknown kingdom of Monbuttoo. In the latter country he discovered the great westerly-flowing Welle, identified by Stanley (1876) as the Aruwini, which has a breadth of 2000 yards at its confluence with the Congo. This river, according to Stanley (*Through the Dark Continent*, 1878), will be of immense importance in the commercial development of Africa. The work in which S gave to the world the results of his travels, *Im Herzen von Afrika* (2 vols 1873; Eng 1873; Fr. 1875), is alike remarkable as a contribution to the Nile problem, a complete scientific account of vast and newly-discovered regions, and as a fresh, fascinating, highly skilful narrative. The most thoroughly equipped of all African explorers, S is an enthusiastic scientist, a master of botany, and an accomplished draughtsman, and unites with rare powers of observation and endurance the keen, adventurous spirit of the traveller. As an instance of his wonderful patience and perseverance, for the last six months of his journey, when deprived of mechanical means of computing distance, he had recourse to counting his footsteps. In this way he recorded a million and a half strides, and to the practice ascribes 'some of the most reliable results of the survey of my route'. S by his discovery of the Akkas put an end to all doubt as to the existence of a dwarf race in Central Africa (see GIANTS AND DWARFS). His other works are *Plante quædam Niloticæ* (1862); *Beitrag zur Flora Æthiopiens* (1867); *Reliquia Kotschyanae* (1868), and *Artes Africanae* (1875). In the service of the Khedive he established a geographical society in Cairo, 1875, and, along with Dr Gussfeldt, travelled in the deserts between the Nile and Red Sea. In 1876 a brother of S founded in his honour a S. Institute at Riga, with a capital of £1600.

Schwer'in, a town of Germany, capital of the grand-duchy of Mecklenburg S., prettily situated on the Schwerinsee (14 miles long by 3½ broad) and several smaller lakes, 47 miles S.E. of Lubeck by rail. It has a fine castle, erected 1845-58, a Gothic cathedral (begun in 1248, completed in the 15th c.), an arsenal (1844), a theatre (1832-35), a picture-gallery (800 pictures), and several higher schools. The chief industries are iron-smelting, and the manufacture of tobacco, chocolate, and carriages. S was an ancient Wendish settlement, and from 1170

to 1624 was a bishop's see. Pop. (1875), with garrison (346), 27,989. See *Beschreibung von S.* (Wismar 1857).—**Schwerin an der Warthe** (Polish *Skwierzyna*), a town of Prussia, in Posen, on the river Warthe, 61 miles W. by N. of Posen, has a trade in horses, and manufactures brandy. Pop. (1875) 6580.

Schwer'in, Kurt Christoph, Graf von, a distinguished general of Friedrich the Great, was born in Swedish Pommern, October 16, 1684. After studying at Leyden, Griefswald, and Rostock, he entered the Dutch service as ensign in 1700. In 1704 he fought under Marlborough and Prince Eugene, became captain in 1705, and next year entered the service of the Grand Duke von Mecklenburg. In 1711 he was despatched on a secret mission to Kail XII. at Bender, and in 1719 settled favourably for the Duke his quarrel with the nobility, after defeating their army at Waltmühlen. In 1720 he entered the service of Prussia, acted as governor of Peitz, and in 1740 was ennobled by Friedrich II., appointed field-marshal, and raised to the command of the right wing in the first Silesian War. He contributed greatly to the victory at Mollwitz in 1741, and on the conclusion of the peace was appointed governor of the forts Neisse and Brieg. On the outbreak of the second Silesian War he invaded Bohemia, and directed the siege of Prag, which fell September 16, 1744. In 1756, on the outbreak of the Seven Years' War, he took the command of the third Prussian army, and prevented the junction of Generals Piccolomini and Browne, but fell in the storming of the Austrian camp before Prag, May 6, 1757. S was the most popular general in the Seven Years' War. A marble monument was erected by the king to his memory in the Wilhelmsplatz in Berlin, and his name is still commemorated in the popular songs of Germany. See *Leben des Grafen von S.* (Berl. 1790).

Schwyz, one of the mountain cantons of Switzerland, bordering N. on the Lake of Lucerne, and S. on that of Zürich. Area 350 sq. miles, pop. (1876) 49,216 (of whom 98 per cent. are Roman Catholics). The highest point in the canton—and the only one which rises above the snow-line—is the Rieselstock, 9200 feet high. S also contains the beautiful group of the Righi (q. v.); and other peaks are those of the Rossberg (5141 feet), the Great Mythe (6243), and the Little Mythe (5954). The inhabitants are chiefly engaged in rearing cattle, in cultivating fruit, and in making cotton, silk, and straw wares. Only a very small extent of country is cultivable, and a great portion is under wood. S. was one of the three original Swiss cantons, since 1848 its government has been thoroughly democratic, consisting of a council of 81 members, whose enactments must be ratified by the people at large.—S., capital of the above canton, nestles at the feet of the Great Mythe and Little Mythe, has a good parish church (1774), and a pop. (1876) of 6163.

Sciacc'a (the *Therma Selinuntina* of Pliny), a walled city on the S coast of Sicily, 38 miles W.N.W. of Girgenti. The chief edifices are a cathedral founded by Roger I's daughter Julietta, the ruined castles of the Luna and Perollo families, the modern palazzo of the Marchesa San Giacomo, and such quaint mediæval buildings as the Casa Triolo and Casa Starepinto. The trade of S is almost nil, but fishing and the manufacture of pottery are carried on to some extent. Pop. (1874) 19,209. The volcanic Monte San Calogero (1279 feet), 3 miles to the E., abounds like the intervening valley in hot sulphur springs, which attract many patients; and off the coast a valuable coral reef discovered in 1875 employs several hundreds of coral-fishers.

Sciaen'idæ, a family of Teleostean fishes, of the *Acanthopteros* section of the order. It includes the Maigre (*Sciaen aquila*) of the Mediterranean Sea, an occasional visitant to the British coasts, the *Pogonias* or Drumfish (q. v.), and other forms. The S. are allied to the perches. They have a single row of teeth in each jaw. The air-bladder is often provided with appendages, the body is compressed, and the dorsal fin is either single or double.

Sciatic'a is the term applied to neuralgia of the great sciatic nerve. The pain of S. is referred to the course of the sciatic nerve or its branches, and may be confined to the gluteal region or upper part of the thigh, spreading into neighbouring parts, and running down the back of the thigh to the leg and soles of the feet. Sometimes only isolated parts are affected, as the knee-joint, the calf of the leg, or the sole of the foot. S. generally

lasts for two or three months, and is apt to recur. It is often associated with general debility, and sometimes there is a previous history of gout, rheumatism, or syphilis. S. is very obstinate as regards treatment; but the most reliable medicines are aconite, strychnia, phosphorus, and iron.

Science is knowledge systematised. By generalisation from known facts, it aims at the establishment of broad principles from which these facts are immediate deductions, and by which they are linked together in one consistent whole. Such is S. generally. The various facts of experience, however, which fall within the range of scientific discussion, naturally group themselves into several categories which are collectively known as 'the sciences.' For example, there is mathematics, the S. of number and magnitude, which of all sciences is the most complete in itself, being based on a few principles, axiomatic in their simplicity, universal in their comprehensiveness. There is natural philosophy, embracing the special departments of physics, chemistry, geology, and astronomy, and treating of all phenomena of inanimate nature. The great generalisation which here holds is the conservation of energy, a principle which is to a certain extent applicable to phenomena of life and mind. As we pass to these higher subjects, the principle of the transformation of energy merges into that of evolution, whose laws are but now beginning to be understood. Perhaps the most natural classification of the sciences is that here indicated, namely, the grouping of them according as they discuss energy, life, or mind. To give a more elaborate classification has been attempted, but with small success; and even in such a general arrangement it is impossible to draw hard and fast lines of separation. See BIOLOGY, GEOLOGY, PHYSICS, PSYCHOLOGY, &c., for more details regarding the nature of the several categories in which the sciences are grouped. With metaphysics S. has nothing in common. It builds upon facts of experience, postulating the existence of matter and energy.

Scilla. See SQUILL.

Scilly Isles, a group of about eighty islands, islets, and rocks, scattered over an area of 10 sq. leagues, 25 miles W.S.W. of Land's End, and 36 of Penzance, the nearest port. Only five are inhabited—St. Mary's, Trescow, St. Agnes, St. Martin's, and Bryher—and these with Sampson have an area of 3560 acres, and a pop. (1871) of 2090; 2627 in 1851, a decrease due to emigration. Rising steeply from the sea, and lashed by the full fury of Atlantic winds and waves (the latter sometimes exceeding a force of 6000 lbs. per sq. foot, and towering to a height of over 100 feet), these islands have been a terror to mariners from the day when Sir Cloudesley Shovel perished off them with four of his vessels (1707) to the loss of the German mail-steamer *Schiller* (1875) with 312 lives. Their formation is granitic, the soil a fertile peat, and so mild is the climate that semi-tropical trees and plants (palms, flowering alocs, cacti, rare ferns, &c.) flourish unchecked by winter cold. Early crops of potatoes and asparagus are harvested in May, and the rearing and export of these for the London market form with fishing and pilotage the staple industries of the Scillies. Each of the inhabited islands has a modern church, but the Abbey of Trescow lies in ruins, and the old church of St. Mary's is now only used as a mortuary chapel. Other lions of the S. I. are the residence of the Lord Proprietor, with exquisite gardens of 15 acres, adorned by the figureheads of wrecked vessels, Oliver's Tower, and King Charles's Castle, all on Trescow; on St. Mary's, Star Castle (1593), the Logan Stone of 45 tons, and the Rock Basins of Peninnis Head, variously ascribed to Druids or the action of the weather; the lighthouses of St. Agnes and of the Bishop's Rock. Hugh Town, the capital, on St. Mary's, has a good harbour, which was entered (1877) by 209 vessels of 14,716 tons, and cleared by 194 of 13,499, the imports amounting (1876) to £2104.

The Greeks probably included both the S. I. and the western part of Cornwall under the name *Cassiterides* (Sansk. *kastira*, 'tin'), as there are hardly any traces of tin-workings in the islands themselves. Æthelstan wrested them from the Danes in 928, and Henry I. granted them to Tavistock Abbey, with whose other possessions they passed to the Crown at the dissolution of the monasteries. Leased by Elizabeth to the Godolphins, they furnished an asylum to Prince Charles (1646), were captured by Blake for the Parliament (1651), and in 1830 passed by purchase to Mr. Augustus Smith, the 'King of Scilly' (died

August 31, 1872). Under the latter's beneficent but despotic rule, the islands emerged from their former rude and thriftless condition to a state of prosperity, where taxes, licences, and pauperism are things unknown. He encouraged horticulture, founded schools with compulsory attendance, established a regular service of steamers, and brought the islands into closer communication with the mainland by a submarine cable. See M'Mullen's *S. I.* (Lond. 1869).

Scimitar (Pers. *chimicher*), an Oriental sword, the blade of which is single-edged, short, curved, and broadest at the point end. It is a favourite weapon of the Persians and Turks.

Scinde (Sansk. *Sindh* = Ind), a province of British India, on the N.W. frontier, forming an appendage to the Bombay Presidency, from which it is divided by the Runn of Cutch and the peninsula of Gujerat. It occupies the lower basin and the delta of the Indus, being separated on the W. by mountains and the river Hubb from Beluchistan, and bounded on the E. by the Thur or great Indian desert in Rajputana. The total area, excluding the dependent state of Khyrpore (q. v.), is 46,600 sq. miles, and the pop. (1872) 2,192,415. It is divided, for administrative purposes, into five districts or collectorates, the whole being under the charge of a commissioner, who resides at Kurachi, the seaport and largest town in the province. Hyderabad, the former native capital, and Shikarpur, the centre of trade with Afghanistan, are the next most important towns.

Soil, Products, Trade, &c.—The greater part of S. forms a level sandy plain formed by the alluvial action of the Indus, but the N.W. portion is broken up with hills. The average temperature of the summer months is 95° F.; of the winter, 60°. The thermometer often rises to 110°, and sometimes falls below freezing point. Little or no rain falls; sometimes two or three years pass without a shower, and the annual average is only 5 inches. Agriculture, therefore, is entirely dependent upon irrigation from the Indus and subsidiary canals. The chief food crops are jowari and bajri, two sorts of millet; rice and wheat are also grown, as well as cotton, oil-seeds, and tobacco. In 1876-77, out of 3,000,000 cultivated acres, 917,000 were under millets, 511,000 under rice, 354,000 under wheat, and 74,000 under cotton. Wild animals include the lion and the wild ass; the chief domestic animal is the camel; buffaloes are largely bred in the swamps, and sheep and goats in the hilly tracts; the horses are small but hardy. The trade of S. almost entirely centres at the port of Kurachi (q. v.). The exports are cotton, wool, and grain. Cotton was first exported in 1861, ten years later the quantity despatched was 70,000 bales, and 12,000 cwt. unpressed. The wool comes chiefly from Beluchistan; the first consignment was in 1853, and in 1870 the export was valued at £300,000. In 1876-77 the total exports, foreign and coastwise, were valued at nearly £2,750,000 sterling, including grain, £485,000, cotton £390,000, wool £719,000; the imports were valued at more than £2,500,000, chiefly European piece-goods, native piece-goods, and treasure. The manufactures are inconsiderable, the chief being carpets at Shikarpur, and gold and silver embroidery at Hyderabad. A railway from Kurachi to Kotri, 106 miles, was opened in 1861, and is now in process of extension to the Punjab. Steam navigation on the Indus, which dates from 1835, is under the same management as the railway. The total revenue of the province in 1870 amounted to £622,188, of which the land tax brought in two-thirds. This tax was formerly paid in kind, at the rate of one-third of the gross produce. There is now a fixed rate, payable in money, which varies with the facilities for irrigation; the average land tax and water charge is 4s. 6d per acre. Education has of late years made much progress. In 1870 there was a total of 436 Government and private schools, attended by 14,397 pupils; the expenditure was £13,887. Vaccination is also being extended, and is readily welcomed by the Mahomedans. The police force numbers altogether 3885 officers and men. There are 900 British and 2000 native infantry, besides three regiments of S. horse, stationed at Kurachi, Hyderabad, and Jacobabad.

Race and Language.—The great majority of the population, 78 per cent., are Mahomedans, who may be divided into two classes—the Scindis proper, who are probably the original Hindu inhabitants converted to Islam, and the subsequent invaders from Beluchistan and Afghanistan. The Hindus, who form only 18 per cent., are chiefly engaged in trade. They are said to have mostly come from the Punjab, and are not very strict in

their religious observances. The language spoken is Scindi, a most heterogeneous compound of Sanskrit and Arabic origin, which has no literature, and uses either the Hindi or Arabic alphabet.

History.—The Hindu kingdom of S., which included the Punjab, and whose capital was Alor, near the modern Rohri, was conquered by the Mahomedans in 713 A.D., 300 years before the invasion of Hindustan proper. It was at first a dependency of the Arabian califs, and five independent dynasties are counted before the Talpur family, who are of Beluchi origin, established themselves in 1783. It was with this family, whose dynastic title was Amir (*Mir*), that the British came into collision in connection with the Afghan war and the free passage of the Indus. In 1839 it was found necessary to occupy the fort of Kurrachi, and to force a passage up the river for the conveyance of military stores contrary to a previous treaty. Sir James Outram was appointed Resident at Hyderabad; but in 1842 Sir C. Napier was sent with supreme political and military authority to enforce demands which involved the surrender of the independence of the country. Both these officers expressed their disapproval of the orders of the government which they had to carry out. The Amirs were divided among themselves; and in February 1842 their Beluchi army attacked the Residency, which Outram was compelled to evacuate. Two days later, Sir C. Napier won the decisive victory of Meeanee (q. v.), with only 2800 men of all arms against a warlike enemy of 28,000 strongly posted. The Amirs surrendered Hyderabad with a treasure of £1,000,000 sterling, and also gave themselves up. After another battle at Dubba, S. was declared a conquered country, and permanently annexed to the British possessions in India. Sir Bartle Frere was Commissioner of S. from 1851 to 1859, a period which includes the Mutiny, when the Sepoys mutinied at Kurrachi, but the outbreak was promptly repressed. The descendants of the dispossessed Amirs still reside at Hyderabad. It has recently been proposed to separate S. from Bombay, and form it into a new province, together with the frontier districts of the Punjab. See *Gazetteer of Sindh*, by A. W. Hughes (Lond. Bell & Sons, 1874); and Burton's *S. Revisited* (Lond. 1877).

Scindiah (Sindia), the hereditary title of the great Mahratta dynasty which rules at Gwalior (q. v.) in Central India. The founder, **Ranojee S.**, of Sudra descent, was originally a slipper-bearer to the Peishwa, or hereditary prime minister of the Mahrattas. He died in 1754.—His grandson, **Junkojee S.**, was captured and beheaded by the Afghans after the battle of Paniput in 1761, by which the Mahratta designs of universal empire in India were finally crushed.—**Mahadojee S.**, a younger son of the founder of the family, succeeded, and became the leading member of the Mahratta confederacy. Till his death in 1794 he was supreme in Hindustan. His army was officered and drilled by Frenchmen; the Mogul Emperor, Shah Alum (q. v.), was merely a puppet in his hands: he contended not unsuccessfully against the British, and established a predominant influence at the Peishwah's court at Poonah.—He was succeeded by his grand-nephew, **Dowlut Rao S.**, who was entirely defeated by Sir Arthur Wellesley in the Deccan, and by Lord Lake in Hindustan in 1803. During the fourth Mahratta war of 1817, he was compelled to give an unwilling co-operation to the British. After his death in 1827 the state became disorganised, and order was only restored by a British army in 1843 after two pitched battles.—The present chief, **Babajee Rao S.**, was adopted at that time. He was loyal during the Mutiny of 1857, though the Gwalior contingent joined the rebels at Delhi. He inherits the military instincts of his predecessors, and himself manoeuvres an army of 22,000 men. He also conducts the civil administration. His revenue is nearly one million sterling. In 1875 he attracted attention by arresting with his own hand a supposititious Nana Sahib. In 1877 he was appointed G.C.B. and general in the British army. But despite these honours he does not attempt to conceal his dissatisfaction at the continued occupation of his fortress of Gwalior by a British garrison. In September 1878 he was invested with the Star of India.

Scink or **Skink** (*Scincus*), a genus of *Lacertilia*, or Lizards, forming the type of a distinct family—that of the *Scincidae*. The head is conical, the eyelids are well developed, and the nostrils open in a large scale situated on the nose. Limbs are usually present, although in some members of this family they may be rudimentary. The *S. officinalis* is the Common S., and is found in N. Africa and some parts of Asia. It attains a length of 6 or

7 inches, and is of a reddish grey colour, banded with darker patches, while below, the colour is silvery white. The S. inhabits the sand, in which it burrows, when disturbed, with great agility. The specific term *officinalis* is derived from the repute in which this lizard was formerly held by the early practitioners of the medical art.

Scintillation of the stars is the twinkling or tremulous motion which stars appear to possess. The planets, except when near the horizon, do not so twinkle; and it is by their steady light that they are at once recognised. These considerations, together with the undoubted fact that stars twinkle more at some times than at others, suggest the causes of S. to be the excessive minuteness of the apparent diameter of a star and the disturbing influence of the air. The feeble pencil of rays coming from a star is so refracted and broken up by the air through which it travels that it reaches the eye in a more or less discontinuous manner. The quieter and more homogeneous the atmosphere is, the less evident the twinkling; and the nearer the star to the horizon the greater the scintillation, since the rays have to travel through a thicker stratum of the air. Violent twinkling on a clear still night, therefore, indicates an unsettled state in the higher regions of the air, which will probably ere long find its way into the lower regions; and observation has established such a connection between the weather and the S. of the stars.

Sci'o, or **Khi'o** (anc. Gr. *Chios*; Turk. *Sakisadasi*), a Turkish island of the Aegean, to the S. of the Gulf of Smyrna, 5 miles from the mainland. It has an extreme length of 32 and breadth of 18 miles, an area of about 400 sq. miles, and a male pop. (official *Salname* for 1877) of 18,599. The surface is mountainous, especially in the N., attaining in Mount Elias (anc. *Pelimeus*) an elevation of 4156 feet. Wood and water are scarce, but the soil is of great fertility, yielding in abundance figs, oranges, citrons, pomegranates, and vines, from which an excellent wine is made. Of four harbours, the best is Delphino, on the S. coast, which carries on a considerable export trade in fruits, cotton, wool, silk, leather, raki, and gun-mastic; and in 1873 there cleared 3027 sailing vessels of 92,398 tons, besides 352 steamers of 266,780 tons. On the eastern coast is Castro, the capital (pop. 13,000), with a castle, four mosques, two lighthouses, and a harbour choked up with sand. A political memoir by Prince Gortschakoff gives S. 450 vessels, 586 churches, and 9 convents, the most important of which, Nea-Moni, possesses one-sixth of the island. The birthplace of Ion, Theopompus, Theocritus, and, according to one tradition, Homer ('the blind old man of Sci'o's rocky isle'), S. with the other Ionian States was subject to Persia (494–479 B.C.), and was next a member of the Athenian League, till an attempted revolt (412) led to its devastation. For service in the Syrian and Mithridatic wars, it received the Roman franchise; it was captured by the Genoese (1346) and by the Turks (1566); and on the outbreak of the Greek insurrection (1822) was the scene of frightful cruelties on the part of the Turks, which reduced the population from 130,000 to 16,000. See 'The Vilayet of the White Archipelago' in the *Geographical Magazine* for August 1878.

Scioppius (Latinised form of Kaspar Schoppe), a celebrated German philologist, was born at Neumark, 27th May 1576. He studied at Heidelberg, Altdorf, and Ingoldstadt, and had already published *Poemata Varia* (Heid. 1593), and *Verisimilium Libri IV.* (Nurn. 1596), when in 1597 he visited first Rome, then Bohemia, Poland, and Holland, returning to Rome in 1598, when he abjured the Protestant faith. Here he was greatly favoured by the Pope, was made a count, and got a pension of 600 crowns. In 1607 he commenced his long series of invectives with an attack on Scaliger, followed by numerous pamphlets against the Protestants, whom he proposed to 'exterminate.' He next assailed James I. of England, for which, three years after, he was beaten by the servants of the English ambassador at Madrid. From 1618 to 1630 he lived chiefly at Milan, planning a reform of Latin grammar which proved impracticable. His next attacks were directed against the Jesuits, whom he suspected of frustrating his claims at the Diet of Ratisbon. In 1636 S. retired to Padua, where he continued to study industriously in seclusion. He published a defence of himself and some political tracts against Machiavelli. He died at Padua 19th November 1649. His numerous lampoons exhibit a profound knowledge of at least the lower side of human nature; his learning

was undoubtedly great, and his mastery of Latin style not inferior to that of Scaliger. Among his writings may be mentioned *Suspectarum Lectionum Libri V.* (Nürnberg, 1597), *Commentatio de Aric Critica* (Nürnberg, 1597), *Observationes Linguae Latinae* (Frank, 1609), *Grammatica Philosophica, sive Institutiones Grammaticae* (Mil. 1628), *Paradoxa Literaria* (Mil. 1628), and *De Scholarum et Studiorum Ratione* (Pad. 1636).

Scipio, Publius Cornelius, surnamed **Africanus** **Major**, one of the most renowned of ancient Romans, was the son of Publius Cornelius S., and was born at Rome in 234 B.C. In 218, when only seventeen, S. was with his father at the battle of Ticinus, and is said to have saved his life. He fought as a *tribunus militum* at Cannæ (216), and after the battle rallied some of the fugitives. He had gained great popularity, when in 212 he was chosen *curule aedile*. A tribune, indeed, objected that he was too young. 'If I have votes enough, I shall have years enough,' was the answer. In 211 his father fell in Spain, and next year the Senate increased the forces there and placed them under a proconsul. For this hazardous office S. was the only candidate, and the people, reassured by his confidence, elected him unanimously. He arrived in Spain during that summer. The peninsula had been wholly subdued by the Carthaginians, who had three armies there under the two Hasdrubals and Mago. Disunion among them, however, aided S. He at once boldly attacked New Carthage, their chief stronghold and arsenal, and carried it by storm in one day. S. found here, besides supplies, many hostages, by his leniency towards whom he won over the native Spanish. In 209 he brilliantly defeated Hasdrubal at Bæcula. Next year Mago was beaten by the propretor Silanus, and withdrawing to southern Spain, he united with Hasdrubal, son of Gisco. They long declined battle, but in 207 were decisively crushed by S. at Ilipa. The Carthaginians fled to Gades, the native chiefs declared for Rome, and Spain lay at S.'s feet. Bent on the final overthrow of Hannibal, he now visited Africa to gain the alliance of Massinissa king of Numidia, where he met Hasdrubal on friendly terms. Returning to Spain, he rigorously crushed a native rebellion, and soon after, though dangerously ill, quelled a legion which had mutinied. Then, Gades having surrendered, he resigned his command and returned (206) to Rome. In 205, though only thirty, he was elected consul and received the province of Sicily, with leave to invade Africa, but with no forces; yet he got an army together, composed largely of volunteers, and sailed for Africa in 204. Massinissa joined him, while Syphax, another Numidian king, supported Carthage. S. burned the Carthaginian camp in 203 and shortly after routed an army under Hasdrubal. Hannibal now arrived and sought peace, but S.'s terms were too severe, and the armies met for a supreme struggle at Zama, 19th October 202. The victory fell to S., and in 201 his humbled foe signed a peace. S. returned to Rome in triumph. He received the surname *Africanus*, and the people wished to give him a dictatorship and other honours, which he wisely declined. In 194 he was again consul. In 193 he crossed to Africa and met Hannibal. In 190 he served under his brother in the war against Antiochus. S.'s foes now grew active. Cato, Gracchus, and others accused him of extravagance and treachery. He was tried on the anniversary of Zama. Reminding the people of that event, he rushed to the capitol to return thanks for it, and the people followed. Next day he left Rome, which he never entered again, and died (183) in voluntary exile at his country seat at Liternum in Campania. S. was the greatest Roman commander before Julius Caesar. Not to be compared with his illustrious adversary in originality, resource, subtlety, and daring, he displayed an indomitable resolution, an imperious will, an exalted faith in his country's destinies, and in the favour of the gods towards himself that enabled him to use with irresistible effect the soldiery of Rome, and to utterly vanquish the most brilliant military genius of antiquity. His Grecian culture shed a halo of refinement round his image, and we are tempted to forget in the hero and scholar the insolent rebel against the majesty of law.—**Publius Cornelius S. Æmilianus**, surnamed **Africanus Minor**, son of L. Æmilius Paullus, and adopted by Publius Scipio, son of the preceding, was born at Rome, 185 B.C. He fought at Pydna in 168. While in Greece he acquired a life-long love of Greek literature and art, and began his friendship with Polybius. In 151 he served in Spain with great personal bravery, and in 149 went to Africa as a military tribune and shared in the third

Punic War. His genius was the secret of every Roman success. When he returned to Rome in 148 all went wrong, and he was unanimously recalled to complete the ruin of Carthage (147-46). On his return home he was awarded a splendid triumph. In spite of his Grecian tastes he maintained simplicity of life, and when censor in 142 got many enemies by his efforts to suppress luxury. In 139 he was even tried, but was acquitted. In 134 he was re-elected consul and despatched to subdue Spain, which he accomplished by the capture of Numantia (133). At this time his brother-in-law Tiberius Gracchus was heading the popular movement for reform. S. was a moderate conservative; he recognised the existence of social and agrarian evils, but one or two faint efforts at reform had convinced him that a revolution would be necessary to cure the evils of the state, and S. shrunk from a revolution. His popularity declined, and one day, when Papirius Carbo accused him in the Forum, the people responded with shouts of 'Down with the tyrant!' Next morning he was found dead in his room. Mommsen (*Röm. Gesch.*) says of him: 'The history of Rome presents various men of greater genius than Scipio Æmilianus, but none equalling him in moral purity, in the utter absence of political selfishness, in generous love of his country, and none, perhaps, to whom destiny has assigned a more tragic part.'

Scire Facias, in English law, is a writ to enforce the execution of judgments, patents, or matters of record; or to vacate, quash, or annul them.

Scirpus is a genus of leafy or leafless, usually tall, marsh or water plants, with creeping rootstocks, belonging to the natural order *Cyperaceæ*. The spikelets are several, in terminal or lateral cymes, heads, or clusters; the glumes imbricate all round the rachis; the flowers hermaphrodite; the perianth of six or fewer short bristles; the stamens three; the style two to three cleft, not swollen at the base, deciduous; and the fruit compressed or three-angled. S. consists of upwards of fifty species, met with in all climates. The Bulrush (q. v.) is the most useful representative of the genus.

Sciuridæ. See SQUIRREL.

Sclerobasic Coral (from Gr. *sklēros*, 'hard,' and *basis*, a 'base'), the name given to corals, of which the Red coral (*Co. allium rubrum*), the *Isis* or Mare's-tail coral, the *Gorgonias*, &c., are good examples, and in which the living polypes are situated on the *outside* of the coral substance. These polypes, as a rule, belong to the order *Alcyonaria* (q. v.) of the *Calciferata* group, and have eight fringed tentacles. The S. C. varies in composition. It may be hard and limy, as in Red coral, or horny as in *Gorgonias*, or partly limy and partly horny as in *Isis*. Although the S. C. is situated within the animal tissues which form it, it is in reality placed *external* to the bodies of the animals which coat it. The S. C. is formed by the *bases* or lower portions of the polypes, and is not secreted by their internal parts as in the opposite or *sclerodermic* coral. The latter is secreted within the bodies of the polypes; it exists outside the living parts, and exhibits distinct cups or *calyces* in which the soft parts are protected. These cups are wanting in the S. C. The *Sclerodermic forms* are the reef-building corals.

Sclerodermi (from Gr. *sklēros*, 'hard,' and *derma*, 'hide,' or 'skin'), a family of *Teleostean* fishes included in the sub-order *Plectognathi* (q. v.). The snout is conical, and the mouth is toothed in front of the snout. The body is invested in an armour of hard scales. To this group belong the *Ostracions* and *Balistes*—the Trunk and File fishes.

Sclerodermic Coral. See SCLEROBASIC CORAL.

Scleros'toma (from Gr. *sklēros*, 'hard,' and *stoma*, 'mouth'), a parasitic genus of Worms (*Stolida*), of which one species, *S. syngamus*, causes the disease known as the 'gapes' in poultry. The symptoms of this disorder consist in the bird gaping, sneezing, gasping for breath, and otherwise indicating that some obstruction of the air-passage is present. Other species of this genus occur in horses and pigs. *S. armatum* occur in the intestines, arteries, and in other situations in the horse. *S. tetrachantum* occurs in the cœcum and colon of the horse, and *S. dentatum* is found in the cœcum and colon of the pig. Cobbold says that the females of the S. of the fowl measure $\frac{3}{16}$ of an inch in length, the males measuring $\frac{1}{4}$ inch.

The young are supposed to pass the primary stages of development within an insect-host. For the successful removal of these worms from fowls it is necessary to pass a feather denuded of web save at its tip into the windpipe, and by twisting it round to extract the worms. The feather may be dipped in a weak solution of tobacco, whilst by some the simple application of turpentine to the throat of the bird is considered to be a sufficient remedy. An opening into the windpipe is necessary when the disease has proceeded to an extreme extent. All observers agree in strongly recommending the thorough destruction of the parasites after removal. If they are merely thrown on the ground, the eggs may become distributed far and wide, and may thus cause fresh infection.

Sclero'tium (from Gr. *sklēros*, 'hard') is a spurious genus of *Fungi*, the strange forms referred to it consisting (as implied by the name) of a mass of cells compacted into irregular tuberous bodies. They are either entirely free, or more or less imbedded in the substances on which they grow. They are found on decaying agarics, on herbaceous stems, rotten wood, amongst moss or dung, on putrefying roots or fruit, or even on decomposed animal matter.

Scole'cida, an important division of the animal kingdom, including those animals known as parasitic worms, but which are removed by their structure from the true worms or *Annelida* (q. v.). The exact zoological position of the S. is still a matter of dispute. By many zoologists they are placed as one of the two divisions of the sub-kingdom *Echinozoa* (q. v.) or *Annulocida*; while others regard the S. as more properly forming a section of the lower *Annulosa* under the heading *Vermes* or worms. The characters of the S. are derived from the usual absence of lime in their integument, and from the possession of a *water-vascular system*. The nervous system consists of one or two ganglia, closely situated together. In this heterogeneous group are included the *Platyelmia* or flat worms; the *Nematelmia*, or round worms; and the *Kotifera* (q. v.) or wheel animalcules. The *Platyelmia* (q. v.) includes the *Tenida* (tapeworms); *Trematoda* (q. v.) (Flukes) and *Imbellaria*. The *Nematelmia* (q. v.) are represented by the *Nematoda*; *Gardiacea* (see *Gordius*); and *Acanthocephala* or 'thorn-headed' worms.

Scol'lex. See TAPEWORM.

Scolopa'cidæ, the Snipe family, a large group of *Grallatorial* or Wading birds, including a large number of subdivisions. The characters of this important group are (1) a long, slender, and compressed bill, grooved to the tip; (2) nostrils placed in a groove at its base, and closed by membrane; (3) the shortness or absence of the hinder toe. The wings are long and pointed. The chief sub-families regarded by most naturalists as being included in this group are the *Limosina*, *Totantina*, *Tringina* (see SANDPIPER), *Scolopacina* (see SNIPE), and *Phalaropodina*.

Scolopen'dra. See CENTIPEDE.

Scolopen'drium. See HART'S TONGUE.

Scoly'tus, a genus of beetles, the type of a family *Scolytidae*, often known as the 'wood-borers.' The body is long, cylindrical, and truncated at either extremity. The colour is black or brown. These beetles excavate mines under the bark of trees, and generally attack trees of advanced age. *S. destructor* ravages old elm-trees. Other genera are *Xyloterus*, *Tomicus*, and *Hylurgus*. *T. monographus* is famous for its power of drilling holes in malt-liquor casks in India. The eggs are deposited in the bark of the trees. The affected bark should be taken off the trees, and the larvæ exposed to the attack of birds.

Scomberesoc'idæ, a group of *Teleostean* fishes represented by the Saury Pike (*Scomberesox*) and other genera, and forming a division of the *Platognathi* (q. v.). They are recognised by the premaxillary and maxillary bones united at the sides of the mouth.

Scomber'idæ, the Mackerel family, a group of *Teleostean* fishes, in which the body is of ovate and compressed shape, and the scales usually minute or invisible. The fins are well-developed, and the *pectorals* are usually long, narrow, and pointed. There are usually two dorsal fins, the first being spinous and long; the tail fin is generally forked. In this large group are included the John Dory (*Zeus faber*), the Boar-fish (*Capros aper*),

the Opah-fish (*Lampris*), the Scad (q. v.), the Centrolophus or Black-fish, the Pilot-fish (q. v.), the Sword-fish (q. v.), the Mackerel (q. v.) the Tunny, &c. All the S. are marine in habits. Many are excellent food fishes; e.g., the mackerel and tunny. The majority inhabit warm seas.

Scone (pron. *Scoon*), a village of Perthshire, Scotland, on the Tay, is 2 miles by rail N. of Perth. It is called *regalis civitas* as early as the beginning of the 10th c. An abbey was founded here by Alexander I. (1115), in place of an older monastery, and here too was kept the stone, said to have been brought from Iona in 834, on which the Scottish kings were crowned till Edward I. carried it to Westminster. S., however, was used as the place of coronation by Robert the Bruce and many of the Stuarts till Charles II., who was crowned here in 1651. The ancient abbey was destroyed in 1559. The neighbouring palace of S. is a residence of the Earls of Mansfield. Pop. (1871) of parish, 1914.

Sco'pas, a Greek architect and sculptor of the late Attic school, was born at Paros towards the close of the 5th c. B.C. He designed the temple of Athena at Tegea, and produced some of the sculptures on it. He also shared in the building of the temple of Artemis at Ephesus, and was the sculptor of several friezes on the Mausoleum. In sculpture proper his greatest work was the group in which Neptune, Thetis, and the Nereids conduct Achilles to Leuce. In Pliny's time this group stood in Rome, where also was his splendid representation of the destruction of Niobe's children. Some portions of this latter are now in the Florence Gallery. S. also produced a Pythean Apollo, a Dionysus, and several Venuses. Like Praxiteles (q. v.), with whom he is associated in the foundation of the later Attic school, he had much greater freedom and a keener appreciation of beauty than the earlier school, but his art was extremely sensuous, and contained the germs of decay.

Score, in music (Ger. *partitur*, Ital. *partizione*, Fr. *partition*), a copy of a composition in which each part is separately shown. Printers of music call two or more lines of music united by a brace a S., and from this practice of marking or scoring the work is derived. Every musician, or at least every composer, ought to be able to read a S. at sight. In part-songs and vocal compositions generally the S. may be written on two staves; but where counterpoint is introduced and the parts frequently cross, a fuller S. is required. A complete vocal and instrumental S. allows one staff for each part, excepting the violoncello and double bass and the parts for two wind instruments, for which one staff is sometimes sufficient, the tails of the notes for one instrument being turned upwards, and those for the other downwards. Modern composers have adopted different plans of grouping instruments in writing their scores, but the following gives an idea of the order which usually prevails:—

- | | |
|----------------------------------|---|
| 1. Wood wind-instruments. | 5. Stringed instruments (excepting bass). |
| 2. Soft-toned brass instruments. | 6. Voices |
| 3. Loud brass instruments. | 7. Bass stringed instruments. |
| 4. Instruments of percussion. | 8. Organ or pianoforte. |

Scoresby, William, D.D., F.R.S., an Arctic explorer, was born at Cropton, Yorkshire, October 5, 1789. His father, Captain Wm. S. (born 1760, died 1829), was a most successful whale-fisher, and the inventor of the round top-gallant crow's-nest. While studying at Edinburgh University young S. frequently accompanied his father to the northern whale-fisheries, and became chief mate when only sixteen years of age. In 1806 he reached the highest latitude which had then been attained, 81° 30'. In 1811 he became captain, and made numerous voyages to the northern seas, a valuable and interesting record of which he published in his *Account of the Arctic Regions* (2 vols. 1820). In 1822, in the ship *Baffin*, he explored the eastern coast of Greenland, a completely new field of discovery, and gave his results in his *Journal of a Voyage to the Northern Whale Fishery* (1823). He then determined to enter the Church, and with this end in view passed through a complete course of divinity at Queen's College, Cambridge. In 1829 he was presented to the vicarage of Bradford, Yorkshire. His scientific career, however, did not cease, for he continued to devote great attention to magnetic phenomena, and undertook voyages to the United States (1847) and to Australia (1855-56) in prosecution of his researches. These he submitted in reports to the British Association; and published besides a valuable work entitled *Magnetical Investiga-*

tions (2 vols. 1839-48), which contains most of his individual labours in this direction. He was also the author of *Discourses to Seamen, Sabbaths in the Arctic Regions, &c.*, and of a Life of his father (1851). He died at Torquay, March 21, 1857. See *Life of William S.*, by his nephew, R. E. Scoresby-Jackson (Lond. 1861).

Scorise, volcanic ashes varying in colour from reddish-brown to black. In appearance they resemble the ordinary slags of iron furnaces, having been formed by cooling in much the same circumstances.

Scorpion (*Scorpio*), a genus of *Arachnida* forming the type of the family *Scorpionida*, and order *Pedipalpi* (*Arthrogastra*). The legs number four pairs (as in all *Arachnida*), but the *maxillary palpi*, or appendages of the lesser jaws, are very long, and are converted into *chela* or nipping-claws, which closely resemble limbs. The abdomen and post-abdomen are segmented, and the *telson*, or last joint of the tail, bears a poison-gland and sting. The tail consists of twelve segments, and the limbs are borne by the chest alone, the thorax being united with the head, and thus forming a single segment. No true antennæ or feelers are developed, but the mandibles or larger jaws may represent these appendages. The breathing organs exist in the form of lung sacs or pulmonary vesicles in the sides of the body, and to which air is admitted by apertures named *stigmata*. There are four pairs of these sacs in the S. The S. inhabits warm climates; its sting is dangerous under some circumstances, but not necessarily fatal. The European species (*Scorpio Europæus*) may attain a length of from three to five inches; its colour is dark brown.

The *Book-S.* is the name given to certain little *Arachnidans* removed in zoological position from the true S., and belonging to the family *Cheliferidae*. The *Chelifer Wideni* is a common species inhabiting old books, and feeding on flies and other insects. *Fossil scorpions* first appear in rocks of the Carboniferous age.

Scorpion-Fish, or **Sea Scorpion**, the name given to Teleostean fishes belonging to the *Triglida* or Gurnards. The red S.-F. (*Scorpena scrota*) is found on the British coasts, and in the Mediterranean Seas, where the spotted S.-F. (*S. porcus*) also occurs. The average length is from 12 to 18 inches.

Scorzonera is an extensive genus of the *Chionaceæ* tribe of *Compositæ*, of which the *S. hispanica* has long been cultivated as an esculent under the names of S. or Viper's grass. It is a native of Mid. and S. Europe and the East; is a yellow-flowered perennial, and is botanically allied to the Salsify (q.v.). The root, which in shape resembles a carrot, but is smaller and dark coloured while internally it is pure white, has been strongly recommended for its antilithic properties. The taste is sweet and agreeable, with a nut-like flavour. It is prepared by boiling and then peeling, and is usually eaten in the same way as asparagus. *S. delciosa*, a purple-flowered species, native of Sicily, is perhaps superior to the above, and *S. tuberosa* of the Volga district yields an edible root. Various Chinese, Persian, Siberian, Turkish, and N. African species might also be utilised.

Scot, Reginald, born in the first half of the 16th c., was educated at Oxford, and passed the greater portion of his life on his paternal estate of Scotshall in Kent. In 1574 he published *A Perfitte Platforme of a Hoppie Garden*, and in 1584 appeared his attack upon the popular superstitions of the day entitled *The Discoverie of Withecraft*. For the scepticism expressed in this book S. was subjected to much persecution, and James I., one of the authors who most bitterly assailed him, ordered all copies of the *Discoverie* to be burnt. S. died in 1599. In 1665 there was printed a third edition of the *Discoverie*, wherein to is added a *Discourse of the Nature and Substance of Devils and Spirits*.

Scoter (*Oidemia*), a genus of ducks represented by the Black S. (*O. nigra*), and by the Velvet S. (*O. fusca*). The common or black S. attains the size of a common duck. Its flesh is oily, but is largely used during Lent in Roman Catholic countries. The Velvet S. occurs in Orkney chiefly, while the black S. is found in S. Europe in winter. The latter bird is black, the female being of a dark-brown hue. The bill is short and broad, and bears a knob at the base of the upper mandible. The tail is short and acute, and the *lamina* or horny plates of the bill are well developed. The S. is also named the 'Surf duck.'

Scotia (Gr. *Skotia*, 'shadow or darkness'), a deep, hollow moulding, part of which is always in shade, generally used in bases. See MOULDINGS.

Scot'land, the country forming the northern and smaller portion of the island of Great Britain, extends from lat. 54° 38' to 58° 40' N. and from long. 1° 46' to 6° 14' W. It is bounded N. by the Pentland Firth, E. by the N. Sea, W. by the Atlantic, and S. by the Irish Sea, the Solway Firth, and by England, from which it is separated partly by the Tweed, partly by the Cheviots. Of an oblong and extremely irregular shape, the mainland is 285 miles in length from the Mull of Galloway, the most southerly, to Dunnet Head, the most northerly point. Its breadth varies greatly; from Buchan Ness in the E. to Ardnarmurchan in Argyllshire the distance is 160 miles; but from Dornoch Firth to Loch Broom, in the S. of Sutherlandshire, is only 24 miles. The E. coast is indented by deep wide inlets, chief of which are the Firth of Forth, Firth of Tay, Moray Firth, with its lesser reaches, Cromarty and Dornoch Firths, and Loch Beaulay. The word *firth* (Dan. and Nor. *fjord*), common on the E. coast, is a trace of the Scandinavian element which extends along the seaboard from the Forth northwards. Like that of Norway, the W. coast of S. is fretted by long, narrow arms of the sea, called lochs (comp. Irish *loughs*), and is fringed by island groups. Among the inlets are Loch Assynt in Sutherlandshire, Lochs Broom, Ewe, Torridon, and Aish in Ross-shire; Hourn, Nevish, and Moidart in Inverness-shire; Sunart, Linnhe, Fyne, and Long in Argyllshire. The larger islands in the W. are the Hebrides (q. v.), Skye (q. v.), Mull (q. v.), Jura (q. v.), and Islay (q. v.); Arran and Bute lie within the Firth of Clyde, and are sheltered from the Atlantic by the long peninsula of Cantire. The S. seaboard is indented by the Solway Firth, Wigton Bay, and Luce Bay, and runs out in two bold promontories, Burrow Head and the Mull of Galloway. Other notable headlands besides those mentioned are the Butt of Lewis, the N. point of the Hebrides; Cape Wrath, the most north-westerly, and Duncauby Head, the most north-easterly points of the mainland; Tarbet Ness, between the Dornoch and Moray Firths; Fife Ness; and St. Abb's Head in Berwickshire. Separated from Caithness in the extreme N. by the Pentland Firth, are the Orkney and Shetland Islands (q. v.). Including the large inlets, S. has a coastline of 2500 miles, or 1 mile of seaboard to 11 sq. miles of area, a proportion only equalled among European states by Greece. The areas and population of the thirty-two counties into which S. is divided are as follows, according to the census of 31st April 1871:—

Counties.	Area in Statute Acres.	Population.	Persons to the sq. mile.	Chief towns.
Aberdeen	1,260,625	244,603	124.18	Aberdeen
Argyle	2,083,126	75,679	23.25	Inveraray
Ayr	735,262	200,809	174.79	Ayr
Banff	439,219	64,023	90.38	Banff
Berwick	207,101	36,430	78.38	Greenlaw
Bute	143,997	16,977	75.46	Rothsay
Caithness	455,708	39,992	56.17	Wick
Clackmannan	31,876	23,747	476.78	Clackmannan
Dumbarton	172,677	58,857	218.14	Dumbarton
Dumfries	705,946	74,808	67.82	Dumfries
Edinburgh	234,026	328,179	894.59	Edinburgh
Elgin or Moray	340,000	43,612	80.69	Elgin
Fife	328,427	166,735	313.21	Cupar
Forfar	569,840	237,567	206.91	Forfar
Haddington	179,142	37,771	134.94	Haddington
Inverness	2,723,551	87,531	20.57	Inverness
Kincardine	248,284	34,630	89.27	Sonehaven
Kinross	49,812	7,198	92.48	Kinross
Kirkcudbright	610,343	41,851	43.89	Kirkcudbright
Lanark	568,868	765,339	861.04	Lanark
Linlithgow	81,114	49,095	323.22	Linlithgow
Nairn	137,500	10,225	47.60	Nairn
Orkney and Shetland	598,726	62,882	67.27	Kirkwall
Peebles	227,869	12,330	34.63	Peebles
Pert	1,664,690	127,768	40.17	Pert
Renfrew	162,428	216,947	854.82	Renfrew
Ross and Cromarty	2,016,375	80,955	25.70	Dingwall
Roxburgh	428,494	53,974	80.62	Roxburgh
Selkirk	166,524	14,005	51.83	Selkirk
Stirling	298,579	98,218	210.53	Stirling
Sutherland	1,207,188	24,317	12.89	Dornoch
Wigtown	327,906	38,830	75.79	Wigtown
	19,496,132	3,360,018	110.30	

The average pop. to the sq. mile is thus 110.30, while that of

England is 389, and that of Ireland 166. Edinburgh is the capital of S., and Glasgow, with a pop. (1877) of 555,933, is its chief commercial city. The pop. of S. had increased to 3,593,929, according to the Registrar-General's returns for 1878.

Physical Aspect.—For the most part mountainous, S. has many extensive level tracks of great fertility. It is divided roughly into the Highlands and Lowlands. Peculiarly the 'land of the mountain and the flood,' the first is a wild region of grand metamorphic ridges and peaks, of lonely glens and upland lakes, and of far-stretching tracts of heath and moor. The pastoral Lowlands are not, as the name might imply, entirely level, but are diversified by hill and dale and fertile holme, by grassy fells, highly-cultivated plains, and umbrageous 'dens.' Where the Highlands and Lowlands meet, in many parts of Perthshire as well as in the far-famed Loch Katrine district, the richest natural effects result from the blending of the savage majesty of the one with the soft, sylvan beauty of the other. Loch Lomond clasps the two regions together; its N. end is girdled by rugged heather hills, while its S. extremity, studded with fairy islets, is essentially Lowland. The distinction between Highlands and Lowlands by no means corresponds to that between N. and S.; the island of Arran, though wholly S. of Berwick-on-Tweed, is yet in the Highlands, while Caithness, the most northerly county, is for the most part lowland country. Thus, too, the whole W. coast, from the Mull of Cantire to Cape Wrath, is in the Highlands, the mountains not only reaching to the sea, but overspreading the islands; whereas the E. coast to the N. of Aberdeen as far as Tarbet Ness is low and sandy. From Aberdeen S. as far as Arbroath, the seaward offsets of the Grampians form a high, rocky shore. The Grampians (q. v.) may be said to divide the two sections of S., but the Highlands include those districts into which the great mountain-chain sends its spurs. Ben Nevis (q. v.), the highest mountain in the British Isles, has an altitude of 4406 feet. Another Grampian summit, well-known through its rock crystals, is Cairngorm, 4083 feet, the corner-stone, so to speak, of the counties of Aberdeen, Inverness, and Banff. The wildest and highest part of the Grampian ranges is near the head-waters of the Dee, where Ben Muichdhuil rises to 4295 feet. Other celebrated summits are Braeriach, 4265 feet, Cairntoul, 4245, and Lochnagar, 3770, in Aberdeen; Ben Lawers, 3984, Ben More, 3843, and Schiehallion, 3547, in Perth; Ben Cruachan, 3693, in Argyll, and Ben Lomond, 3192, in Stirling. The Grampians bound Perthshire on the N., and on its S. border is the low range of the Sidlaw Hills, and the Ochils, prolonged in the Campsie Fells, in Stirlingshire. The Lammermoors and Pentland Hills confine the Forth basin on the S.; the Moorfoot Hills are a continuation of the former, and Tinto (2308 feet), in Lanarkshire, an outlying peak of the latter. In the 'south country' are the Eildon Hills, the Moffat Hills, the Lowthers, and the Cheviots (q. v.). The Highlands are divided equally into two by Glenmore ('great glen'), a deep gorge about 100 miles long, traversed by the Caledonian Canal, which consists of the long narrow Lochs Ness and Lochy, connected by artificial cuttings with each other and with Moray Firth, and with the Atlantic through Loch Linnhe. To the S. of the Grampians lies Strathmore, i.e. 'the great valley,' the greatest in S., stretching for 100 miles through the counties of Perth, Forfar, and Kincardine, with a breadth of from 5 to 10 miles. Lesser plains are the Howe of the Mearns (Kincardine), the Carse of Stirling, immediately S. of the Ochils, and Carse of Gowrie in Perthshire. Even the largest rivers of S. are navigable only for a short distance; the Clyde (q. v.) only to Glasgow, the Forth (q. v.) to Stirling, and the Tay (q. v.) to Perth. The last mentioned is the longest in S., with a course of 126 miles. Other notable streams are the Tweed, Spey, Dee, Don, Deveron, Findhorn, N. and S. Esk, and Nith. Of the numerous lakes of S., the largest and finest is Loch Lomond (q. v.), the most romantic, Loch Katrine (q. v.), the grandest, Loch Marce (q. v.), while Loch Awe (q. v.) blends sublimity and beauty in exquisite harmony.

Geology.—As on the eastern shores of N. America, the so-called Laurentian or fundamental gneiss appears on the W. coast of S. as the basis of the stratified rocks. It overspreads the whole extent of the outer Hebrides and the western parts of Sutherlandshire, and occurs in patches elsewhere in the W., in all cases maintaining a steady N.E. dip. Cambrian rocks are represented by a considerable series of unfossiliferous red and purple sandstones and conglomerates, well displayed in the W. of Ross-shire. The whole area of central S. as far S. as the

Forth or Clyde is occupied by an immense mass of highly metamorphosed strata, still dipping towards the N.E. Fossils are exceedingly rare, having as yet been detected only at Durness. At Easdale, Ballachulish, &c., rocks of this formation exhibit the perfect cleavage of fine slates. The granite of Aberdeenshire, &c., is synchronous with rocks of this period. Southwards from a line joining Girvan and Dunbar is a wide stretch of Middle Silurian strata. It consists chiefly of a series of greywackes and dark shales, the latter yielding very numerous graptolites, which have afforded Mr. Lapworth a basis for the correlation and classification of the order. True Upper Silurian strata occur in various limited areas, notably in the neighbourhood of Lesmahagow. The Lower Old Red Sandstone forms a triangle, having a broad base on the coast of Forfarshire, and its apex near Helensburgh, on the Clyde. In Roxburgh, Berwickshire, and the adjacent counties, a considerable area is occupied by the Upper Old Red, which, however, is more typically developed and richer in organic remains in Orkney and Caithness, and on the southern shores of the Moray Firth. The great coal-producing district has its limits at St. Andrews and Dunbar on the E. coast, and at Ardrrossan and Dumbarton on the W., the most valuable portion being the field of Lanarkshire. Here the manufacture of paraffin, and other products of the distillation of shale, has now become an industry of great importance. The Reptiliferous sandstones of Elgin are probably of Triassic age, while patches of Jurassic and Cretaceous rocks are dotted over both sides of northern S. Leaf-beds, &c., of the Miocene period, were discovered by the Duke of Argyll in Mull, while glacial clays, with interesting fossils of an Arctic type, occur in the estuaries of the Forth and Clyde. Permian rocks occur in Dumfriesshire.

Climate and Agriculture.—The climate is very variable, but owing to its seaward exposure neither cold nor heat is so extreme as in similar continental latitudes. As registered at Castle Newe, in Aberdeenshire, 912 feet above the sea, and 35 miles inland, for a period of 34 years ending 1866, the mean temperature in January is 33°597, and in August 58°401. The mean annual rainfall is 35 inches. The winds are more variable than in England, and more violent, especially about the equinoxes. Westerly winds prevail during autumn and early winter, but E. and N.E. winds are felt severely in spring. While three-fourths of England are under cultivation, only one-fourth of S. is arable, but this is due to inferiority of climate and soil, for the Scotch have acquired the highest reputation as agriculturalists. In 1878 the arable land in S. was 3,537,000 acres, while 252,000 acres have been reclaimed (partly for pasture) since 1869. Of the acreage under corn crops (1878) as much as 41·8 per cent. was in wheat in England, as against 20·7 in Wales, and only 5·4 in S.; but S. had 73·8 per cent. in oats, while England had only 19·7, and Wales 47·8. After three unusually bad harvests, that of 1878 was exceptionally good (with excellent grain and hay crops), amounting in value to not less than 5 millions sterling. In 1878 there were 1,400,967 acres under corn crops, 687,319 under grass crops, 1,153,515 in permanent pasture, and 1,431,524 in clover, sainfoin, and grasses in rotation. S. had, in 1878, 1,095,387 cattle, 7,036,396 sheep, 140,189 pigs, and 191,416 horses. The sheep and cattle are chiefly reared in the Highlands, and after changing hands at the Falkirk trysts and other fairs are fattened on the turnips and grain of the Lowlands, and are consumed in the towns or sent to English markets.

Industries, &c.—Glasgow and Paisley are the principal seats of the cotton trade (105 factories with 36,104 hands in 1876), Dundee and other Forfar towns are noted for their jute and coarse linens (84 factories, 30,893 hands). Tweeds, tartans, and carpets are extensively manufactured at Galashiels, Hawick, Selkirk, Jedburgh, Bannockburn, Kilmarnock, and Aberdeen, floor-cloth at Kirkcaldy, and damasks and fine linens at Dunfermline. In 1876 there were 257 factories for woollens with 27,728 hands, 43 for worsted with 10,255, 159 for flax with 45,816, 12 for hemp with 1831, 4 for silks with 740, and 8 for hosiery with 1110. These textile industries thus employed 44,269 males and 110,650 females. In the counties of Lanark and Ayr, and at Carron in Stirlingshire, are some of the largest iron-works in the kingdom. In 1877, 982,000 tons of pig-iron were produced, and the average number of furnaces in blast was 117. The yield of coal in 1877 from 420 pits amounted to 18,665,552 tons, while the production of lead ore was 3207 tons, of silver (at Alva, Stirling), 10,720 oz., and of copper ore, 680 tons. There are large

slate quarries in the counties of Aberdeen, Argyle, Perth, and Peebles. Marble is found in Argyle, Sutherland, and the Hebrides; granite in the Grampians; and sandstone throughout the country. Scotch pebbles are a specialty, and pearls are fished in the Teith, Forth, and Tay. The Clyde ports are world-famed for the construction of steam vessels. Shipbuilding is also carried on to some extent at Aberdeen, Dundee, Grangemouth, &c. The total number of registered sailing vessels (1877) was 2542 (885,442 tons), and of steam vessels 902 (451,635 tons). S. has valuable river and deep-sea fisheries (herring, haddock, cod, ling, &c.). In 1877 the total quantity of herrings cured was 847,718 barrels, while 561,985 barrels were exported. There were 14,623 fishing-boats (value £1,178,000) and 45,890 men and boys employed in 1877. In 1877 the exports of S. amounted to £15,163,608, the imports to £36,772,897, and the customs to £1,782,683. In 1877 there were 2726 miles of railway lines, and the total paid-up capital was £82,717,408. In 1876 the number of Scotch emigrants was 10,097—the total that left Scotch ports, 12,769.

Religion and Education.—For an account of the prevailing religion, see the section of this article devoted to Ecclesiastical History, FREE CHURCH OF SCOTLAND, and UNITED PRESBYTERIANS. In 1878 there were 320,000 Roman Catholics, 73,200 Episcopalians, comprising many of the nobility. The parish school system under which S. became celebrated for the general diffusion of education gave place in 1872 to a national system under school-boards, similar to that established in England by the Act of 1871. (See PUBLIC SCHOOL SYSTEM OF THE UNITED KINGDOM.) S. has four universities, at St. Andrews (founded 1410), Glasgow (1450), at Aberdeen (1494), at Edinburgh (1552). Besides the university medical degree, licenses are issued by the Royal College of Physicians, Edinburgh (incorporated 1681), the Royal College of Surgeons, Edinburgh (1505), and the Faculty of Physicians and Surgeons of Glasgow (1592). Academies of art exist at Edinburgh and Glasgow.

Law.—The law of S. differs from that of England, resting largely on the Roman or Civil law. Its chief features are the subject of special notice throughout this work. The highest tribunal in the country is called the Court of Session (q. v.), but from its decisions there lies an appeal to the House of Lords. It is popularly known as the 'Parliament House,' a name which preserves a memory of the time when S. was a separate kingdom and possessed a Parliament of its own. Previous to the Act 36 and 37 Vict. c. 63 (1873), no 'law-agent' could conduct a case before this Court unless he were qualified as a W.S. ('Writer to the Signet') or S.S.C. ('Solicitor to the Supreme Court'). Hence legal business in the highest Scotch courts was exclusively carried on by a distinct class of law-agents or solicitors resident in Edinburgh, whom provincial law-agents, commonly termed procurators, required to engage for this purpose. By the Act of 1873, however, one body of 'law agents' was instituted for all Scotland, the then existing Edinburgh and provincial practitioners being entitled to have their names placed upon the new register of such agents. Inferior courts known as sheriff-courts (see SHERIFF) are established in every county. The barristers who act as Counsel of Agents in the Supreme Court are called Advocates (see ADVOCATES, FACULTY OF).

Civil History of S.—The early history of the Scottish nation is of a semi-mythical nature which almost precludes a faithful record. At the time (A.D. 80) when the Romans under Julius Agricola vainly attempted to subjugate the northern part of Great Britain, there can be no doubt that the dominating tribe was that of the Picts (q. v.); the Scots, properly so called, came first from Ireland, about the beginning of the 6th c. under the leadership of Fergus MacEic, and established the Dalriadic kingdom (see DALRIADA) in Argyle and the adjacent Western Islands, but although they brought with them a divine religion and the agencies of culture, they did not finally establish their ascendancy until the middle of the 9th c., when Kenneth MacAlpine united the sovereignty of the two races in his own person (A.D. 843). The century that elapsed from Kenneth to Constantine II. is chiefly marked by the ravages and conquests of the Norsemen, and the extension of the Scottish power S. of the Forth, but it lies deeply in shadow, in spite of the profound and critical labours of Skene (q. v.). The 11th c. is the true dawn of Scottish history. After the fall of Macbeth (q. v.) there is at least a certain amount of continuity

in the historic record. The reign of Malcolm (q. v.) Ceanmohr witnessed the beginning of a silent but all-important revolution. Hitherto S. had been a purely Celtic kingdom, in language, laws, religion, and race. By Malcolm's marriage with an English princess, Margaret (q. v.), sister of Eadgar (q. v.) the Ætheling, a Teutonic element was introduced which was immensely strengthened by one of the political effects of the Norman Conquest, viz., the immigration of those Englishmen into S. who could not brook a Norman master. From the time of Malcolm English became the language of the court, and gradually spread over the S. and E. of the country. In spite of race, the happy accident of Malcolm's marriage delivered Scotland from the fatal supremacy of *Celticism*, and thus, in spite of long-continued national animosities, the union of two nations at last became both easy and natural. The Anglicising of S. went on vigorously under Malcolm's sons, all of whom, but notably David I. (q. v.), inherited the religious spirit and civilising instincts of their sainted mother. The great events of the first half of the 12th c. were the renewal of the efforts of the Norsemen, and their conquest of the Orkneys, the unavailing insurrections of the Celtic clans in the N. against the English policy of the kings, and the complete subjugation of the Celts of Galloway. William (q. v.) the Lion, grandson of David I., is a notable figure in Scottish history. His capture at Alnwick (1174), his imprisonment at Falaise, his restoration to freedom on signing the Convention which acknowledged the ancient claim of England to the overlordship of S., and the renunciation of the claim by Richard I. on the eve of the Third Crusade, are to Scottish schoolboys perhaps the most familiar incidents of the 12th c. The reign of Alexander III. (q. v.) was long remembered as one of great prosperity and renown. During the dark days that followed it was looked back to as a kind of 'golden age.' The Norsemen now made their last descent, which ended in their utter defeat at Largs (A.D. 1263); and in 1281 the king's only daughter Margaret married the Norwegian heir to the throne, Eric, but died after two years, leaving an only daughter of her own name, who became heir to the Scottish throne. The death of Alexander (1286) and of the Maiden of Norway (1290) closed, however, the direct line of William the Lion, and opened the Scottish throne to the ambition of rival nobles. The claims of four, John Balliol, grandson of his daughter Margaret; Robert Bruce, son of Isabella; John Hastings, son of Ada and Florence, Count of Holland, whose pretensions were but small, were referred to Edward I. of England, who, in a council held at Norham (A.D. 1291), decided in favour of the first-named, though the actual judgment was not given till a year later. John Balliol (q. v.) proved a failure, and, after wearing the crown for a few years, was dethroned by Edward, and died in retirement in Picardy. S. now fell entirely under English rule, until its marvellous resurrection under the auspices of William Wallace (q. v.). The revolt which he headed was signalled by the brilliant success at Stirling and the crushing defeat at Falkirk. After Wallace's execution (1305), Edward again attempted a union of the two kingdoms, but the policy of 'independence' was immediately taken up by Robert Bruce (q. v.), grandson of the original claimant of the throne; its triumph was completed by the glorious victory of Bannockburn, which freed S. for ever from the violent dominion of a foreign power. Edward II. was forced to come to terms. After his death a lasting peace was confirmed by the Treaty of Northampton, and Robert I. recognised as King of Scots. In his reign the succession to the crown was definitely settled, and the Third Estate was recognised as a necessary part of the national assembly. When he died in 1329, his only son and successor, David II. (q. v.), was eight years old. David was the first anointed king of S. The 14th c. is chiefly occupied with struggles on the part of Scotland to fortify its liberties, and on the part of England to reassert its claims of lordship. Happily for the former country, the great war that broke out between England and France made it impossible for Edward III. to devote himself to the subjugation of the Scots; and not even the defeat, capture, and long imprisonment of the son of Bruce could restore the earlier vassalage. The reign of David is the beginning of those French alliances which in the long run did no good to Scotland. The most notable battles of the century were those of Dupplin, Halidon Hill, Neville's Cross, and Otterburn. The successor of David Bruce, Robert II. (q. v.), was the first of the famous and unfortunate house of Stewart (q. v.). His reign was marked

by almost constant Border strife, and the slopes of the Cheviots continually re-echoed the war-shouts of a Douglas and a Percy. The physical and mental weakness of Robert III. rendered a lieutenant necessary in the person of his son David, Duke of Rothesay, but the supreme power was virtually in the hands of his brothers, the Duke of Albany and the Earl of Buchan, by the former of whom the heir-apparent was imprisoned and starved to death in Falkland Castle, when Albany became governor. Scott's *Fair Maid of Perth* has given us a vivid picture of this time, and every one remembers the deadly battle between the clans Chattan and Kay, which took place in 1396 on the North Inch of Perth. In 1400 Henry IV. of England made an ineffectual invasion, with the idea of reasserting the English supremacy. The 15th c. opens with the defeat and capture of Douglas at Homildon (1402), and three years later James, Earl of Carrick, heir to the Scottish throne, was captured by the English while on his way to France; his father died in the following year, and Albany remained Regent until his death in 1419. By far the most important incident of Albany's regency was the defeat, at the 'sair field o' Harlaw' (1411), of the last great effort of the Celt to regain ascendancy in Scottish politics. The return of James I. (q. v.) in 1424, after a captivity of nineteen years, was marked by a vigorous and effective exercise of kingly justice, especially in the Highlands, which were a prey to anarchy, savagery, and every form of brutal license; but his efforts were prematurely interrupted by his murder at Perth, in 1436, by a band of disaffected nobles. The great misfortune of Scotland in the 15th c. was a succession of royal minorities. James II. (q. v.) was only six years old at his father's death, and during the young king's minority there was a constant dispute for his guardianship between the chancellors Crichton and Livingstone, respective governors of Edinburgh and Stirling castles. The House of Douglas increased in power and arrogance, notwithstanding the murder, in Edinburgh Castle, of the earl and his brother, until James II. attained his majority. Shortly after, the murder of the then Earl of Douglas in Stirling Castle, by the king's own hand, gave rise to a civil war, which ended in the ruin of this great house. When the Wars of the Roses broke out, King James espoused the Lancastrian cause; but his attention being diverted to a meditated recovery of his lost Scottish fortresses, he was killed by the bursting of a cannon whilst besieging Roxburgh (A.D. 1460). James III. (q. v.) was eight years old when his father was killed. The influence of French art becomes visible in the architecture of this period, but the peaceful and timid character of the monarch invited the barons to engage in turbulent enterprises against each other, to form leagues of mutual defence against the Crown, and finally drove them to revolt. The death of James at the field of Sauchieburn (1488) was the culmination of their assault on the royal authority and the national prosperity. It is interesting to note that in this miserable struggle the 'merchants, burgesses, and unlanded men' were on the side of the king; but the Scottish 'democracy' was still in its infancy, and could give him no effectual help. James IV.'s (q. v.) reign was one of the best in Scottish history, though it is chiefly remembered by the fatal disaster of Flodden. He set his nobles to keep their territories in order, chastised the pirates of the Western Isles, fostered trade, was the first patron of printing in Scotland, built famous ships, and encouraged boroughs to transfer their allegiance from the nobles to himself. Even the dismal day of Flodden—one of the worst outcomes of the 'French alliance'—was not without its compensations. Like the Wars of the Roses in the sister-country, it gave a death-blow to Feudalism. James V. (q. v.) was an infant at the time of his father's death, and when his mother married the Earl of Angus within a year, his cousin the Duke of Albany was made regent. He was unpopular, and on his departure for France in the king's twelfth year, it was arranged, through English influence, that James should be elected to reign (A.D. 1524). He chose as his guardian the Earl of Angus, who proved such a tyrant that the young king fled from him by stealth, and revenged himself by destroying the Douglas family. The borderers were brought into subjection in this reign. War broke out with England, partly connected with the old claim of supremacy, and partly with the Reformation schemes of Henry VIII. It ended with the defeat of the Scottish army at Solway Moss, and the king died of grief soon after hearing of the birth of his only daughter Mary (q. v.) (A.D. 1542). The regent was the Earl of Arran,

and his objection to English attempts on the Scottish crown led to an invasion in 1544 which met with slight resistance; a second, shortly after, was, like the first, chiefly devoted to pillage, and a third ended with the terrible defeat at Pinkie, 10th September 1547, after which the English were, by French assistance, driven out. The young queen was married in 1558 to François, Dauphin of France, who became king in the following year. The Reformation in Scotland may be said to date from the murder (A.D. 1545) of Cardinal Beaton, in revenge for the burning of George Wishart. In 1557 the First Covenant was signed, and religious uproars followed, in which John Knox came to the front. The insurgents effected a treaty at Berwick with Elizabeth of England in 1560, shortly after which the queen-regent died, upon which the Estates formally approved the Geneva Confession of Faith. In the following year Mary returned a widow, and was a second time married (29th July 1565), to her cousin Henry Stewart, Lord Darnley (q. v.), although her half-brother, the Earl of Murray (q. v.), tried forcibly to hinder it. The murder of David Rizzio (q. v.), her secretary, finally disgusted Mary with her husband, who was murdered at Kirk o' Field, 9th February 1567. The subsequent events of her romantic and tragic career are world-known: her abduction by Bothwell, her marriage to the suspected murderer of her late husband, her surrender at Carberry, imprisonment in Lochleven, escape, defeat at Langside, and fatal refuge in England, where she found a prison instead of a shelter, till she was finally put to death at Fotheringhay, 8th February 1587. The Regent Murray was murdered at Linlithgow in 1570, and was succeeded by Lennox, who died from wounds received in a scuffle with the Queen's party during the parliament of Stirling (A.D. 1571); the Earl of Mar followed as governor and restored Episcopacy, but lived little more than a year, and the Earl of Morton became Regent, 24th November 1572. On the same day died John Knox. The new ruler gained possession of Edinburgh Castle with English aid, and became nearly absolute; but in March 1578 James VI. assumed the government, and shortly after Morton was brought to trial and beheaded for the murder of Darnley. The young king was taken prisoner by the nobles under the Earl of Gowrie, in the Raid of Ruthven, 22d August 1581, and forced to acknowledge their acts, but escaped a year later, and revenged himself summarily. In May 1590 he was married to Anne, daughter of Frederick II., King of Denmark, and two years later Episcopacy was again abolished, and Presbyterianism established under the General Assembly. Religious riots ensued, in which James gained his point. The Gowrie Plot occurred in August 1600, and yet remains a mystery. On the death of Elizabeth of England, the King of Scotland became her heir through his descent from Margaret, daughter of Henry VII. and wife of James IV., and his right being confirmed by the English Parliament, he entered London, 6th May 1603, since which time the two crowns have been united. With this union the separate history of Scotland comes to a close.

Ecclesiastical History of S. Christianity was introduced into Britain during the time of the Roman occupation; and the Church thus founded was a part of the Church of the Empire. Towards the end of the Roman occupation, Ninian (q. v.), a Christian missionary, is said to have introduced it among the Picts on the northern side of the Solway Firth, and, in fact, to have converted the whole of the southern Picts as far as the Grampians. From the time when the Romans left Britain (410) till about the middle of the 6th c. is a legendary period of Scottish Church history which has been filled up by Fordun (q. v.) and Hector Boece (q. v.) with narratives which, according to modern critics, are entirely unhistorical. Thus there seems to be no historical ground for supposing that St. Palladius (q. v.), who is brought by Fordun to Scotland (431), was ever in Scotland at all. St. Servanus, who, according to the same authority, was found by Palladius on his arrival in Scotia, lived in the 7th c. And the Culdees, who, according to Hector Boece, were the monks or presbyters who governed the Church in Scotland between the year 203, when the Scots were converted by Pope Victor I. and the coming of Palladius, are really never heard of till the beginning of the 8th c. But at the same time there are traces of a connection having existed during the 5th c. between the southern Picts and the Church in Ireland, in churches dedicated to Irish saints of the time.

Towards the end of the 5th c. a colony of Scots from Dalriada (the N.E. part of Ulster) settled in the W. of Scotland, where,

although for a time they prospered and spread, they kept their footing with difficulty till the arrival in 560 of Columba (q. v.), who saved them from their enemies, the northern Picts, by converting them to Christianity. According to Bede, the nation of the southern Picts had been converted by St. Ninian. Be that as it may, they were in a state of paganism in the middle of the 6th c., and till Christianity was introduced among them by Columba (584). The Columban Church, in short, spread over the whole of Scotland N. of the Forth. There it was met by the Church of St. Cuthbert (q. v.), whose abbey at Lindisfarne was to the N. of England and Lothian what Columba's monastery in Iona was to the N. of Scotland—the centre of ecclesiastical government and religious enterprise. Of the district of Strathclyde the local apostle was St. Kentigern (q. v.), the contemporary of Columba. Being essentially a mission from the Church in Ireland, the Columban resembled in every respect the Irish Church of this period. It was a monastic church, in which there was neither territorial Episcopacy nor Presbyterian parity. The bishops were superior to the presbyters, and had the exclusive right of discharging the ordinary episcopal functions; but at the same time, being under a monastic rule, they were subject to the abbot, who might happen to be only a presbyter.

During the next period of Scottish Church history—the 7th and 8th centuries—the important question is the controversy between the native Church and the Roman Church regarding the observance of Easter, the shape of the tonsure, &c. When the purely Christian festival of Easter (q. v.) was substituted in the early Church for the Jewish Passover (q. v.), great difficulty was experienced in adjusting the day of the week, or solar time, to the day of the month, or lunar time. The system adopted in the Western Church was to celebrate Easter on the Sunday between the fourteenth and the twentieth day of the moon first after the vernal equinox, calculated on a cycle of eighty-four years. But a change was made in 457, and in 525 the cycle of nineteen years was finally adopted: Easter to fall on the Sunday between the fifteenth and twenty-first day of the moon. Now this change took place at the time when the Church in Ireland was completely isolated, so that she held by the former system, and regarded the latter as an unwarrantable innovation. In 710 the king of the Picts issued a decree that the Catholic mode should be observed throughout his dominions; and as the Columban monks refused to comply with this decree, the whole of them were expelled from the kingdom (717).

At the time when the Columban Church was coming into collision with the Church of Rome in this manner, two influences were at work modifying the constitution of the Church itself. One of these was the introduction from the Church of Rome of a hierarchy of secular clergy, with bishops exercising jurisdiction over the monasteries, instead of being in subjection to the abbot, as in the Columban Church. The other was the rise of the so-called Culdees (q. v.) or anchorites (the name representing the Lat. *Deicola*, which was applied to Anchorites (q. v.), as specially God-worshippers), who are first heard of in Scotland after the expulsion of the Columban monks. When in the 9th c. they were brought under canonical rule, along with the secular clergy, the name of Culdees came to be almost synonymous with secular Canons (q. v.). An attempt was made by Kenneth mac Alpin, King of the Picts, to restore the Columban Church in his dominions; and for this purpose he founded an abbey at Dunkeld, and made the abbot the first Bishop of Fortrenn (i.e. the kingdom of the southern Picts), whose seat was transferred to Abernethy in 865. The seat of the bishop of the Scottish Church (a title which first occurs in the time of King Giric, 878–889), or Bishop of Alban, was transferred to St. Andrews about 908. After the battle of Carham (1018), when Lothian was ceded to Malcolm II., the churches in that district fell under the jurisdiction of the Bishop of St. Andrews as sole Bishop of Scotland.

An important influence was exercised on the Scottish Church by Margaret, the English queen of Malcolm Canmore (married 1069). The policy of Margaret, which was continued by the successors of Malcolm, was (1) to substitute a diocesan episcopacy for the old monastic jurisdiction; (2) to introduce religious orders; and (3) to absorb the Culdees into the Roman system by converting them from secular into regular canons. King Alexander (1107–1124) created two new bishoprics—Moray and Dunkeld; and his brother David, while yet Earl of Cumbria, reconstituted the bishopric of Glasgow (about 1115). When he

became king (David I.), he created three new bishoprics—Aberdeen, Ross, and Caithness; and towards the close of his reign other two—Dunblane and Brechin. Alexander and David also founded a large number of monasteries for the regular canons of St. Augustine and for Benedictine monks. And even more direct measures were taken for the extermination of the Culdees. Their revenues and right were bestowed upon the regular canons; and such was the pressure brought to bear upon them that this last remnant of the old Celtic Church was absorbed into the order of regular canons in the course of the 13th c.

The C. of S. was now completely assimilated to the Catholic Church in the rest of Europe. And previous to the Reformation the corruptions of the Church had grown to a greater height in Scotland than in any other nation within the pale of the Western Church. In the second quarter of the 16th c. several persons were put to death for heresy, that is, preaching against the errors of the Church: Patrick Hamilton (1528), George Wishart (1546), Adam Wallace (1550), and Walter Mill (1558). But the death of these men, with the exception of the last, did not produce any widespread excitement. The truth is, that the causes of the Reformation were of a more practical nature than anything connected with a corruption of doctrine or abuses in matters purely religious. First, there was the collision between the higher ecclesiastics and the nobility. For a time the latter had seen their property and power taken from them to enrich the clergy; and when a set of teachers arose who taught that the clergy had no right to the position and wealth they had assumed, the nobles were very willing to be convinced. By the poorer classes, the tithes and other dues exacted by the Church were felt to be a burden. In 1557 the first Covenant was signed—a document by which the leaders of the Protestant party—the Lords of the Congregation, as they were now called—bound themselves to co-operate with each other in maintaining and establishing the Word of God, and in enmity to the antichrists of the time. The *casus belli* was the burning of Walter Mill. The Lords of the Congregation laid a remonstrance before the Regent, who received it in such a conciliatory manner as to allay the excitement for a time. An ecclesiastical council, too, met in 1559, to consider certain suggestions for reform made by a body of gentlemen well affected to the Established Church. But such internal reforms came too slowly or too late. The Queen Regent at this time assumed an attitude of distinct hostility to the Reformers, and her persecutions helped to produce an outbreak of popular zeal in their favour at Perth. The symbols of idolatry were attacked by the mobs, and many of the religious houses destroyed. The Reformers now issued manifestoes expressing defiance of the Queen Regent, who attempted to crush the opposition to her authority by means of French troops. Distrusting her strength, however, she made promises, on the faith of which the Congregation dispersed from Perth, where they had organised a defence. These promises were almost immediately broken, and the consequence was a fresh accession of strength to the Reformers, who now took possession of St. Andrews. They were not only able to hold their own there against the royal army, but they marched on Edinburgh, and took it (June 29). They were unable to retain this position, but a treaty with England was made (January 1560); assistance, in the shape of an English fleet and army, sent to Scotland; and the French army withdrawn in March. The Estates being convened in August, a Confession of Faith embodying the principles of the Genevan Church was approved of; all previous Acts on religious matters repealed; the authority of the Pope abjured; the celebration of the Mass declared illegal; and (on the 25th) Calvinistic Protestantism established as the national religion. The first General Assembly of the Protestant C. of S. was held on the 20th December 1560.

But the victory of the Reformers was yet far from being complete. Under the influence of Mary a Catholic reaction began, and a dispute arose among the Protestants themselves. The clergy had adopted, besides the Confession of Faith, a Book of Discipline, which the laymen were unwilling to subscribe, because it proposed that, while the tithes went to the support of the ministers and the poor, the revenues of bishops, abbots, and cathedrals should go to the endowment of colleges and schools. This was not what Knox's coadjutors had worked for. The deposition of Mary was favourable to the Reformation. The Regent took a solemn oath to maintain the Reformation and abolish Popery. The General Assembly prepared a scheme providing

effectually for the security of the Protestant cause, which was confirmed by Parliament in 1567; and from this time the Protestant religion was firmly established, and the Reformation complete.

But after the death of Knox (1572) a new conflict began—between Presbyterianism and Episcopacy. The Regent Morton favoured the latter, because he hoped by means of the bishops to exercise a power over the Church which would contribute to the stability of the government; and the nobility favoured it because they hoped by means of the bishops to retain part of the plunder of the Church. Accordingly, by the Convention of Leith (1572) it was enacted that the titles of archbishop and bishop should be retained till the majority of the king. But as the bishops were to be chosen by the ministers, and subject to the authority of the General Assembly in spiritual matters, the anomaly was presented for a time of Episcopacy and Presbyterianism co-existing in the C. of S. On the accession of James (1578), the Second Book of Discipline, which is still the law of the Church, was at once drawn up and sanctioned by Parliament; and in 1580 an Act was passed abolishing Episcopacy. The National Covenant of Scotland, also enacted at this time, was intended as a test of orthodoxy in regard to prelacy. The outrage on the king called the Raid of Ruthven produced a great reaction, so much so that in 1584 three Acts of Parliament were passed in favour of Episcopacy. Yet in 1592 the Presbyterian party had so far regained their influence that they carried a measure through Parliament which has been called the great charter of the C. of S. It repealed the Act of 1584 giving the king power to commission bishops to regulate all ecclesiastical matters in their dioceses; it gave to the General Assembly the right of meeting once every year; and it defined the rights of patrons and church courts in regard to vacant charges.

On the accession of James to the throne of England (1603), he virtually suppressed the General Assembly by proroguing it repeatedly as soon as it had met; and at length, in 1606, a Parliament which met at Perth reinstated the bishops in their former dignities, erecting seventeen sees. In 1618 the General Assembly met at Perth, presided over by the Archbishop of St. Andrews, supported by the prelates and nobility, and passed five acts enforcing all those forms of worship which were most distasteful to the Presbyterians. Charles I. on his accession (1625) resolved to carry out his father's two great designs regarding the C. of S., viz., the restoration of Episcopacy, and the recovery of the Church lands and tithes. A liturgy and book of canons were now prepared by the Scottish bishops. To the former all public worship was ordered by royal proclamation to be conformed. By the latter Presbyterianism was completely subverted, and Episcopacy put in its place. When the attempt was made (July 23, 1637) to introduce the new services into public worship there was a riot in Edinburgh, and all Scotland was roused almost to insurrection. A covenant was prepared, based on that of 1580, which was signed by a great majority of the people. The king wished to carry matters with a high hand, but his Commissioner, finding the Covenanters too strong, offered to make great concessions. These concessions, however, were not thought sufficient by the General Assembly convened at Glasgow (November 1638), and when the Commissioner dissolved the Assembly the members proceeded to assert their independence of the crown, repealed all the Acts of Assembly since 1606, and deposed all the bishops.

When the Scottish army met that of Charles at Kelso, a treaty was signed (June 18, 1639), ratifying the promises made to the Assembly of 1638. In August the General Assembly again met and renewed the National Covenant, which was signed by the Royal Commissioner. The result of the Civil War, begun in 1640, was that, instead of Episcopacy being imposed on the C. of S., Presbyterianism was like to have been imposed on the Church of England. The Solemn League and Covenant (q. v.) was signed in 1643 by the people of Scotland all to a mere handful, and the Confession of Faith prepared by the Assembly of Divines (q. v.) at Westminster was ratified by the General Assembly (Edinburgh, August 4, 1647), and became henceforth the authorised Standard of the C. of S. In July 1653 the General Assembly was dissolved by Cromwell, and did not sit again for thirty-five years; but otherwise the C. of S. had peace during the time of the Commonwealth. On the Restoration of Charles II. (1660) Presbyterianism was overthrown. In 1662 bishops were again established, and an Act passed requiring all ministers inducted since 1649 to obtain presentations from the

patrons, and receive collation and admission from the bishops; by the application of which Act about 400 ministers were induced to resign their livings. On the Revolution (1688) Presbyterianism was again established. An act was passed in the Scottish Parliament (1690) by which the Westminster Confession of Faith and the Presbyterian Church government, which has remained the constitution of the C. of S. to the present day, were ratified and established, and lay patronage abolished. The king, however, desired that the episcopal clergy should be received into the Church on equal terms with the Presbyterians, and when the General Assembly demurred to this, authority for doing so was granted by an Act of Parliament, passed June 1693. This act was offensive to the high Presbyterians in its provisions, but most of all because it was considered to be an unwarrantable attempt on the part of the state to interfere in church affairs.

From the time of Queen Anne the burning question in the C. of S. has been Patronage (q. v.), the cause of almost all the dissent that has since arisen. The Act of 1690, which abolished patronage, was solemnly ratified by the Treaty of Union (1707), but in 1712 an Act of Parliament was passed restoring to all patrons their former rights. This Act was opposed by the Church, and was partly the cause of the Secession of 1733, as it was of the Relief Secession of 175 (see UNITED PRESBYTERIANS). During the rest of the 18th c. the C. of S. was completely under the domination of Moderatism; but about the beginning of the 19th c. the patronage question again began to be agitated. The Anti-Patronage Society was founded in 1825, and the Veto Act (q. v.) passed in 1834. The contest, which was carried on during the next ten years, culminated in the Disruption of 1843, and the formation of the Free Church (q. v.). Immediately after the Disruption an Act of Parliament (Lord Aberdeen's) was passed defining the rights of congregations and Presbyteries in the appointment of ministers; but in 1874 this Act, as well as that of 1712, was superseded by another, by which the right of electing ministers was vested in communicants and adherents.

The doctrine of the C. of S., as settled at the Reformation, was Calvinism, and this was fully defined in the Confession of Faith which was adopted in 1643 as the Standard of the Church. After the Revolution two parties arose, subsequently known as Moderates and Evangelicals. The latter were distinguished by their attachment to popular interests and liberties, and by their opposition to all the opinions identified with Arminianism; the former by their steady and uniform support of lay patronage, and their opposition to the doctrinal views of the Evangelicals, on the ground that these tended to Antinomianism. These two parties, with their twofold distinction, do not cover all the Church at the present day. There is a third and growing Broad Church party, holding opinions which show a considerable departure from the teaching of the Confession of Faith. It is not merely that individuals, such as M'Leod, Wallace, Tulloch, Story, Service, &c., have expressed themselves in favour of greater latitude of opinion and greater freedom in subscription to creeds, but the moral inability of the Church to shut the mouths of such men is a proof that the Confession of Faith is a dead letter within her borders, and that her ecclesiastical courts dare not honestly appeal to its decisions on doctrine. It may safely be affirmed that the prosecution of a good man for mere heresy is now regarded by the public conscience as an act of barbarous fanaticism, to be reprobated and denounced by all right-thinking men. Even in the severer sects that have cut themselves off from the C. of S. this holds true (witness the cases of the Rev. Fergus Ferguson and Prof. Robertson Smith); but in a Church claiming not only on *historic* but also on *actual* grounds to be distinctively 'National,' the assertion of the 'principle of comprehension' (within the limits prescribed by the acceptance of Christianity as a 'Divine Revelation') appears to be a sovereign duty no less than a logical necessity. See Reeves, *Adamnan's Life of St. Columba* (1857); *Lives of St. Ninian and St. Kentigern* (1874); *Culdees of the British Islands* (1864); Robertson, *Scottish Abbeys and Cathedrals* (*Quarterly Review*, 1849); *Statuta Eccl. Scot.* (1866); Stuart, *Charters of the Priory of the Isle of May* (1868), and *Book of Deer* (1869); Skene, *Celtic Scotland*, vol. ii. (1877); Burton, *History of Scotland* (1867); Grub, *Ecclesiastical History of Scotland*; Knox, *History of the Reformation*; Burnet, *History of the Reformation*, and *History of his own Time*; M'Crie, *Lives of Knox and Melville*; Spottiswood, *History of the C. of S.*; Hetherington, *History of the C. of S.*; Peterkin, *Book of the Universal Kirk of Scotland*, &c.

Scott, David, a Scottish painter, was born at Edinburgh, October 19, 1806. The son of a landscape engraver, he showed a precocious talent for art, and served an apprenticeship under his father. Turning from the laborious art of the engraver to painting, he at once showed the bold, original cast of his mind by the treatment of ambitious subjects on the grandest scale. His first offering to the British Institution, 'Lot and his Daughters fleeing from the Cities of the Plain,' was rejected on account of its size. But neither hostile criticism nor the lack of patronage could dull in S. the enthusiasm of conscious power, or divert his choice of lofty themes. The 'Monograms of Man,' the illustrations of Coleridge's *Ancient Mariner*, and 'Sarpedon carried by Sleep and Death,' are all marked by grandeur of conception and weird suggestiveness. Two years spent in Italy and France (1832-34) rather tended to confirm the peculiarities of his style and ideal, which appear in all their strength in 'Discord, or the Household Gods Destroyed,' a work painted in Rome as if in defiance of the schools. Among his later productions are 'Ariel and Caliban,' 'The Alchemist,' 'Philoctetes,' 'Queen Elizabeth in the Globe Theatre,' 'Silenus Praising Wine,' 'Richard III.,' 'Jane Shore found Dead in the Street,' 'Peter the Hermit,' and above all 'Vasco da Gama encountering the Spirit of the Cape'—a work of transcendent genius. S. was one of the unsuccessful candidates for the commission to decorate the Houses of Parliament, and the disappointment had a serious effect on his health, at all times delicate. He died 5th March 1849. Gifted with a vivid imagination, S. is perhaps more a delineator than a colourist, and the defects of his execution are least perceptible in engravings such as those of the *Ancient Mariner*, and in the series, 40 in number, of the *Pilgrim's Progress*. Each of his works is a unique pictorial creation, in which the daring originality and splendour of thought withdraws attention from the frequent thinness of colour and weakness in drawing. His happiest efforts are distinguished by dramatic vivacity or elegaic sadness, while the design and sentiment of all his works are in truest harmony. S. contributed several essays on 'The Characteristics of the Great Masters' to *Blackwood's Magazine*. See a *Memoir* (1850) by his brother, **William Bell S.**, who was born about 1810, and who is also a distinguished painter, etcher, engraver, archaeologist, and poet. He became head-master of the Government School of Design at Newcastle, and his principal literary works are *Hades, and Other Poems* (1839); *The Year of the World, a Philosophical Poem* (1846); *Antiquarian Gleanings in the North of England* (1849-51); *Chorea Sancti Vita* (1851); *Poems* (1854); *Half-Hour Lectures on Art* (1861); *Albert Dürer, his Life and Works* (1869), and *Poems* (1875). After a generation of neglect, his poems are now admitted by W. M. Rossetti and others to a high place in modern literature. He presented three large volumes of his etched and engraved works to the British Museum in June 1878.

Scott, Michael, a celebrated wizard of the 13th c., probably born in Fifehire, died about 1291. Accounts concerning him give much that is chronologically impossible, and nothing that can be accepted with certainty. He is probably that Michael Scott, or Michael the Scot, who lived and wrote at the court of the Emperor Friedrich II. He must have been a learned and ingenious man, fond of dabbling in the occult sciences, and thereby gaining notoriety as a worker of miracles. Dante and Boccaccio mention him. He is supposed to be buried in Melrose Abbey.

Scott, Sir George Gilbert, R.A., F.S.A., was born in 1811 at Gawcott, Buckinghamshire, of which village his father was perpetual curate. Placed in his seventeenth year with an architect, Mr. Edmeston, he commenced practice on his own account in partnership with a fellow-student, Mr. W. B. Moffatt, and in 1841 designed the work that first brought him prominently into notice, the Martyrs' Memorial, Oxford. A year later he gained the competition for rebuilding the great Nikolaikirche at Hamburg; in 1848 was chosen to design a cathedral for St. John's, Newfoundland, and in 1854 undertook the restoration of Doncaster parish church, while as architect to the Dean and Chapter of Westminster since 1849, he erected the gatehouse and restored the chapterhouse of the Abbey. He was elected A.R.A. (1855), R.A. (1861), and President of the Institute of British Architects (1873); amongst his works during this period being the Foreign Office (in the execution of which design he was unfortunately hampered by Government), the chapels of

Exeter College, Oxford, and St. John's College, Cambridge, Glasgow University buildings, the Albert Memorial, Hyde Park (which gained him the honour of knighthood, 1872), and the Albert Chapel, Windsor, besides the restoration of cathedrals and churches through England's length and breadth. According to a list in the *Builder* (6th April, 1878), S. built or restored, since 1847, 26 cathedrals, 9 abbey and 2 priory churches, 1 minster, 474 churches, 26 schools, 5 almshouses, 23 parsonages, 57 monumental works, 10 college chapels and 16 colleges, 27 public buildings, 42 mansions, &c. He died at Courtfield House, S. Kensington, 27th March 1878, being at the time engaged on the restoration of the cathedral of St. Alban's, and the erection of St. Mary's Cathedral, Edinburgh. S. was the author of a *Plea for the Faithful Restoration of our Ancient Churches* (1850), *Gleanings from Westminster Abbey* (1862), three courses of Lectures delivered at the Royal Academy (1868-73; 3d. ed. in the press, 1878), &c. The foremost reviver of Gothic architecture, S., in the earlier part of his career, was rather a reproducer of ancient than a creator of independent work, adhering almost servilely to Decorated models; but latterly he diverged to an older and more Continental type of Gothic. It is, however, with restoration that his name will be most closely identified alike by admirers and opponents, the former of whom maintain that his work was always conservative, the latter that he obliterated the truth and value of many of our grandest historic monuments. That in some rare instances he carried restoration beyond its legitimate limits must be conceded, but that to him a future generation will owe the preservation of buildings that otherwise might have shared the fate of Tintern is indisputable.

Scott, Sir Walter, born at Edinburgh, August 15, 1771, was a younger son of Walter Scott, a Writer to the Signet, allied distantly to the Buccleuch family through the Scotts of Harden. When eighteen months old, young Walter lost the use of his right leg in an attack of fever, and though the careful nursing of several years restored to him the free use of his limb, it remained somewhat shrunken and caused a halt in his gait. He was sent for country air to his grandfather's farm of Sandyknowe in Roxburghshire, and afterwards to Bath. In 1779 he returned to Edinburgh, and after a meagre course of private tuition attended the High School, whence in 1783 he passed to the University. Old Dr. Adam of the High School used to say that although many in his class understood Latin better, Scott was behind few in enjoying an author's meaning. However little S.'s enthusiasm for learning at school, it was less at college: he earned the name of *The Greek Blockhead*; and Professor Dalzell, after reading an impudent essay of his instituting a comparison between Homer and Ariosto in favour of the latter, pronounced on him the sentence that dunce he was, and dunce he would remain. It was probably this severe criticism which gave him the soubriquet of Duns Scotus; but the Professor lived to retract his prophecy. Although the classic tongues had few charms for S., he early acquired a fair knowledge of French, Italian, Spanish, and what was rare in his day, German. Already he was known in the debating clubs as a youth of prodigious memory, brimming with miscellaneous information. 'My memory of events,' he says, 'was like one of the large, old-fashioned, stone cannons of the Turks—very difficult to load well and discharge, but making a powerful effect when by good chance any object did come within range of its shot.' After spending six years in his father's law office, reading ballads and books on knight-errantry more than legal treatises, he was called to the bar in July 1792. In 1796 appeared his first literary effort, a translation of Burger's *Lenore* and *Wild Huntsman*; and in the following year, after a hasty courtship, he married Charlotte Margaret Carpenter, daughter of Mme. Charpentier, a French refugee. In 1798 he got £25 from an Edinburgh bookseller for translating Goethe's *Goetz von Berlichingen*; next year he wrote *Glenfinlas, The Eve of St. John*, and *The Gray Brother*. In 1802 appeared the first of many a raid into the southern counties, *The Minstrelsy of the Scottish Border*, of which the following year saw a new edition, completed by a third volume containing poems by himself and friends. Next came his annotated edition of *Sir Tristrem* (1804), and *The Lay of the Last Minstrel*, which in 1805 made him the most popular poet of Europe. *Marmion* (1808), in the description of the battle of Flodden, shows the highest flight of S.'s genius in verse; *The Lady of the Lake* (1810) is the most delightful and universally popular of all his poems; but his

subsequent productions—*The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bridal of Triermain* (1813), *The Lord of the Isles* (1815), *Harold the Dauntless* (1817), *Halidon Hill* (1822), *Auchindrane* (1830), *The Doom of Devorgoil* (1830)—did not attain the same success. In these world-read metrical tales the scenery is always fresh, and the characters are vigorously marked. S. catches the ring and the gallop of the old ballads, and 'seems the brother-in-arms of Froissart.' He is active—not reflective, and may be best described as a perfect contrast to Wordsworth, who could never describe a battle, and in whose instrument there is no trumpet-stop. Rich as are his effects, S. has little of the distinctively poetical about him. Stripped of rhyme and metre, the quality of his verse would be that of his prose. Landor, indeed, goes the length of saying that Scott never wrote but one line of true poetry—that descriptive of the dog and his dead master on Helvellyn—

'When the wind waved his garment, how oft didst thou start?'

Such criticism is mere insolent perversity. Many of Scott's lyrics contain lines as good as this; and not a few (e.g. *Jock of Hazeledean*, *County Guy*, *Bonnie Dundee*) are perfect in rhythm, diction, and sentiment; but the highest rank among poets cannot be claimed for him. The true field for his genius was opened in 1814 by the anonymous *Waverley*. The first volume of this novel had long lain in a drawer in the form of condemned MS. Wincing at the failure of his latest poems, Scott determined to try a historical romance in prose, and dashed off the second and third volumes between June 4th and July 1st. Notwithstanding the rapturous reception of his work, Scott wrote, 'I shall not own *Waverley*; my chief reason is, that it would prevent me the pleasure of writing again.' This policy of concealment he carried through with many subsequent novels, sometimes blankly denying that he was their author. Meantime he had begun to build himself the 'Castle of Despair' on the Tweed. His poems had brought him large sums, and he held the office of sheriff-depute of Selkirkshire, which brought him £300 a year. He subsequently earned £800 a year as a clerk of session; and he was a secret partner in Ballantyne's flourishing printing business. His ambition was not so much to attain importance in the literary world, as to obtain a proud position among the county gentlemen of Roxburghshire. In 1811 he bought a small farm on the Tweed for £4000 and called it Abbotsford. As he grew famous and rich, the farmhouse gave place to an ever-increasing Gothic mansion, and all purchasable land around was added to the estate, often at exorbitant prices. A lavish expenditure now became necessary, for Abbotsford received all the great world that crossed the Border. While his dreams were thus being realised in stone and lime, Scott never relaxed his toil. Visitors wondered how he accomplished his work, for daily after eleven o'clock he was ready to spend his time in the hunting field or elsewhere. He seldom breakfasted before accomplishing one chapter at least of some novel. Thus were produced *Guy Mannering* (1815), *The Antiquary*, *The Black Dwarf*, *Old Mortality* (1816), *Rob Roy* (1817), *The Heart of Mid-Lothian* (1818), *The Bride of Lammermoor*, *A Legend of Montrose*, *Ivanhoe* (1819), *The Monastery*, *The Abbot* (1820), *Kenilworth*, *The Pirate* (1821), *The Fortunes of Nigel*, *Feu de la Peak* (1822), *Quentin Durward*, *St. Ronan's Well* (1823), *Redgauntlet* (1824), *The Betrothed*, and *The Talisman* (1825). In 1820 George IV. made S. a baronet. Meanwhile the great author, in his eagerness to embellish Abbotsford, had obtained large advances from his printers and publishers. But in 1826 Constable & Co., the publishers, suspended payment, and immediately it appeared that Ballantyne was hopelessly involved with them. S.'s partnership was revealed as existing since 1805, and his liabilities amounted altogether to £150,000. 'Time and I against any two,' he repeated, in reply to all condolence. He meant to pay every debt to the last farthing, and resumed the pen in the midst of his trouble. *Woodstock* was in print before the crisis occurred, and its first edition was sold to Longman's & Co. for more than £9000. *The Life of Napoleon* was published in the same year, realising £18,000. Thus the retrieval of S.'s fortune began nobly. The Great Unknown's tattered disguise was thrown off at a dinner given for the benefit of the Edinburgh Theatrical Fund, February 22, 1827. His miscellaneous work up to this time included editions of Strutt's *Queen's Hall* (1808), Carleton's *Memoirs of the War of the Spanish Succession* (1808), *Memoirs of the Earl of Monmouth* (1808), Dryden (18 vols.

1808), and Swift (19 vols. 1814), *Original Memoirs written during the Great Civil Wars* (10 vols.), *The State Papers and Letters of Sir Ralph Sadler* (1809), *The Somers Tracts* (13 vols. 1809-15), *Paul's Letters to his Kinsfolk* (1815), *Border Antiquities of Scotland* (2 vols. 1818), *Lives of British Novelists* (2 vols. 1825), *Letters of Malachi Malagrouther* (1826). His remaining writings are—*Miscellaneous Prose Works* (6 vols. 1827), *Chronicles of the Canongate* (1828), *Tales of a Grandfather* (1827-29), *The Fair Maid of Perth* (1828), *Anne of Geierstein* (1829), *History of Scotland* (for Lardner's *Encyclopædia*, 1829-30), *Letters on Demonology* (1830), *Count Robert of Paris and Castle Dangerous* (1831). In 1821 an annotated edition of the *Waverley Novels* was prepared, and met with great success. In 1830 S. resigned his clerkship. He was offered the rank of Privy Councillor and a pension, but declined both. In April 1831 he was seized with apoplectic paralysis, and in October he set sail for Italy in a Government frigate. Returning from Italy by the Rhine, he received a second stroke of paralysis at Nimeguen on the 9th of June 1832, and thenceforth his desire to return to Abbotsford brooked no delay. Abbotsford he reached on the 11th of July, and there he died on the 21st of September. He was buried on the 26th in Dryburgh Abbey. A monument erected to his memory in Princes Street, Edinburgh (1840), is one of the most splendid ornaments of the city.

Burns and S. are Scotland's greatest sons. The first was destitute of that which sometimes detracted from the other—a shrewd business talent which enabled its possessor to look at things through the world's eyes. The one took nature as he found it, and glorified it; the other revived the past, and drew pictures of the Middle Ages with Rembrandt's effects of light and darkness. Genius prompted almost every poem of Burns; much of S.'s work was accomplished by the combination of a far-reaching memory and a mechanically inventive imagination. S. worked hurriedly for gold; slower, he would have been surer of posterity's applause. The opinion of his latest eminent critic—Fitzjames Stephen—is that S.'s claims on immortality are precarious. The faults of his hasty style can never be overlooked; yet it may be affirmed that as long as the love of chivalry and the sense of the picturesque are cherished—as long, at least, as Scotland cares to analyze the national characteristics that have given her a name—so long will Scott be loved and read. It would be vain to attempt an estimate of the circulation of S.'s novels. It may be suggestive enough to state that in France alone, during the author's life, 1,400,000 volumes of his works were sold. See the *Life of Sir W. S.* by his son-in-law, Lockhart (7 vols. 1837-39; new ed. 10 vols. 1869). The *New York Herald* of June 3, 1878, published the first instalment of selections from S.'s letters to Ballantyne, a collection of which is expected to be published in 1878. A *S. Dictionary*, giving in alphabetical order an analysis of plots, characters, &c., by Mary Rogers, is in the press (New York, 1878).

Scott, Thomas, D.D., the Biblical commentator, was born at Baytoft, near Spilsby, Lancashire, February 16, 1747. By hard private study he qualified himself for the ministry of the Church of England, and was ordained in 1772. In 1780 he became curate of Olney, where he made the acquaintance of Cowper. In 1785 he was appointed chaplain of the Lock Hospital, and in 1801 vicar of Aston Sandford, Buckinghamshire, where he died April 16, 1821. He was a strong Calvinist, and wrote, among other works, a *Vindication of the Divine Inspiration of the Scriptures*, a reply to Tom Paine. His reputation, however, rests upon his popular *Family Bible with Notes* (1796), which has been frequently reprinted both in England and the United States.

Scott, Winfield, an American general, born near Petersburg, Virginia, June 13, 1786. He was early admitted to the bar, but in 1808 became captain of artillery, and was promoted to the rank of lieutenant-colonel at the beginning of the war with Britain in 1812. After being held prisoner for about a month, he led the assault on Fort George, 27th May, commanded the rearguard in the retreat from Stoney Creek in June, and made the descent on Burlington and York in September. In 1814 he captured Fort Erie, and, with Jacob Brown, won the victories of Chippewa and Bridgewater or Lundy's Lane. He issued *General Army Regulations* (1818) and a *System of Infantry and Rifle Tactics* (1826). In 1841, after quelling several Indian risings and settling the Canadian frontier troubles (1837-38), he

was made general-in-chief, and commanded in the brilliant Mexican campaign of 1846-48, which ended in the cession of Texas, New Mexico, and Upper California. He was the Whig candidate for the presidency in 1852, but was defeated by Franklin Pierce. Two years later he was made lieutenant-general, and on the outbreak of the war of the Secession in 1861 he retired from active service. Dreading the consequences of the impending struggle, he suggested that freedom should be allowed 'the wayward sisters to part in peace.' He published an *Autobiography* in 1864, and died at West Point, May 29, 1866.

Scottish Language and Literature. The 'Scottish language' properly means the Gaelic dialect of Celtic used by the Scots after their settlement in North Britain among the Picts; and down to the 15th c. the phrase *lingua Scotica* never denoted anything else. During the 15th c. the recognition of its Irish origin led to its being also called *lingua Hibernica*, or in the vernacular, 'Yrishe' or 'Ersch' (mod. 'Erse'). Long before this, however, the name 'Scottish' had been applied to the whole people of Scotland, both Teutonic and Celtic; and as the former became more and more the dominant race, the term 'Scottish' came in time to be applied to the Anglic dialect of the Lowlands. This transference of name was all the more easily made that the lapse of years and the effects of political strife had thoroughly alienated the Angles of Lothian from their brethren of Durham and York. The first native writer who called the dialect of the Lowlands 'Scottish' was Gavin Douglas in the year 1516, though it had been so designated as early as 1498 by Don Pedro de Ayala, the Spanish pro-notary at the court of James IV., in a letter to his sovereigns, Ferdinand and Isabella. Before the close of the 16th c. this use or abuse of the term had become universal in the Lowlands, and has ever since been recognised in England. (For an account of the S. L. and L. in its primary and proper sense, see GAELIC LANGUAGE AND LITERATURE.) This article is strictly confined to a notice of that Anglic dialect commonly designated 'Lowland Scotch' and of the literature which it contains. To understand its origin it is necessary to remember that till the middle of the 10th c. the kingdom of Scotland embraced no territory S. of the Forth. Strathclyde (q. v.) was a Cymric principality, and the Earldom of Lothian (q. v.) was part of the English kingdom of Northumbria (q. v.). This earldom, which included the whole S.E. of the present kingdom of Scotland from Liddesdale to Stirling, passed by grant to the Scottish kings in 975, who held it on the same tenure as the Northumbrian eorls; and thus the Anglic dialect obtained a footing within the boundaries of the Scottish kingdom. In the article SCOTLAND it has already been pointed out that in the 11th c. a powerful impetus was given to the spread of English by Margaret, sister of Eadgar the Ætheling, and wife of Malcolm Ceanmohr. Her own dialect would of course be Wessex or Southern English, but the neighbourhood of Lothian and the long exile of Malcolm in Northumbria would irresistibly determine the form of English that would be adopted in Scotland. The insecure and fluctuating rule of the Norsemen along the N.E. coast, from Caithness to the Firth of Tay, during the 9th and 10th centuries, is sufficient to account for those local peculiarities of diction which lend a curious flavour to the sub-dialects of Buchan and Forfar, but in no way diminish their right to be considered the legitimate offspring of an English mother. In fact, the majority of these peculiarities are more attributable to Celtic than to Scandinavian influences.

Of the earlier history of the Anglic dialect north of the Tweed we are wholly ignorant. How it grew and spread, what obstacles it encountered, and in what ways it was modified, we can only conjecture. This arises from the paucity, one might almost say the total absence, of literary monuments. The inscription upon the Ruthwell Cross in Dumfriesshire (7th c.), and some words interspersed in the Latin charters and laws of David, William the Lion, and his successors, constitute the entire remains of this speech between the 7th and the 14th centuries. These, however, are sufficient to prove that it approximated in its grammatical forms to the Scandinavian and Frisian rather than to the Saxon of Wessex. The same remark holds good of the whole Anglic dialect of Northumbria.

Between the 11th and the 14th centuries the Anglic tongue steadily extended itself in Scotland at the expense of the Celtic dialects of the S.W. and the N., but it does not appear to have

become the recognised vernacular of the entire Lowland community till at least the reign of Alexander III. A curious and hitherto unnoticed passage in *Blind Harry* (Bk. vi.), in which Wallace is mockingly saluted in bad Gaelic by an English soldier of the Lanark garrison, might almost warrant the inference that Celtic was still prevalent in Strathclyde in the days of the hero. The great struggle for Independence (1297-1314), which created the Scottish nation, was carried on by the Scoto-Anglic and Scoto-Norman population, the Celtic clans ranking mainly on the English side; and this fact in all probability finally secured the supremacy of the Teutonic speech. No sooner was the long-deferred unity or nationality of Scotland attained than an Anglic literature sprang into existence, which at one time promised to rival if not to surpass that of the south in the splendour and strength of its poetry.

'From the 14th c. onward,' says Dr. J. A. H. Murray, 'Scotland presents a full series of writers in the Northern dialect, which as spoken and written in this country may be conveniently divided into THREE periods. The first or EARLY period, during which the literary use of this dialect was common to Scotland with England north of the Humber, extends from the date of the earliest specimens to the middle or last quarter of the 15th c. The second or MIDDLE period, during which the literary use of the northern dialect was confined to Scotland (the midland dialect having supplanted it in England), extends from the close of the 15th c. to the time of the Union. The third or MODERN period, during which the northern dialect has ceased to be the language of general literature in Scotland also, though surviving as the speech of the people and the language of popular poetry, extends from the union of the kingdoms to the present day.'

The language of the first of these periods differs in no essential respect from that which was current in England as far S. as the Trent. A comparison of the literary remains of both districts proves (1) that they used to a large extent the same words and the same forms of words; e.g., *mirk*, *hyggin*, *gar*, *stane*, *ald*, *cald*, *wrang*, *hyng*, &c.; (2) the same grammatical inflections, as seen (a) in irregular plurals, e.g., *childer*, *kye*, *schone*; (b) in the use of the indefinite articles as a numeral; (c) in the identity of their demonstratives, and of their verbal forms, e.g., *thow cumis*, *clerkes sayis*, *we that lyves*, *falland*, in the use of the preposition *tyl* for *to*, &c.; (3) the same orthography, e.g., in the guttural *gh* (changed in later 'Scotch' into *ch*), in the change of the old English *hw* into *gw*, *qu*, *guh*, and *guh*. The most famous names in the vernacular literature of this first period are Barbour (q. v.), Wyntoun (q. v.), King James I. (q. v.), Henryson (q. v.), and Blind Harry (q. v.). Barbour is by far the greatest of metrical chroniclers, a class of poets who sought to win the ear of an audience by stirring narrative rather than by imaginative sentiment, and who were a genuine product of the Middle Ages. In his noble rhyme, Barbour narrated the heroic struggle of the Bruce with a vivid minuteness of detail that has engraven itself indelibly on the national memory. Wyntoun was a humbler artist, who undertook to recite in verse the history of Scotland, and thought it necessary to start from the creation of Adam. In the *Kingis Quhair* of James the Anglic poetry of Scotland underwent its earliest literary change. The simple unadorned semi-prosaic style of the chronicles gave place to a delicacy and refinement of imaginative feeling, a richness and elegance of diction, and a certain artistic ambition in the choice of verse. The great influence of Chaucer on the Scottish poets of the next period was perhaps due to the prince whose long captivity in England was brightened by the charms of love and the delights of literature. Henryson was the finest poetic genius of the 15th c., and not even Chaucer himself has surpassed the author of the *Testament of Cresseid* in melody of verse or tenderness of sentiment. Blind Harry is the rudest of minstrels, yet his fierce and prejudiced verse shows us, only too well, the pernicious effect of those desperate attempts on the part of the English kings to overthrow the liberties of a proud and obdurate nation. The only relic of prose literature in this period is the *Craft of Deyng*, but for linguistic purposes the old Scottish laws are of great value. Latin authors like Fordun (q. v.) and his continuator do not come within the scope of this article.

The second period of the Anglic literature of Scotland is that in which it becomes distinctively national. The genius of Chaucer had raised the E. Midland dialect of English to the rank of a classic or standard for his countrymen. As a consequence of this, the northern dialect gradually 'ceased to be

Scotus and Scotists. See DUNS SCOTUS.

Scotus Erigena. See ERIGENA.

Scrap Metal is a general term for old and worn-out articles of metal, as well as the fragments and parings produced in their manufacture. S. M. is re-melted to be worked over again.

Scream'er (*Palamedea*), a genus of *Grallatorial* or Wading Birds, having a cylindrical horn on the head, oval nostrils, toes covered with quadrate scales, and the third and fourth wing-quills best developed. The *P. cornuta*, the horned S. of tropical America, attains the size of a turkey, and is of a blackish-brown hue. The Chaja or Crested S. (*Chaja chavaria*) has a hooked bill, and belongs to a different genus from the horned S. The latter occurs in Paraguay and Brazil, its colour being a bluish-grey interspersed with black.

Screens, in churches, are partitions of wood, metal, or more rarely stone, enclosing the choir, separating side chapels, or dividing the chancel from the nave, in the last case being usually surmounted by the Rood (q. v.). The upper part consists of open work, the lower is solid, and the whole is frequently richly carved and painted with figures of saints, a circumstance which led to the destruction of numbers of S. by the iconoclasts of the 16th and 17th centuries. With the Gothic revival many S. have been restored or re-erected, though not without protests from the Low-Church party, as in the case of Christ Church Cathedral, Dublin (1878). In mediæval halls, S., extending across the lower end, formed a lobby, with a gallery above, as in the halls of the Oxford and Cambridge colleges.

Screw, in ordinary language, is a cylinder surrounded by a spiral ridge or groove every part of which forms with the axis a constant angle. As a mechanism, however, the S. is a kinematical combination for transforming circular into rectilinear motion, or *vice versa*. It consists of two elements, the *nut* and what is ordinarily termed the S. To the spiral ridge on the exterior of the S. there is a corresponding groove on the interior of the nut, and any relatively rotatory motion of these is necessarily accompanied by a relatively translatory motion. Hence, if either be fixed the other can be made to advance or recede by rotating it round the common axis. For one complete rotation there is translation through a distance equal to the interval between the threads. The smaller the interval the finer the S., and the smaller the distance traversed during one rotation. The S. is, consequently, an invaluable mechanism for fine adjustments, such as are required in good telescopes, microscopes, micrometers, dividing engines, &c. In the S.-press and S.-jack it is used for the application of great pressure, in the gimlet we have it as a borer, and in the ordinary S.-nail we see it employed for fastening separate pieces of material together. In a modified form it effects the propulsion of ships. See SCREW PROPELLER.

Screw Pine (*Pandanus*), the type and principal genus of *Pandanaceæ* (q. v.), is so called from the leaves having a uniform spiral arrangement around the axis, while the fruit may have suggested *pine*, or the tufts or crowns of leaves at the end of the branches of the *pine-apple*. The number of species is placed by Dr. I. B. Balfour, the latest authority, at about ninety, a large proportion of which abound in the vicinity of the sea in the Mascaren Islands and the islands of the Indian Archipelago. Most of the species are large bushes, but some form much-branched trees. The genus is distinguished by its male and female flowers being always on separate plants, and by the male inflorescence being a compound spadix made up of a number of short catkin-like spikes, each of which bears an immense number of little naked flowers, and the female a globular or oblong head consisting of very numerous closely packed ovaries, each containing a single ovule. The fruits are wedge-shaped clusters of drupes congregated frequently into large cone-like heads. The long, narrow, tough and leathery leaves bear recurved spines along their midrib and margins. A special characteristic of the *Pandani* is their power of sending forth from all parts of the stem aerial roots provided on their tips with cup-like spongioles which act as preservatives from injury until the soil is penetrated. When firmly rooted these roots serve as props or stays to the plant. The fruit of some species is used for food, and the flowers of the wide-spread *P. odoratissimus* are boiled and eaten with meat in India, where also perfumeries in the form of oil,

attar, and scented water, obtained from the powerfully fragrant flowers of this species, are in high esteem. In the Mauritius the strong bags used for packing sugar are made from the split leaves of *P. utilis*. Of the remaining genus *Freylinia* the fleshy bracts of *F. Banksii*, the S. P. of New Zealand, are eaten by the natives, and furnish also a luscious jelly.

Screw-Propeller, is a modified form of screw, adapted for propelling a vessel through the water. The idea of utilising a screw for such purposes of navigation is as old as the days of Hooke (1680); and in 1794 Lyttleton patented an 'aquatic propeller' which consisted of a screw revolving in a frame placed at the head, stern, or side of a vessel. Bramah in 1784, and Shorter in 1799, also took out patents; but these led to no useful result. Colonel John Stevens, of Hoboken, New Jersey, seems to have been the first that successfully propelled a vessel by a screw set at the stern. In 1804 he constructed a boat with twin screws; and in 1806 built a second and larger boat, called the *Phanix*, which was provided with a single screw, and which made a successful passage to Albany in 1807. In 1836, English patents were obtained by Francis Pettit Smith, a farmer of Rodney, and Captain John Ericsson. The improvement introduced by the former was setting the screw in an open space in the dead-wood at the stern, whereas previously the screw had simply projected from behind. Ericsson's screw consisted of several blades, the twist of which was determined theoretically. Further, he was the first to couple the engine directly to the shaft of the propeller; and to him, indeed, not only are many improvements due, but also the practical introduction of the propeller in steam navigation. His first vessel, the *Francis B. Ogden*, was tried in April 1837, and in the succeeding May it towed the *Toronto*, an American packet of 700 tons burden, to sea, making 4½ knots an hour against wind and tide. His second vessel, built in 1837 by the Lairds of Birkenhead, was built for Captain Stockton of the United States Navy, and was subsequently purchased by the Delaware and Raritan Canal Company. The British Admiralty took up the question about 1840, and for experimental purposes constructed the *Rattler*. One result of these practical inquiries was the diminution in length of the screw, which was cut down from 5 feet 9 inches to 1 foot 3 inches. As early as 1838, James Lowe had shown that the length should not exceed one-sixth of the *pitch*, where the pitch is the distance the screw would advance during one revolution, provided there were no loss of energy. Much of the energy of rotation of the screw, however, is wasted through friction, and consequently the real *rate* or actual advance is less than the pitch by an amount which is technically known as the *slip*. The slip varies with the twist, the velocity of rotation, and the depth of immersion, of the propeller; and to diminish it as far as possible is one of the great problems of steam navigation. The theory of the S.-P. is simply a particular case of the theory of screws in general, complicated by considerations of the nature of the materials which are in use. As a screw advances in its nut, or as a gimlet perforates a piece of wood, in exactly the same way does a propeller move through water, though possibly at the same time there is an auxiliary action due to the creation of a partial vacuum in front of the screw. It is at once evident, then, that reversal of the direction of rotation of the propeller is accompanied by reversal of direction of motion of the ship; and the direct effect of reversal when a vessel is going forward is to retard the motion and bring the ship to a standstill. From the inquiries by a committee of the British Association (1878), it would appear that while a vessel is thus being stopped by a reversed screw, it is quite beyond the control of the helm; and that consequently, when a collision is imminent, it is usually much safer to steer the vessel aside, since the screw-steamer can be turned in a distance not greatly exceeding the distance which it would advance before it could be brought to a standstill even with the screw reversed full speed. This would not be the case, of course, were the action of the helm at all sure during reversal. The comparative merits of the screw and paddle form an interesting inquiry. For vessels of war the superiority of the screw is incontestable, since its chances of being injured by the enemy's shot are very small on account of its position, and because it allows a clear broadside for the guns. The rolling of the vessel does not much affect the efficiency of the screw, and though the paddles have the advantage during pitching, the balance in stormy weather is in favour of the screw.

In smooth water and for short voyages, paddles are the best; and the motion of the paddle-steamer is more agreeable to passengers than that of the screw-steamer. The centre of mass of the latter is lower, and the rolling consequently greater, while the rotation of the screw and shaft gives rise to an unpleasant continuous vibration. In the British navy the screw is universally employed, and in the merchant service, the large sea-going vessels are equipped with a screw, at least as an auxiliary. Frequently, when a vessel is sailing before a good wind, it outruns the screw, which consequently retards its progress. To obviate this difficulty various plans are adopted. The screw may be disconnected from the shaft and permitted to rotate freely; or it may be lifted quite out of the water. Maudsley's feathering screw, the blades of which can be set flush with the keel and thus offer little further resistance, is intended to do away with this disadvantage. It is of necessity two-bladed, and rests naturally in an upright position.

Screw-Wrench is a wrench whose movable jaw is opened and closed by a screw-mechanism. It is intended for grasping the flat sides of the heads of large screws, so as to unscrew them. The movable jaws form planes, which remain always parallel whether advancing towards or receding from each other.

Scribe, Augustin Eugène, a prolific French author, was born at Paris, December 25th, 1791, educated for the law, and began his career as a playwright at the age of twenty with *Les Derviches*, a light comedy which failed. In 1816, along with Delestre-Poirson, he produced *Une Nuit de la Garde Nationale*, which proved a brilliant success, and was followed by *Le Nouveau Pourceaugnac* and *Le Solliciteur*. Henceforth he had two pieces, and sometimes three, acted in Paris simultaneously. For the Gymnase he wrote in ten years (1821-31) 150 plays, while he also contributed to the Française, Vaudeville, and Variétés theatres. Among his best are *Les Premiers Amours*, *Le Mariage Enfantin*, *La Reine de Seize Ans*, and *Le Diplomate*. He employed many distinguished men to fill up his sketches, and drove the trade of literature so successfully as to leave the largest fortune ever acquired by a French man of letters. In 1838 he entered the French Academy. He died February 20, 1861. A catalogue of his works filled thirty-six columns of *La France Littéraire*. An edition of his writings appeared in 2 vols. (1833-37), another in 26 vols. (1855-58), while a third in 50 vols. is (1878) in course of publication. See Legouvé, *Eugène S.*, *Conférences des Matinées Littéraires* (1874).

Scribes (Heb. *sopherim*, 'those occupied with books,' from *sopher*, 'a book'), in the early times of Jewish history, were officers who acted as public writers, secretaries to the king, &c. (cf. Ju. v. 14; 2 Kgs. xii. 10, xxv. 19, &c.) 1. From the Captivity till the death of Simon the Just (B.C. 458-300), the S. were those who copied the Law for themselves or others, those skilled in the Law, or interpreters of Scripture (cf. Ezra vii. 6, 12; Neh. viii. 1, &c.; Jer. viii. 8). 2. The successors of these, who were the S. proper, were the Tanaim (Aram. 'Repeaters' or 'Teachers of the Law': B.C. 200 to A.D. 220), also called the Sages, the Wise, and afterwards Rabbis. 3. The Amoraim (Aram. 'Recorders,' 'Expositors,' A.D. 220 to about 500), were those Doctors of the Law, who, after the redaction of the Mishna (q. v.), were the authorised recorders and expositors of the Halacha (q. v.). 4. The Saboraim (Aram. 'Deciders,' A.D. 500-657) were the Doctors of the Law who determined what was law from the controversies of the Amoraim contained in the Talmud. 5. The last Doctors of the Law in Rabbinic succession were the Gaonim (A.D. 657-1038), a title which properly belonged only to the Presidents of the two colleges of Sora and Pumbedita. The work of these colleges was to explain difficult points in the Talmud, answer questions sent in from the different Jewish communities, and enact new laws.

Scribing, in carpentry, the operation of fitting the edge of a board to any surface; as, for instance, the skirting-board of a room to the inequalities of the floor.

Scrip, the certificate of joint-stock shares, issued on the signing of a contract of co-partnership, valid until the company is established with the authority of opening regular books for the enrolment of shareholders and the transfer of stock. The sale of S. does not transfer responsibility from the original purchaser.

Scrivener, Frederick Henry Ambrose, LL.D., born at Bermondsey, 29th September 1813, passed from St. Olave's Grammar School, Southwark, to Trinity College, Cambridge, where he gained a scholarship (1834), graduating B.A. (1835), and M.A. (1838). After holding an under-mastership at Sherborne, and the curacy of Sandford Orchas, he became in 1846 head-master of Falmouth School and incumbent of Penweris, and in 1861 was presented to the rectory of Gerrans, Cornwall. A member of the Company of Revision of the New Testament since 1870, he received in 1872 a pension from Government, and from the University of St. Andrews the honorary degree of LL.D. His masterly contributions to Biblical criticism include editions of the Greek Testament (1860); the *Codex Beza* (1864), and the *Cambridge Paragraph Bible* (1873); a *Plain Introduction to the Criticism of the New Testament* (1861; 2d ed. 1874); a *Full Collation of the Codex Sinaiticus with the Received Text of the New Testament* (1863), and *Six Lectures on the Text of the New Testament, and the Ancient MSS. which contain it* (1874).

Scrof'ula. See TUBERCULOSIS.

Scroll, a convolute ornament based on natural forms, and introduced in decoration in various ways. It occurs, primitively simple, in Egyptian paintings, and, with florid elaboration, in the arabesques of the Renaissance. Volute (q. v.) is sometimes used synonymously with S.

Scrophularia'ceæ, **Scrophularin'ææ**, or the Figwort Family, is a large natural order of monopetalous dicotyledons, consisting of about 180 genera and 1800 species of herbs, undershrubs, or shrubs, and a few trees. It has representatives in all climates. The order is distinguished by the following characters:—leaves opposite or alternate, without stipules; flowers irregular, either axillary or in terminal racemes or panicles; corolla of 4-5 lobes; perfect stamens 2-4; ovary superior, 2-celled, with numerous ovules in each cell. S. are generally acrid and bitter; some are purgative, emetic, or poisonous. The most important medicinal species is *Digitalis purpurea*—the Foxglove (q. v.). Plants of the tribe *Euphrasia* are Root-Parasites (q. v.). Many garden ornaments are furnished by this order, such as the genera *Antirrhinum* (see SNAPDRAGON), *Calceolaria* (q. v.), *Linaria* (see TOADFLAX), *Mimulus* (q. v.), *Verbascum*, *Veronica* (see SPEEDWELL), &c.

Scruple (Lat. *scrupulum*, 'a small pebble') was among the Romans the lowest weight, being the twenty-fourth part of an ounce. In Troy weight it has the same value, being the third part of a drachm, and equivalent to 20 grains.

Scudéry, Madeleine de, born at Havre, June 15, 1607, began her literary life with one or two novels in part written by her brother. She became one of the great attractions of the Hôtel Rambouillet, and for a time was reckoned a tenth muse. Now she is reckoned the Muse of Dulness. Some people still read her romance of *Artamène* (10 vols. 1650) because of its sketches of her contemporaries under assumed names. But her other works, *Ibrahim, ou l'Illustre Bassa* (1641), *Clidie* (1656), *Histoire Romaine* (1656), *Les Femmes Illustres* (1665), and all the rest, each extending to eight or ten volumes, are now entirely forgotten. She died at Paris, 2d June, 1701. See *L'Esprit de Mademoiselle de S.* (Par. 1766).

Scudo (Lat. *scutum*, 'a shield'; comp. Fr. *écu*, Old Fr. *escu*, 'a crown,' also from the Lat. *scutum*), a coin and money of account used in Italy before the introduction of the decimal coinage. Its value was about 4s. sterling, corresponding very nearly to the American dollar or the British crown. Each of the old Italian states had its own S. That of Genoa was valued at 5s. 3d., while that of Modena was only 3s. 4d. It is now superseded by the lira, five of which were equivalent to the S. *nuovo* of the kingdom of Italy. In Malta the S. was also once current; its value was about 1s. 6d.

Scull (Icel. *skol*, 'to plash'), a light short oar, a pair of which are plied by one rower. Besides the operation implied, the term *sculling* signifies the act of propelling a boat by working an oar from side to side of the stern without raising the blade from the water.

Sculpture (from Lat. *sculpo*, 'I carve'), the art of carving, in the round or in relief, in stone, wood, metal, or gems. In the higher sense S. is the counterpart of painting; the one in

its pure state dealing with form, and actually reproducing in tangible material its rounded surfaces, the other calling colour to the aid of drawing and simulating inequalities of surface by the art of perspective. For an account of S. in metal and wood see CHASING, ENGRAVING, and CARVING. The cutting of precious stones is dealt with in the articles CAMEO, GEM, and INTAGLIO. S. and religion are early associated; the Israelites, for instance, are exhorted to abandon the worship of graven images. The artist-devotee, in his efforts to symbolise divinity, usually grafted on the human form the incongruous attributes of brute strength and intelligence. The Egyptians are the first people who elevated S. almost to a pure art. The oldest statues in existence are now believed to be those of the Sheik Ra-em-ké, of Schafra, of Ra-hotep, and of Nefer-t, his sister or wife, discovered at Sakkarab by Mariette Bey, who ascribes the two last to the third dynasty (B.C. 4449). They are all more natural and expressive than later Egyptian sculptures. The two last are of limestone, while the second is diorite and the first of cedar-wood, coated with flesh-tinted stucco. The eyeballs are pieces of opaque quartz, having bits of rock-crystal to represent the pupils. According to M. Lenormant the Egyptians are the only people who began by following nature and ended by sinking into slavish conventionality. The S. generally accepted as typical of Egypt (q. v.) belongs to a much later period and has little artistic value. Assyrian S. is more barbarous than that of Egypt, but is freer from the deadening effect of stereotyped ideals. Its colossal, human-headed bulls and winged lions, its bas-reliefs of battles, hunting scenes, and court episodes form a narrative surpassing in vigour if not in minuteness that of the sculptured and painted walls of the Pharaohs. The Assyrians failed in their treatment of the human figure; their masterpiece is the famous Wounded Lionesses. The sculptured remains of the Etrurians, chiefly in bronze, stone, and terra-cotta, point to a close connection with the Greeks, and their chief faults are exaggerated attitude, with an unnatural position of the hands and meagreness of detail (see ETRURIA). In Greece S. attained its utmost perfection in more dramatic expression and the suggestion of freer movement, in scientific grouping of figures and a higher idealisation of style. The Dædalides, or early sculptors (so called after Dædalus of Athens), wrought in wood, but the later artists used Parian marble (see PAROS), besides gold and ivory. During the glorious age of Phidias (q. v.) the Greeks combined different marbles in polythitic S., and employed wood and metal for the draperies, &c. These devices have been condemned by most modern critics. The greatest works of Phidias were the sculptures of the Parthenon (see ELGIN MARBLES), the statue of Minerva, and the Olympian Jupiter at Elis. His favourite pupils were the rivals Alcámenes of Athens and Agoracritus of Paros. The host of artists who sprang up after Phidias are conspicuous enough in literary history, but are almost unknown by their works. Polyclethus, famed for his ideals of youthful beauty, was opposed by Myron, a master of manly form and sculptor of the ideal Hercules. The 'beautiful style,' in which grandeur was forsaken for grace, found its highest expression in the works of Scopas (q. v.), Lysippus (q. v.), and Praxiteles (q. v.). The last and greatest of these was the first who ventured to carve an undraped Venus. Others of this period were Chares, who cast the Colossus of Rhodes, Alexander and his three sons, the authors of the Laocoon (q. v.), and Glycon, to whom is inscribed the Farnese Hercules at Naples. The Romans carried off most of the great Greek sculptures to Rome. Fond as they were of art, the Romans themselves produced no great artist, and after the age of Hadrian, S. gradually declined to a formal repetition of outlines. The so-called Romanesque and Byzantine styles are feeble imitations of the Classical, which had long lost its meaning. Before the Renaissance, unknown mediæval carvers had covered the façades of Lombard churches with fanciful, dramatic groups of men and animals. Later, a race of northern Gothic sculptors adorned the porches and façades of churches with a maze of magical invention, unrivalled in its natural loveliness. But the Renaissance only affected S. when Niccolò Pisano combined the liberal study of Græco-Roman art with a genuine love of nature. Pisano's masterpiece in S., a 'Deposition from the Cross,' dates about 1233-37. Giovanni Pisano fused his father's manner with the Gothic style. Andrea da Pontadera, called Andrea Pisano, under the influence of Giotto, inclined S. to picturesque effects; his greatest pupil was the many-sided Orcagna. The four great Tuscan masters were

Della Quercia, Brunelleschi (q. v.), Ghiberti (q. v.), and Donatello (q. v.). The gates of the Florentine Baptistry by Ghiberti are the supreme achievement of Tuscan bronze-casting. Scarcely inferior names, all Tuscan, are Lucca della Robbia, Agostino di Gucci, an exquisite master in terra cotta, Antonio Rossellino, Matteo Civitali, Mino da Fiesole, Benedetto da Majano. The Renaissance had entered on its new pagan phase, when Michael Angelo (q. v.) elevated the mixed motives of contemporary S. into marvellous ideals of vehement emotion and Dantesque dignity. Cellini's reputation as a sculptor rests chiefly on his 'Perseus.' S. died out in Italy about the end of the 16th c., and the names of Bernini, Algardi, and Canova (q. v.) mark the chief attempts at revival. Canova, refined but affected, was the master of Thorwaldsen (q. v.), Bartolini, Dupré, Nela, &c. In Germany the 15th c. saw the quaintly beautiful work of the Nürnberg artists, Vischer (q. v.), Schönhofer, and Kraff; in recent times the greatest German sculptors were Rauch (q. v.), Rietschel (q. v.), Schwanthaler (q. v.), and Bandel (q. v.). In France alone the Renaissance spirit survived, and the fame of the school has been maintained by Puget, Girardon, Houdon, author of the busts of Molière and Rousseau, Rude, who carved the 'Departure' bas-reliefs for the Arc-de-Triomphe, Marochetti (q. v.), and Barye, the great animal sculptor. Strictly speaking, S., as an independent art, had no existence in England till the appearance of Flaxman (q. v.). His chief followers have been Westmacott (q. v.), Chantrey (q. v.), Ramsay (q. v.), Gibson (q. v.), Foley (q. v.), and, in our own day, Landseer (q. v.), Woolner (q. v.), Boehm, Stevens, Leighton (q. v.), and Brodie (q. v.). America has been singularly prolific of gifted sculptors, among whom are Greenough, Hiram Powers (q. v.), Crawford, Henry Brown, Palmer, Thomas Ball, and Quincy Ward. See Overbeck's *Griech. Künstler* (2 vols. Leip. 1857-58), Cicognari's *Scultura del suo Risorgimento in Italia* (9 vols. Prato 1823); Viollet-le-Duc's *Dictionary of Architecture* (1866, vol. iii., art. 'Sculpture'), Symonds' *Renaissance in Italy* (Lond. 1877).

Scurvy, or **Scorbutus**, is a disease which essentially consists in a depraved condition of the blood, caused by abstinence from a proper vegetable diet. It has proved very fatal both by land and sea, but it is pre-eminently a sailor's disease. Dr. Guy says—'S. alone has sufficed to place a well-manned vessel at the mercy of the winds and waves. Witness Anson's own ship, the *Centurion*, in 1742, when the crew were so weakened by it that had the ship been compelled to keep the sea a few days longer it could not have been brought to anchor at Juan Fernandez, but must have gone adrift in the Pacific, the survivors perishing miserably, as happened to a Spanish vessel under similar circumstances. Or take the figures that express the mortality in Anson's fleet. Out of 961 men, 626 deaths in nine months, or very nearly two out of three! And this was no rare or exceptional occurrence, for such things had happened earlier, and did happen in later times. Thus Sir Richard Hawkins, the great navigator of the age of Elizabeth and her successors, said that in the course of twenty years "he had known of 10,000 seamen having perished by S. alone." Even so late as 1780, Sir Gilbert Blane found that a fleet manned with between 7000 and 8000 seamen had in one year lost one in every seven.' At the present time S. can hardly be said to exist in our army or navy; but it is still to be found to a considerable extent in the merchant service, partly owing to the carelessness of captains and owners of ships, and partly from the bad quality of the lime-juice supplied.

The important discovery that lime-juice prevents S. was probably due to John Woodfall. At what period the truth dawned upon men's minds we do not know, but certainly as early as 1617 John Woodfall, master in surgery, knew that lemon-juice was the best of all remedies for S., and commended it accordingly; but, strange to say, this important fact was forgotten or overlooked for more than a hundred years. About 1770, Lind revived and diffused a knowledge of it; but nearly another quarter of a century was to elapse before our navy was supplied with it. This important step was taken in 1796. Dr. Wynter Blyth says, 'The practical ways of keeping men free from S., whether on land or sea, is to see that, where they can be obtained, fruits and fresh vegetables be used at each meal. In war it is better to utilise any plant that is not injurious rather than have no vegetables at all. . . . Each soldier or sailor should drink an ounce daily of lemon-juice, which should be swallowed

as soon as distributed. . . . Vinegar should be an essential part of the rations, and it is a good plan to issue little packets of the citrates or tartrates of potash, with instructions for use.' Notwithstanding the well-known prophylactic qualities of lime-juice, the most serious consequences frequently arise from culpable neglect. In 1875 two British vessels arrived at San Francisco, the crews being decimated by S.; and the comparative failure of the recent Arctic Expedition under Sir George Nares was, in great measure, due to neglect regarding the lime-juice issue.

Dr. Garrod views S. as essentially due to the want of potash salts in the blood, through the food being deficient in them. The symptoms come on gradually, with weakness, anxiety, a sallow muddy complexion, a foul breath, and the appearance of blotches on the legs called 'the purples.' The gums become swollen and spongy, bleed on being touched, and resemble that seen when a patient is salivated. Wandering pains are felt all over the body, and the temperature is lower than normal. As the disease advances the teeth rot from the sockets, and hæmorrhage takes place from the mouth, nose, stomach, and intestines. The last stage is attended with great debility, and the petechiæ, developing into ulcers or ecchymoses, form on the lower extremities.

Scurvy-grass (*Cochlearia*) is a genus of cruciferous perennial herbs with entire or pinnate leaves, small white flowers with short-clawed petals; short, equal, spreading sepals; pods oblong or globose, with turgid reticular valves, and often imperfect septum; tubercled seeds in two rows. It is a littoral plant with smooth, fleshy, clasping stem-leaves, and cordate-orbicular or ovate radical leaves, which are esteemed a valuable antiscorbutic, hence the name. *C. officinalis*, one of the 'Saline Plants' (q. v.), also thrives on mountains, a form of it being found in Scotland at a height of 4000 feet.

Scutage. See ESCUAGE.

Scutari (anc. *Scodra*, Slav. *Skadar*, Turk. *Ishkodra*), capital of a vilayet of the same name in Northern Albania, on the river Bojana, near where it issues from Lake S., and 17 miles from the Adriatic. S. is the seat of a Greek bishop, and has a castle occupied by a Turkish pasha. The chief industries are the manufacture of weapons, weaving, and the exportation of fish, taken from the adjacent lake, which is 20 miles long. S. also trades in leather, oil, maize, wheat, wool, timber, wax, and fruits. There is considerable transit trade. The surrounding country is fertile. In 1876 there entered 4 steamers and 104 sailing-vessels, with a tonnage of 3751, and cargoes valued at £126,103; there cleared 1 steamer and 93 sailing-ships, with a tonnage of 2901, and cargoes valued at £64,399. Pop. 40,000. By the Treaty of Berlin (July 1878) the Turks are permitted to raise fortifications around S., but on the rest of the Bojana neither they nor the Montenegrins may do so.

Scutari (Turk. *Uesküdar*), a town of Asiatic Turkey, on the Bosphorus, opposite Constantinople. It slopes gradually up from the shores of the Bosphorus, and to the S. and S.W. are extensive cemeteries shaded by cypresses, where the Turks of Stamboul prefer to be buried, that their graves may not be desecrated in the day when the Giaour again rules in the city of the Cæsars. S. with its twelve mosques and extensive ruins has a striking appearance from the sea. There is also a summer palace of the Sultan's, and a barrack for the guards, as well as numerous khans for the many caravans which start here. Some manufactures of silk and cotton are carried on. The barracks were used as a British hospital during the Crimean War, and here it was that Florence Nightingale (q. v.) toiled. S. is on the site of the ancient Chrysopolis. Pop. 50,000.

Scutcheon is the shield or metallic plate attached to the key-hole of doors, and through which the key passes. The term is also applied to a knight's shield—properly Escutcheon (q. v.).

Scutching. See FLAX-DRESSING and COTTON-SPINNING.

Scyll'a and Charyb'dis, a rock and whirlpool in the straits of Messina, frequently referred to in ancient writings. S. is a rock on the Italian coast about 200 feet high. It is occupied now by a castle. The situation of C. is more uncertain. All ancient writers agree in representing it as a whirlpool, but no whirlpool exists opposite S. Either they intended the whirlpool of Garofalo, 10 miles down the straits, or else some of

the currents common in the neighbourhood of S. At anyrate, they described S. and C. as directly opposite each other, and the difficulty of navigating between them became proverbial in antiquity. Homer represents S. as a monster—above a virgin, below a beast—with twelve feet, six mouths, &c. C. was a voracious monster opposite. The myths were varied in later times.

Scythe (Icel. *siga*, 'a sickle'), an implement having a long curved blade of steel, fixed nearly at right angles to a long, crooked handle. It is used in mowing and Reaping (q. v.). Two S.-like weapons of war, called the *bill* or *war S.*, and the *glave* or S. knife, were in use from the 13th to the 16th c. The S. blade, slightly straightened, was simply fixed to a wooden handle, and in a line with it. The *bill* has its point curving from the cutting edge, the *glave* to it.

Scyth'ia, a term of vague import, and more ethnographic than geographic. The Scythæ, or *Scoloti* as they called themselves, are mentioned in early Greek writers, especially Herodotus, as a nomadic people drinking mare's milk (*galactophagi*, *hippenolgi*), and living in a country where gold was found. Their habitat was N. of the Euxine, between the Don and the Caspian. In one direction they penetrated towards the Danube. They also entered Asia Minor (628), but were expelled by Cyaxares. In Ptolemy's time travellers had found many Scythian tribes in Asia, and he applied the name S. to the whole of W. and Central Asia. The identification of the Scythians with some modern people was long a variously-solved problem. The weight of evidence now strongly favours the view that they were the Turcoman or Tartar race.

Sea is the general name for the continuous mass of salt water which covers the greater part of the earth's surface. Over this large expanse, especially in the equatorial regions, evaporation is constantly taking place, and the moisture-laden atmosphere, cooled by radiation, or by indraught of a cold current, or by translation to a cooler region, precipitates this vapour as dew, rain, snow, or hail. The S. is the great store from which the solar heat draws up the vapours which subsequently descend to water the earth, and it is the great reservoir to which these waters ultimately return by means of the various river courses and channels. The various aspects of this grand cycle of operations are noticed under the special articles CLIMATE, RAIN, RIVER; while the great movements of the deep are discussed under CURRENTS, TIDES, and WAVES. Here it is purposed, after glancing at the nature of S.-water, its density, temperature, depth, &c., to consider briefly its action as a geological agent.

The saltness of the S. is familiar to all. The saline substances which it holds in solution are brought to it mainly through the dissolving action of the rivers and streams, which ultimately mingle their land-travelled waters with the ocean. This saltness is wonderfully uniform throughout, a result due to the interdependence of density and saltness, so that the equilibrium, once destroyed, is speedily restored through consequent circulation. The chief cause of this salinity is the presence in solution of chloride of sodium or common salt, as much as 2.7 per cent. by mass being this compound. The density of S.-water is 1.027 at 60° F., the density of distilled water being unity. Besides increasing the density, the presence of saline substances has the effect of lowering the freezing point of S.-water to 28°.4 F. Temperature readings show a decrease of temperature with increase of depth. In the Atlantic and Pacific a stratum of cold water, at a temperature of 35° F., lies along the bottom. This stratum Sir Wyville Thomson regards as derived mainly from the Antarctic seas, except perhaps in the North Atlantic, where there is an indraught from the Arctic Ocean. This steady diminution of temperature as one descends is an important factor in the distribution of life in the ocean, and one of the results of the late *Challenger* expedition is the proof that life exists at all depths. Deeper than 100 fathoms the ordinary surface disturbances on the S. are hardly perceptible; so that the destructive action of the S. must cease at that depth, and be very feeble at depths much less than this. Along the shore, however, the wearing action of the waves is very evident. The angular masses severed from the parent cliff by frost and wind are gradually rounded by friction till all trace of splinter has vanished. The spheroidal boulders, pebbles, and gravel which strew the beach, and the sand of the beach itself, bear

witness to the disintegrating action of the S. More important, however, is the ocean as a conservative agent. The gravel, sand, and mud which are borne down by rivers, gradually sink to the bottom, and accumulating there become consolidated through time, and form the basis of a new continent; while far out in the great depths the calcareous ooze is gradually increasing by the constant accessions of the Globigerina shells, which pour like rain through several miles of salt water till they reach the bottom. And thus the S., though it acts by denudation along its shores, is more than making up for this by depositing along its rugged bottom the matter which the rivers and streams of the earth have brought in suspension to it. See Sir Wyville Thomson's *The Depths of the S.* (1873), and Huxley's *Physiography*.

Law Affecting Sea and Sea-shore.—It is a question which has been much discussed whether the sea is open to all, or whether it may not be appropriated by particular nations. In the United Kingdom, while it has been admitted that the ocean cannot be appropriated, it is held that the sea within three miles of the shore is British dominion. But the point is obscure; and in the trial of the captain of the German *Franconia* for the manslaughter of one of the passengers of the *Strathclyde*, in a collision which took place off Dover, 17th February 1875, a contrary decision was come to by the supreme court. The shores of the United Kingdom are *inter regalia*; that is, they are held by the Crown for behoof of the people. This lordship comprehends the right to free navigation, to fishing, to taking wrecks, to forbid passage to enemies, &c. The *shore* is the space between high and low water-mark. It has been decided in England that land gained from the sea by sudden recess goes to the Crown, but that which is gained gradually goes to the neighbouring proprietor. (See ALLUVION.) Wilful injury to a seabank is felony by statute.

Sea-Devil. See ANGLER-FISH and LOPHIUS.

Sea-Dragon, a name given to various Teleostean fishes, such as the *Pegasus draco* belonging to the *Lophobranchii* (q. v.); and to the Dragonets (*Callionymus*), allied to the Gobies. They occur in the seas of the E. Archipelago. The Pegasus is a fish whose wide breast and large pectoral fins have suggested the name S.-D. *P. natans* is another species, with smaller fins.

Sea-Grape (*Ephedra*) is one of the three genera of the gymnospermous order *Guttaceæ*, the other two being *Gnetum* and *Welwitschia*. The various species are shrubs destitute of foliage leaves, with long, slender, cylindrical, green-barked branches; at the joints of the stem are two opposite minute leaves, which grow together into a bidentate sheath, and from their axils spring the lateral branches.

Seaham Harbour, a seaport of Durham, founded in 1828, is 6 miles S. of Sunderland, and forms the terminus of three railways. The chief buildings are the Perpendicular church of St. John (1841), a Congregational chapel (1856), a Catholic church (1870), the Londonderry Literary Institute, in Grecian Doric style (1855), a Gothic infirmary (1849), and the Harbour and Colliery Office. The harbour consists of a tidal basin, one dry and two wet docks. S. H. depends for its prosperity mainly on the coal trade. Bottle-works employ 200 hands, and there are also anchor and chain works, an iron foundry, and chemical works. Pop. (1871) 9031.

Sea-Horse. See HIPPOCAMPUS and LOPHOBANCHIA.

Sea-Kale (*Crambe maritima*), a cruciferous perennial, with strong, deeply-penetrating roots, native of the sandy and shingly sea-coasts of Europe (including Britain) and W. Asia. The leaves are broad, wavy, and toothed, and are covered with a glaucous bloom; the white flowers have a strong, honey-like smell; and the one-seeded pods are roundly ovoid, about $\frac{1}{2}$ in. long. S.-K. in a wild state was apparently known to the Romans as an esculent, and used by them in long sea voyages. It has been cultivated in England about 200 years, but was not brought into general notice until 1767, and was introduced from England to the Continent as a table vegetable. It has now become common in gardens, the blanched young shoots and leaf-stalks being the part eaten. See CRAMBE.

Seal, the name given generally to animals belonging to the section *Pinnipedia* or *Pinnigrada*, of the order *Carnivora*, class *Mammalia*. The Walrus (q. v.) is also included in this section, in which the limbs are converted into swimming paddles.

There are two groups or families of seals—the *Phocidæ*, or seals proper, which have no outer ear, and the *Otaridæ* or eared seals, which include the sea-lions, sea-bears, sea-elephants, and other forms. The *Phocidæ* have the hind limbs stretched out behind and in the long axis of the body, so that, along with the hinder extremity of the body they serve as an efficient propelling organ. On land the seals are awkward in their gait. They support themselves on their paddle-like forelimbs, and waddle along in an ungainly fashion. In the water they are exceptionally agile and active, swimming and diving, and securing the fishes on which they prey with the utmost ease and grace. They have five toes in each foot, and external nails on the paddles. Incisor teeth, canines, and molars are developed, and the dentition resembles that of *carnivora* generally. The greater part of the fore-limb is buried in the integument, so that only the distal part of the limb is used as the paddle. The orifices of the ears can be closed, like the nostrils, at the will of the animal. The skin is provided with a thick layer of blubber or fat, and there is an upper and under fur. The common S. has six incisor teeth above and four below; two canines in each jaw; and ten molars and premolars above and below. Seals as a rule are intelligent inoffensive animals. In aquaria they become exceedingly tame, and recognise their keeper. When whistled upon they attend the signal, and allow themselves to be petted at will. The *Phocidæ* inhabit the seas of Arctic and temperate climates. The Greenlanders find in them a store of useful materials, and utilise the skin, fat, bones, and intestines. A valuable oil is obtained from the blubber, and ships, specially intended for the S.-fishing, sail regularly to the Arctic seas from various European and American ports. Dundee and Hull are notably the British ports whence the S.-fishers sail; in America, the Alaska Company have, since 1870, leased St. Paul and St. George, the largest of the Aleutian islands.

The Common S. (*Phoca vitulina*) is familiar on many British coasts, and is a dreaded foe of the salmon, herring, and other fishes. Its average length is about 4 feet. The fur is a greyish brown, mottled with black. The Harp S., or Saddleback S. (*Phoca Greenlandica*), occurs in the Arctic Ocean, and has a wide distribution. On the back there is a black or tawny mark, resembling a harp in shape, the body fur being grey. This S. forms the chief object of pursuit by the S.-fishers. Its average length is 5 feet, and a full-grown specimen weighs from 200 to 230 lbs. or more. The *P. barbata*, or Great S., is found in S. Greenland, and measures from 8 to 10 feet in length. The Grey S. (*Halicharus griseus*) measures between 8 and 9 feet in length, and occurs on the coasts of Iceland and Norway. Another well-known S. is the *P. fatida*, so named because of the disagreeable odour emitted by the skin of old males. The *P. Caspica* is a native of the Caspian Sea. Other seals belonging to genera differing from the genus *Phoca* are the Monk S. (*Monorhynchus monachus*) of the Mediterranean Sea; the Crested S. (*Cystophora cristata*) of Greenland seas, in which the nose of the males has a curious distensible sac. This latter species may attain a length of 10 or 12 feet. The Sea-Elephant is the *Morunga proboscidea* of the Antarctic seas, an animal measuring from 20 to 30 feet in length, the males having a proboscis-like nose. The Leopard S. (*Leptonyx Weddellii*) has leopard-like markings on the fur. They occur off the S. Orkney Islands and on the coast of E. Polynesia. The S.-fisheries begin in March, and April is usually the busiest month. One tun of S.-oil is estimated to represent the blubber of 100 seals; the skins selling at about 5s. each. In 1870, nine Dundee vessels obtained 90,450 seals.

The *Otaridæ*, or Eared seals, have a small outer ear, and in their structural relationship present a much nearer affinity to the Bears than the ordinary seals do. The neck of the *Otaridæ* is much better defined than that of the common S., and they are able to move about on land with greater ease, owing to the greater freedom of the forelimbs. In their distribution the Eared seals are found in the Southern Seas, and do not occur in the Atlantic save in its most southern parts. The best-known forms are the Sea-Bear (*Otaria ursina*) and the Sea-Lion (*O. jubata*). Two of the latter have bred in captivity at the Brighton Aquarium. These seals attain a length of from 10 to 15 feet. They live in colonies, and the males engage in desperate fights for the possession of the females, each of the old males having a retinue of female seals attached to him. It is disputed whether all the *Otaridæ* possess the famous under fur which forms the valued 'sealskin.' Some observers deny that the sea-lions have it, and

allege that its absence in these animals constitutes the point of difference from their neighbours the fur seals. The Otariidæ include the sea-bear already mentioned, found almost entirely at the Prybilor Islands in Behring's Sea. This is a true fur-S. In the *O. stelleri* or sea-lion found in the islands of St. Paul and St. George, and on the E. coast of Kamtschatka to the Kurile Isles, the under fur is scanty and useless as a commercial article, but a superior leather is made from the skin. *O. jubata* is another of the sea-lions with little or no under fur; whilst *O. falklandica* has a rich under-fur. In the New Zealand seas there is a species named *O. hookeri*; and on the E. coast of Australia occurs the 'Cowled S.' (*Neophoca lobata*). In 1877 there were imported into the United Kingdom 763,757 skins, valued at £246,533.

Seal-Engraving. The engraving of seals, when they are cut in hard agate stones, is performed with the same implements and by like processes used in cutting cameos and intaglios in similar stones. (See GEMS, ANCIENT.) The larger official and other seals which are cut in steel, &c., are prepared after the manner of dies. See DIE-SINKING.

Sealing-Wax, a preparation used for securing folded papers and envelopes, for sealing legal and other documents, and for attaching the impression of a seal to many articles where certification by such means is required. Ordinary red S.-W. is made of a pure bleached lac, 4 parts, to which when cautiously melted are added about 1½ parts of Venice turpentine and 3 parts of vermilion. When thoroughly incorporated the mixture is cast into moulds of the size in which the sticks are required, or it is rolled out on a marble slab. In inferior qualities a proportion of common resin and red lead is used, and black and other colours are produced by substituting appropriate pigments. Bottle wax is made of a mixture of resin and bees-wax with Venetian red, red lead, or other colouring matter.

Sea-Lion. See SEAL.

Sealkote (Sialkot), the chief town of the district of the same name in the Punjab, British India, 72 miles N.E. of Lahore. Pop. (1868) 25,327. It is a very ancient city, commanding the Jammu valley. The fort has existed for 1000 years, and gave shelter to the European residents during the Mutiny of 1857. There are several Hindu, Sikh, and Mahomedan shrines. The trade is considerable, and there are manufactures of paper and cloth. The cantonments lie N. of the town. — The district of S., which lies at the foot of the Himalayas between the rivers Chenab and Ravi, has an area of 1955 sq. miles; pop. (1868) 1,005,004. It is well watered by rivers and canals; the crops are wheat, barley, rice, and sugar-cane. In 1860 a Belfast Flax Company was unsuccessfully started. There are manufactures of cotton, iron, and leather. The total annual value is estimated at £360,000. The exports are wheat, sugar, and cotton; the imports, piece-goods and salt.

Seamen, Law Regarding. The Act 17 and 18 Vict. c. 104 amends and consolidates the laws affecting seamen and shipping. It provides penalties against any act or omission of duty on the part of any one, by which the safety of the vessel is endangered, or by which 'the life or limb' of any one on board is imperilled. It provides that a seaman's right to wages and provisions shall commence either at the time when he begins to work, or at the time specified in his agreement for beginning, whichever happens first. No seaman can, by the Act, forfeit his lien over the ship for his wages; and any stipulation for abandonment of his wages, or share of salvage, is declared illegal. It is also declared that no seaman or apprentice shall be entitled to wages for any period during which he unlawfully refuses or neglects to work when required. Provisions are also made for regular periodical payment of a seaman's wages, and for their being sued for summarily, in case of non-payment.

Sea-Mouse, the name applied to species of the genus *Aphrodite*, a genus of *Errantia* or marine worms. In this genus the body is oval, and is covered by a series of *elytra* or shield-like plates, beneath which the *branchiæ* or gills are included. The bristles or *setæ* fringing the body are long, and emit iridescent hues of great brilliancy. *A. aculeata*, *A. hystrix*, and *A. borealis* are British species.

Sea-Pike. See GARFISH.

Search of Encumbrances, a term of Scotch law denoting the process by which the existence of any burden affecting real

estate in that country may be ascertained. The Scotch system of registration of deeds of mortgages, called in Scotland *heritable bonds*, enables any one, on payment of a small fee, to discover if any burden exists upon any particular real estate.

Search-Warrant is the written authority which may be granted by any magistrate to search the premises of any one suspected of secreting stolen goods, and for taking possession of these if found. No S.-W. will be issued without reasonable ground of suspicion being averred by the oath of a respectable witness.

Sea-Serpent, a marine monster, real or imaginary, which has been the subject of more copious description and discussion than any creature whose existence is beyond doubt. Those who wish to read what can be said from a 'scientific' point of view on behalf of this formidable mystery should consult the essay on the 'Sea Serpents of Science' in Dr. Andrew Wilson's *Leisure Time Studies* (Lond. 1878).

Sea-Sickness is a distinctive variety of vomiting, preceded by vertigo and headache, with a peculiar feeling of sinking and distress in the region of the stomach, depending on the exposure of a susceptible person to the motion of rolling water in a vessel or boat. The vomiting is usually accompanied with a convulsive heaving of the stomach, a profuse cold sweat, and an indescribable feeling of prostration which renders the patient almost indifferent to life. The susceptibility to S.-S. varies in different persons. Infants and aged persons possess a comparative immunity; while women, as a general rule, suffer more than men. Some people, however, never suffer from it; others only on their first voyage; and others on every voyage they undertake. In the great majority of cases, S.-S. continues for only a few days; but some suffer almost continuously throughout the voyage. According to Dr. Althaus, persons with a strong heart and a slow pulse generally suffer little from S.-S.; while irritable people, with a quick pulse and a tendency to palpitation, are more liable to be affected. He says—'As a rule, the French and Italians, being of a more irritable temper, suffer most from the disorder, the Germans less, and the English least.' Dr. Chapman considers that the motion of the vessel causes an accumulation of an undue amount of 'blood in the nervous centres along the back, and especially in those segments of the spinal cord related to the stomach, and the muscles concerned in vomiting.' He proposes the cure of S.-S. by lessening the amount of blood in the whole of the nervous centres along the back, this being accomplished by lowering the temperature of the spinal region by the local application of ice, contained in spinal ice-bags. He also recommends the swallowing of small lumps of ice, which, 'brought into contact with the peripheral ends of the nerves of the stomach, will act on the same principle as it does when applied to the spinal region.'

Those susceptible to S.-S. should maintain the horizontal position as long as possible, and as nearly as possible in the centre of the ship's movements; and the compression of the stomach by means of a broad belt will sometimes afford relief. The more useful remedies, in cases of S.-S., are camphor, tincture of capsicum, chloroform, and creosote. A few drops of chloroform on a lump of white sugar very frequently gives relief, and dilute hydrocyanic acid may be administered in a similar manner. Sometimes there is great reduction of strength from want of alimentation, owing to the incessant vomiting, and in such cases arrowroot and beef tea in small quantities should be frequently administered. See Dr. Chapman, *S.-S., its Nature and Treatment* (Lond. 1864).

Seaside Grape (*Coccoloba uvifera*) is a small tree belonging to the natural order *Polygonaceæ*, and has obtained its name from the perianth which surrounds the ripe fruit becoming pulpy and of a violet colour. The fruit has an agreeable sub-acid flavour. The hard and handsome wood yields a red dye, and by evaporating a decoction of the leaves, wood, and bark, the astringent drug known as Jamaica kino is obtained.

Sea-Slug, a general name applied to certain *Gasteropodous* Molluscs, and also to the Sea-Cucumber or *Holothuria* (q. v.).

Seasoning is anything added to food to increase its relish. The 'tastiness' of food has a considerable influence on the digestive action of the stomach, and thus indirectly increases its nutritive value.

Sea'sons, the name given to the four portions into which the year naturally divides, and which are distinguished from one another by certain characteristics of temperature, moisture, vegetation, &c. The great cause of the annual variation of climate which is marked by the sequence of the S., as indeed of all variations of climate, is the influence of the sun. Every diurnal rotation of the earth as it presents in succession each part of its surface to the sun is accompanied at any given place by a periodic variation in temperature. An annual periodicity also exists as the earth in its revolution is now nearer to, now farther from, the central orb; but this variation is slight compared with the variations which constitute the seasons, and which are directly due to the inclination of the earth's axis to the ecliptic or plane in which the earth revolves round the sun. Were the earth's axis perpendicular to the ecliptic, the line of separation between light and darkness upon the earth's surface would be a great circle passing through the poles, day and night would be equal at every locality all the year round, and the altitude of the sun at noon would be constant for any given place. The inclination of the axis, however, and its constancy of direction, permit the circle of separation between light and darkness to pass through the poles only twice during the year. These occasions are known as the equinoxes, and occur about the 21st of March and the 21st of September. Between March and September the earth is so situated that its N. pole is directed in towards the sun. At all places in the northern hemisphere, then, the day is longer than the night, and at the region surrounding the N. pole there is no night—the sun never sets. Exactly the converse holds at the S. pole, where there is no day. Between September and March, however, the conditions are reversed—the southern hemisphere enjoys its summer, the northern hemisphere endures its winter. When it is summer in the N. it is winter in the S., and spring in the N. corresponds in time with autumn in the S. Consequently, Great Britain and New Zealand are always complementary in their S. Though there are four S. specified by name—spring, summer, autumn, winter—it is impossible to say where the one ends and the other begins. Each insensibly passes into the next. It is customary, however, to allocate to each three definite months—thus, in the northern hemisphere, spring has February, March, April; summer has May, June, July; autumn has August, September, October; and winter has November, December, January.

Sea-Squirrels. See ASCIDIÆ.

Sea-Urchin. See ECHINUS.

Sea-weed and Sea-Wrack. See ALGÆ, FUCACEÆ, and WRACK.

Sea-Wolf (*Anarrhichas lupus*), a species of Teleostean fishes allied to the Blennies. It may attain a length of from 4 to 7 or 8 feet. The colour is a brownish grey above, with brown stripes, and white below. In its habits this fish is fierce and predatory. It has a formidable array of teeth, and is said to attack the fishermen on being taken in their nets. The S.-W. occurs on the British coasts, in the Mediterranean Sea, and in southern waters.

Sea-Surgeon, a Teleostean fish—the *Acanthurus chirurgus* of naturalists—found in the Atlantic Ocean and Caribbean Sea, and deriving its name from the lancet-shaped spine on each side of the body, and at its tail-extremity. The length is from 12 to 18 inches. The colour is a brown of varying shades.

Sebaceous Glands, the name given to the minute sacs lodged in the lower layer of the *dermis*, or true skin. Each consists of a sac-like extremity from which a little duct leads, opening either on the surface of the skin or into the *follicles* of the hairs. The S. G. are most numerous in the face and scalp, but they exist in large numbers in the skin surrounding the nose, mouth, anus, ears, &c. None occur in the palms of the hands and soles of the feet. The sac-like extremity consists of from five to twenty little divisions. The largest S. G. are those of the eyelids, otherwise named *Meibomian glands*. The function of these glands is that of secreting *sebaceous matter*, a secretion of use in keeping the skin moist, and which also contributes to the nourishment of the hairs.

Sebastian, St., according to the acts of his martyrdom, was born at Narbonne in the end of the 2d c., and educated at Milan. Although a Christian, he entered the Roman army, but it was with the object of doing all he could for the Christians, who were suffering persecution at the time under the Emperor

Diocletian. He rose to high favour under the Emperor, and the Pope gave him the title of 'Defender of the Church.' At length he declared the fact of his being a Christian, and the Emperor, after trying in vain to induce him to renounce his religion, condemned him to be put to death. His body, which had been transfixed with arrows till life was apparently extinct, was carried to the house of a Christian lady, where he recovered. In spite of the entreaties of his friends S. again appeared in public, and professed his adherence to Christianity; and he was now beaten to death with clubs, on the 20th January, 288. His body, which had been flung into one of the sewers of the city, was discovered by an apparition, and carried to the catacomb which still bears his name. See the Bollandist *Acta Sanctorum*.

Sebastia'ni, François Horace Bastien, Comte, born at Porta d'Ampugnano, Corsica, November 10, 1772, was the son of a tailor. Educated for the church, he entered the French army at the age of seventeen, and in 1799 was promoted to the rank of brigadier by Moreau on the field of Verona. He contributed to the victory of Marengo in 1800, and after the peace of Amiens undertook a mission to the East. In 1805 he fought against Austria, entered Vienna at the head of Murat's vanguard, received wounds at Austerlitz, and became a general of division. In May, 1806, he did much to strengthen the hands of Selim III. against the British fleet, which he forced to run the blockade through the Dardanelles. At the head of the 4th corps he joined in the invasion of Spain (1809), and took Ocaña, Granada, and Malaga, conquering also at Baza. In the Russian campaign of 1812 he commanded the vanguard of the army, and was one of the first to enter Moscow. In 1813 he was wounded at Leipzig, and during the campaign of 1814 he behaved with intrepid bravery. After the battle of Waterloo he was one of the commissioners sent by France to negotiate with the allied sovereigns. Under Louis Philippe he held the portfolio of naval affairs, and afterwards that for foreign affairs; and he likewise became ambassador to Naples in 1833, and to London in 1835. In 1840 he was made a marshal of France. S. died at Paris, July 20, 1851.

Sebastop'ol (Gr. *Sebastopolis*, 'august city'), a town of Russia, government of Taurida, on the S.E. coast of the Crimea, 352 miles by rail from Lezovo. It stands on the S. side of a splendid bay which runs from E. to W. for 4½ miles, with an average breadth of half a mile. The different inlets in this bay are called the Quarantine, Artillery, South, and Dockyard Harbours. The town of S. stands between the Artillery and South Harbours. The upper part is inhabited by the wealthy, the lower by the industrial classes. S., which occupies the site of a Tartar village called Akhtiar, was founded in 1783 by Catharine, and during the reign of Nicholas it was strongly fortified under the direction of Colonel Upton, an English civil engineer. It was intended to be the headquarters of a great Black Sea fleet, and was supplied with arsenals, magazines, barracks, and forts, chief among the latter being Forts St. Nicholas and St. Michael. During the Crimean War it was besieged by the French and English allies for eleven months, from 9th October 1854, and after a brilliant defence by General Todleben, was successfully stormed 8th September 1855. The great harbour fortifications which existed at the time of the siege were begun in 1834, but the corresponding land defences were only then in course of construction, and the work of strengthening the entrenchments was carried on simultaneously with the siege. After it had fallen, S. was dismantled and almost deserted. It long remained in this condition, but after gradual restoration it was declared a commercial port in 1875, and is now (1878) the second corn-granary in S. Russia. Some wine is also exported. The railway to Lozovo was opened in January 1875. The progress of S. has since been rapid. Much of the town has been rebuilt; the fortifications have been laid out as boulevards; and waterworks have been constructed. The Russian Memorial Church (1856-70) is the finest religious building in S. Russia, with a pavement of granite from the ruined docks, grey marble walls, and a memorial chapel containing some 200 portraits of the chief actors in the war. The exports in 1873 valued 27,114 roubles; the imports, 599,679 roubles. Pop. (1853) 40,000; (1856) 6000; (1876) 13,259. By the principal clause of the Treaty of Paris (1856), Russia was debarred from maintaining a naval force and arsenal in the Black Sea, but in November 1870 Prince Gortschakoff issued a circular repudiating these conditions.

Seben'ico, a town of Austria, in the crown-land of Dalmatia, 40 miles S.E. of Zara, connected with the sea by a narrow canal, 3 miles long. It is surrounded by walls and guarded by forts, and has a cathedral in the Italian-Gothic style, built in the 15th c. It trades in rosoglio and wine. Pop. (1869) 6132.

Sebes'ten, **Sebes'tan**, or **Sepi'stan**, are names applied to *Cordia Myxa* (*Boraginaceæ*), a medium-sized tree, cultivated in India, and extending through the Eastern Archipelago to Queensland. The young fruit is used as a vegetable and a pickle; when ripe the viscid pulp and nut-flavoured kernel are also eaten. The wood is used for a variety of purposes, the bark is made into rope, and the leaves serve as plates.

Secchi, Angelo, an Italian astronomer and meteorologist, was born at Reggio, June 29, 1818, and entered the order of the Jesuits in 1833. After holding for some years the chair of physics in Georgetown College, Washington, he returned to Italy, and in 1850 became professor of physics in the Collegio Romano at Rome. When the papal states were finally taken out of the hands of the Church, S. was offered the chair of astronomy in the new Roman University, which he accepted, but was ultimately compelled to resign in obedience to the command of the chief of the Jesuits; and even the efforts of the king to effect a compromise, so as to give S. ample opportunity for the carrying out of his astronomical researches, were unsuccessful. He devoted himself chiefly to the study of the sun's surface, and materially added to our knowledge of its constitution by his spectroscopic observations. S. was one of the observers of the total eclipses of 1860 and 1870; and in 1867 received the great French prize of 100,000 francs for his labours. He died February 26, 1878. His chief work, *Le Soleil* (Par. 1870; Ger. 1872), details the latest solar discoveries. His numerous memoirs upon subjects in the various branches of physics and meteorology attest his scientific grasp of mind and his rare industry. In 1878 there appeared a German translation of his work on the Fixed Stars, and his *Meteorologia Romana*, published by the Italian Government.

Secession Church. See UNITED PRESBYTERIANS.

Sec'ond, in horology and angular measurement, is the sixtieth part of a minute. The corresponding interval of time was called by the Romans *scrupulum secundum*, the scrupulum being equivalent to the minute.

Secondary Rocks, a general term applied to all the stratified rocks between the top of the Permian Formation and the base of the Eocene, and including, therefore, the Trias, Lias, Oolitic, and Cretaceous Formations. It is synonymous with the term Mesozoic. The Secondary Period as a whole is remarkable for the predominance of cycads and allied plants; for the great abundance of reptiles; for the first appearance of birds, whose footprints are found in Triassic strata in Connecticut, and of which the first indubitable species, *Archæopteryx macrura*, occurs in the lithographic slate of Solenhofen; and, lastly, for the dawn of mammalian life, in the shape of the Triassic genera *Dromotherium* and *Microlestes*.

Second'ing (in the army). A military officer accepting civil employment under the crown, and retaining his rank while losing his pay, is said to be seconded. At the end of ten years he must either return to regimental duty, permanently retire, or, if not entitled to retire, resign his commission.

Sec'ond Sight, a power ascribed by Highland belief to certain persons of foreseeing coming events, is fully described in the last 29 pages of a scarce book by John Aubrey, entitled *Miscellanies, viz., Voices, Marvels, Knockings, &c.* (Lond. 1696). Aubrey's somewhat conflicting information, drawn from an anonymous 'learned friend in Scotland,' from a minister living near Inverness, and from a gentleman's son in Strathspey, a student in divinity, comes to this:—Many instances of S. S. can be given by the confession of such as are skilled in that faculty. It relates solely to things future, which are to happen either shortly thereafter or within three or four years, these things being only sad and dismal events, as 'murthers, drownings, weddings (?), burials, combates, manslaughters.' Such sights the seers, but none but themselves, behold visibly, seeing a gibbet or rope if a man's fatal end be hanging, or if drowning,

then water up to his neck. The S. S. is a burden very troublesome to its possessors, but as to whether these are necessarily ungodly, authorities differ. So also as to whether it comes by succession, by compact with the devil, or by converse with those dæmons called fairies, but 'when a woman hath it herself and is married to a man that hath it also, if in the very act of delivery the child be baptized, the same is free from it; if not, he hath it all his life.' Also it can be transmitted by a second-sighted person setting his foot on the foot of another who hath not the gift, while in the Isle of Sky any one that pleases may get it taught him for a pound or two of tobacco. The student adds that 'they generally term this S. S. in Irish *Taishitarangh*, and such as have it *Taishatrin*, from *Taish*, which is properly a shadowy substance, or such naughty a thing as can only, or scarcely rather, be discerned by the eye but not caught by the hands; for which they assigned it to *bogies* or ghosts, so that *Taishtar* is as much as one that converses with ghosts or spirits, or, as they commonly call them, the *fairies* or *fairy-folks*. Others call these men *Phissichin*, from *Phu*, which is properly foresight or foreknowledge.' Such was the belief concerning S. S. in the Highlands two centuries ago, and that it lingered long after Aubrey's day is testified by Martin's *Description of the Western Islands of Scotland* (1716; reprinted in Pinkerton's *Voyages*, vol. iii.), by Macleod of Hamir's *Theophilus Insulanus* (1763), and by the *Journey to the Hebrides* (1775) of Dr. Samuel Johnson, who himself 'came away at last only willing to believe.' Nay, in the present years of grace there are many persons living in the Highlands, more still in the Western Isles, who by their own account can see quite as far into futurity as any of their grand-sires. Instances of S. S. also occur among savage races, as when Mason Brown was met on the Coppermine River by the very Indians he was in search of, who told him their medicine-man had seen him coming and heard him talk; or when Captain J. Carver received from a Cree medicine-man a faithful prediction of the arrival next day at noon of a canoe with news. See Brenton's *Myths of the New World*.

Se'cret (Lat. *secreta*, scil. *oratio*, 'the secret prayer') is the prayer in the Mass (q. v.) which follows immediately after the oblation of the bread and wine, and which is recited by the priest in an inaudible voice.

Se'cret, Dis'cipline of the (Lat. *Arcani disciplina*), was the practice which prevailed in the early Church—from the beginning of the 3d c. to the 6th—of keeping secret from the uninitiated certain doctrines and rites of the Christian religion. The pagan practice with regard to their mysteries—e.g., the Eleusinian—is well known; and if it be considered that the early Christians were all converts from paganism, who would see nothing wrong in the principle of having mysteries, but only in having unholy ones, it is not difficult to see the reason for the origin of the practice in the Church. It is a fact, at any rate, that the terms used in the pagan mysteries were applied to the Christian institutions, particularly Baptism and the Lord's Supper. The mysteries, or the things which were kept secret from outsiders generally, and even from the Catechumens (q. v.), were the following:—1. The manner of administering Baptism, and 2. Confirmation. 3. The manner of celebrating the Eucharist (q. v.). 4. The ordination of priests. 5. The public liturgy or solemn prayers of the Church. 6. The doctrine of the Trinity, the Creed, and the Lord's Prayer were kept back from the catechumens till immediately before their baptism. See Bingham's *Origines Eccl.* (2d ed. 1726), Zezschwitz in Herzog's *Real-Encyclopædie* (new ed. Leip. 1877).

Sec'retary Bird (*Gypogergus secretarius*), a species of *Rap-torial* bird, found in S. Africa, and nearly allied to the Harrier (q. v.). It derives its popular name from the long feathers, which project like quill pens on each side of the head. The legs and tail are also long. The three front toes are short, the hinder toe rudimentary and elevated. The tarsi and toes are scaly, and the third, fourth, and fifth wing-quills are the longest. The S. B. is a destroyer of venomous snakes, and is accordingly encouraged and protected in S. Africa. The snakes appear to be killed by means of the strong feet and wings. The average length of the bird is about 3 feet, and the plumage is of a dull grey hue, the projecting head-feathers being black, and the central feathers of the tail grey. The S. B. is frequently domesticated in S. Africa.

Secretary of Embassy, the principal assistant of an ambassador. He receives his commission direct from the Crown, has high diplomatic privileges, and acts as *chargé-d'affaires ad interim* during the absence of his chief. In the case of an Envoy Extraordinary and Plenipotentiary, the secretary has the title of Secretary of Legation. The salaries attached to the office range from £500 to £1000.

Secretary of State, one of the highest officers of the Crown. The king's 'chief secretary,' or 'principal secretary,' in early English history had private access to the king, and prepared the business for the Privy Council, of which he was not, however, a member, in a room adjoining the council chamber. He had custody of the king's signet, and the assistance in his duties of four clerks. An additional principal secretary was appointed by Henry VIII., and since the reign of Elizabeth Secretaries of State by virtue of their office have been members of the Privy Council. For many years the number of Secretaries of State was restricted to two. A S. of S. for Scotland was temporarily (1708-42) appointed by Queen Anne, and one for America (1768-82) by George III. At this time the other two secretaries were called the Secretary for the Northern Department and the Secretary for the Southern Department, the northern and southern countries of Europe coming respectively into the spheres of their operations. The affairs of the colonies and of Ireland were administered by the elder of the two secretaries. In 1782 the secretaryship for America was abolished and the two Secretaries of State took the titles of S. of S. for the Home and for the Foreign Departments, colonial business falling to the share of the former. The Secretary of War was appointed in 1794 and the business of the colonies was transferred to his office in 1801. After the lapse of half a century these branches were separated, and a Secretary of State for India was appointed in 1858.

There are therefore at present five Secretaries of State, namely, those for the Home, Foreign, Colonial, War, and Indian Departments. They are always members of the Cabinet and of the Privy Council, and deliver up the seals of their office on a change of ministry. Though a separate sphere of work is assigned to them, they are all supposed to be capable of performing the duties of any of the others. Each has the management of the executive business of his department, subject to a reference to the Cabinet on affairs of importance, and is assisted by two under-secretaries, one permanent and the other connected with the administration. Not more than four may sit in the House of Commons, and as a rule three Secretaries of State are in one House of Parliament and two in the other. The salary of a S. of S. is £5000 a year, and of the Parliamentary Under S. of S. £1500. The S. of S. for the Home Department has charge of the privy signet office, where grants, letters, &c., to be signed with the privy signet are made out. He is responsible for the internal administration of justice so far as concerns the royal prerogative, the maintenance of peace in the country, the supervision of prisons, police, and sanitary affairs, and has the appointment of many judicial officers. He is the medium of communication between the Viceroy of Ireland and the Cabinet, and is responsible for the internal administration of Ireland. The Secretary for the Foreign Affairs conducts all correspondence with foreign states, negotiates treaties, appoints ambassadors, &c. The Secretary for the Colonies performs for these countries similar functions to those of the Home Secretary for the United Kingdom. The Secretary for War, assisted by the Commander-in-Chief, has the whole control of the army. The Secretary for India governs the affairs of our Eastern Empire with the assistance of a council of fifteen members.

The Chief Secretary for Ireland is not a S. of S., but is merely the chief secretary of the Viceroy. He is resident in Dublin during the Parliamentary recess, and has the assistance of an under-secretary.

Secret Bill of Sale. Frauds were frequently committed on creditors by this means; but 17 and 18 Vict. c. 36 enacts that no bill of sale shall be valid unless it, or a copy with other particulars specified, be filed within twenty-one days after date with the clerk of judgments, in the Queen's Bench division.

Secretion, the term applied to the function of separating and of elaborating from the blood a product of use in the living economy. The Liver (q. v.) is thus said to *secrete* or manufacture

bile; the Pancreas (q. v.) secretes *pancreatic juice*; the Salivary Glands (q. v.) secrete *saliva*; the Sebaceous Glands (q. v.) form *sebaceous matter*, and so on. The conditions of S. are three in number: (1) a due supply of healthy blood; (2) a *membrane* on which blood-vessels may ramify, and from which an *outlet or duct* may pass; and (3) special *secreting cells*, the latter being the active organs which are specially engaged in the work of separating the necessary products from the blood, and of elaborating them so as to form the characteristic S. True and typical secretions, such as bile, milk, &c., do not exist as such in the blood, but require to be *elaborated* in the glands devoted to their manufacture. In its actual details the work of S. is accomplished either by a membrane or by a gland. The structure of both of these is essentially the same. The conditions required to effect S. include physical, chemical, and vital phenomena. Thus fluids may undergo *filtration* and *diffusion* through membranes, whilst the chemical part of the work of S. consists in the separation from the blood of certain materials, and in the recombination of other matters to form a new compound. The cells of the secreting membranes or glands are the essentially active parts of these structures, and the intricate operations in which these cells engage may be regarded as a part of their vital constitution and as evidence of their inherited vitality. The circumstances influencing S., favourably or unfavourably, are in the main those which affect the quality and circulation of blood through glands. Thus a rapid circulation, causing a large quantity of blood to traverse the secreting surfaces, will favourably affect the quantity of the S., and *vice versa*. Then, lastly, the *nervous system* possesses a very striking but in many respects ill-understood influence on S. Indirectly, the nervous system acts on S. by influencing the quantity of blood sent to a gland, but the work of S. may also be affected directly by impressions passing from nerve-centres to a gland.

Secretions, Vegetable. The nutrient substances taken up by plants are, in a raw state, by no means adapted to take part in the construction of any vegetable structures; they must, on the contrary, undergo important transformations, and become changed into organic compounds suitable for nutrition. The process of *assimilation* (see SAP) seems to depend mainly on the following forces:—(1) The evaporation of water contained in the nutrient sap. (2) The decomposition of carbon dioxide and the fixation of carbon. (3) The formation of albuminoids, which are essential for the production of Protoplasm (q. v.), and Chlorophyll (q. v.). (4) The formation of the substances from which Cellulose (q. v.) is produced, viz., Starch (q. v.), the different kinds of Sugar (q. v.), Oil (q. v.), and Inuline (q. v.). The mode of formation of albuminoids is still unknown, so also is that of cellulose. The products of assimilation, when transferred to other cells and when brought into actual use, undergo a variety of changes which are included under the name *metatasis*. Many products of metatasis are of no further use in the construction of cells, but remain stored up and inactive at the spots where they are produced. These comprise the volatile oils, resin, caoutchouc, camphor, gum-like substances, tannin, pigments, acids, alkaloids, wax, pectin, &c.

Secret Writing-Ink. See SYMPATHETIC INK.

Secrole, the W. suburb of the city of Benares, in the N.W. Provinces, British India, which contains the civil establishments and military cantonments as well as the bungalows or villas of the European residents.

Section, in architecture, is the contour of a given structure on a vertical plane intersecting it through any part. The *plan* is a projection upon a horizontal plane.

Section, in geology, a cutting or face of rock, exhibiting the edges of the various strata. It may be *natural*, as in the face of a cliff; or *artificial*, as in the case of a mine or railway cutting. A *theoretical* section is a drawing intended to represent a vertical or horizontal succession of strata, not directly visible, but as calculated from observations in the neighbourhood.

Sector, in geometry, is the portion of a circle included between two radii and the intercepted arc. It is also the name of a mathematical instrument, employed for laying down plans, measuring angles, &c., and composed of two graduated legs, jointed together like a carpenter's foot-rule. There are various scales, which are ruled so as to converge to the centre of the

hinge, and which are intended for different purposes. Thus, in the more elaborate instruments, there are, beside the simply graduated scale of lines, scales of sines, of tangents, of chords, of rhombs, &c. The most ordinary use to which a S. is applied is for finding a fourth proportional to three given lines.

Sec'ular Cler'gy. See CLERGY.

Sec'ularism is the creed of those who deny the popular opinion of mankind that the universe was created at a particular time by a Personal Deity, with the doctrines founded thereon; holding the opinion, which is as old as Epicurus (A.C. 310), that the universe is eternal and self-existent. Secularists maintain that the belief in the existence of a personal being who created the universe was produced by the combination of two elements. First, the conception of a deity was formed out of various elements: the fear of death, which raised a hope that death is not the end of existence, but that a separate entity, the soul, has eternal life, so that there may well be a personal, spiritual deity; the sight of the sufferings of men in this world, and the frequent miscarriage of justice, which tend to make men believe in a deity of infinite wisdom, power, and goodness, who, in a future life, will rectify all the inequalities of this life; and the desire for the amelioration of the human race, the only hope of which was supposed to lie in the guidance of a benevolent deity. When men were thus prepared to accept any evidence of the existence of a deity, any one who said, and may have believed, that he had a supernatural revelation to that effect, would obtain a number of disciples. Many such revelations have undoubtedly been believed in by bodies of men, the converts to each believing that all revelations were false but their own. Further, Secularists reject the great argument for the existence of a God from final causes, as being contrary both to experience and the law of causality itself: to experience, because to account for the existing order of matter it presupposes a self-existent order in mind, whereas there is no experience of order in mind which does not arise from order in matter; to the law of causality, because the condition of the universe at any time is the necessary result of every preceding state; and since, according to the received results of modern science, matter and energy are each constant in amount, at the furthest term of the series to which we choose to go back the matter and the energy were the same as now; in other words, matter has been eternal, and therefore had no need of a cause.

Along with the belief in a Personal God, S. has rejected some of the most prominent doctrines of Christianity. 1. Finding the narratives of the Book of Genesis to be untenable, it rejects the doctrine of the Fall (q. v.), and the whole 'Scheme of Salvation'—including 'Redemption through the blood of Christ,' 'Justification by Faith,' &c.—depending on it. 2. According to Secularists, an investigation of the origin of the canon and the teaching of historical criticism lead to the conclusion that the Bible must be regarded as a human composition, and not a divinely-inspired and infallible authority. 3. The teaching of science and a comparison of religions leads to the rejection of the legends, myths, and miracles both of the Old Testament and the New. 5. To the conclusion that Jesus Christ must be regarded merely as a man of exalted moral character, around whom, when dead, the stories of the 'apocryphal and canonical gospels crystallised according to the tendencies of the time.' 6. On the question of a future life S. does not pronounce certainly or dogmatically, but leaves it 'in solemn hope.'

Such is the negative side of S., but it has a positive side as well. 1. Secularists believe in one Deity who manifests himself in energy, is unchangeable, and has no known beginning or ending; who governs according to fixed laws, and whose will, a revelation of which is always being made more and more complete, is written in his works; and obedience to whose will is the whole duty and the religion of man, which brings him happiness, while disobedience brings inevitable, merciless punishment, but always according to law. 2. It holds that man, instead of grovelling downwards from a primitive state of innocence and excellence to a state of degradation, from which only a small proportion of individuals are redeemed, is steadily advancing in civilisation and enlightenment, learning by experience, and throwing up safeguards of law and morality. 3. S. teaches men, instead of trusting to the atonement of another's sufferings, to live a true, pure, and noble life; and, instead of balancing the profit and loss of the enjoyment of the present life against the reward of a future life (and very far from saying, as ignorant detractors

would have it, 'let us eat and drink, for to-morrow we die'), to act rightly because it is noble to act so. 4. S. pleads for the prompt administration of justice now, knowing nothing of a judgment to come. 5. It substitutes benevolence and philanthropy for asceticism.

Secundra or **Sekunder**, a village in the district of Agra, N.W. Provinces, British India, 7 miles from Agra, named after the Pathan Emperor, Secundra Lodi. It is celebrated for the magnificent tomb of Akbar the Great, still in good preservation. The building is surrounded by a garden, and consists of a series of sandstone terraces, supporting a marble mausoleum. The architecture appears to be a combination of the Saracenic and Hindu styles. Close by is the tomb of Munni Begum, the Portuguese wife of Akbar. This building was for many years the headquarters of the Church Missionary Society, and afforded shelter to 300 orphans in the famine of 1838. See *Travels of a Hindu* (Lond. 1869); Fergusson's *History of Indian Architecture* (Lond. 1876).

Secundrabad ('Alexander town'), a British military cantonment in the dominions of the Nizam of Hyderabad, India, 6 miles N. of Hyderabad, and 449 S.E. of Bombay. It is built along an artificial lake, 3 miles long by 2 broad, called the Hussain Sagur. Three miles W. is a range of hills, covered with tombs of Mussulman saints. Pop. 40,000. S. is the headquarters of the 'Hyderabad Subsidiary Force,' which in 1874 numbered 6012 men of all arms, of whom 2547 were Europeans. In the same year, a branch line to S. from the Bombay-Madras railway at Gulbarga was opened.

Sedalia, a town of Missouri, U.S., in a high prairie country, within 3 miles of a tributary of the Missouri, and 40 miles S. of the main stream. It is the point of intersection of three railway lines, and is by rail 189 miles W. of St. Louis, and 100 E. of Kansas City. It has large railway works, flour-mills, iron-foundries, woollen-mills, &c., 2 daily newspapers, and a street-railway (since 1876). There are rich coal-mines in the vicinity. S. was only founded in 1860, and in 1870 had a pop. of 4560, and in 1877 of 10,000.

Sedan, an important town and fortress of France, department of Ardennes, on the Maas, 163½ miles E.N.E. of Paris by rail. Its fine cloth factories (founded by Colbert in 1646) employ 10,000 workmen, and it is also noted for the production of arms, leather, ironwares, &c. Near it are extensive iron and coal mines. It was the birthplace of Marshal Turenne. In the Franco-German War, the division of the French army under Marshal MacMahon, while advancing to the relief of Metz, was driven, after four days' incessant fighting, to seek refuge in S., and the day following (2d September 1870) saw the capitulation of a mar-hal of France with 90,000 men. Napoleon III. had already surrendered in person to the King of Prussia. Pop. (1876) 15,872.

Sedan Chair, an upright close box or chair for one person, carried by two men harnessed to poles or shafts. It was formerly very common in all European cities, but disappeared early in the present century. As a rival to the 'cab,' it survived longest in cities like Edinburgh, having streets ill-adapted for horse traffic. One form of S. was known in England in 1581. It only became fashionable in London, however, after the return of Prince Charles from Spain, and in 1634 Sir Sanders Dunscombe secured the royal privilege of exposing sedans for public hire. They were very conspicuous objects during the reigns of Anne and the early Georges, and the wealthy kept them for private use. The S. is said to take its name from the town of Sedan; in France, however, it is called *chaise à porteurs*. See PALANQUIN.

Sedatives are medicines which depress the action of the heart and of the vascular system. The principal *cardiac* S. are antimony and its preparations, veratrum viride, veratrum album, veratria, aconite leaves and root, prussic acid, cyanide of potassium, and vegetable acids. *Spinal* S. are bromide of ammonium and potassium, and physostigmata. *Stomachic* S. are carbolic acid, creosote, nitrate of silver, carbonate of bismuth, oxalate of cerium and zinc, and bicarbonate of potash. *Soothing* S. are medicines which depress the action of the nervous and vascular systems without inducing any previous or subsequent excitement, and are used chiefly in great excitability, neuralgic pain, spasmodic affections, and irritable cough, such as belladonna, hyoscyamus, and the preparations of opium.

Sedge. See CAREX.

Sedgwick, Adam, LL.D., F.R.S., one of the fathers of geology, was born at Dent, Yorkshire, in January 1786. He entered Trinity College, Cambridge, and graduated in 1808 as fifth wrangler. In 1810 he was elected Fellow in his college, of which at his death he was senior member. In 1818 he succeeded Hailstone as Woodwardian professor of geology at Cambridge, was elected a Fellow of the Royal Society the succeeding year, aided in founding the Cambridge Philosophical Society about the same time, and subsequently became a Fellow of the Geological Society of London, of which he was President in the years 1829-31. In 1827 he made a geological tour in Scotland; and two years later accompanied Murchison through Germany, Austria, and Switzerland. With Murchison he subsequently was involved in a bitter controversy regarding the use of the terms Cambrian and Silurian. To the end of his long life he occupied a leading position amongst geologists, devoting his great energies to the elucidation of Palæozoic formations, and by his lectures, which he delivered during fifty years, forming a band of enthusiastic disciples. He was an active member of the British Association, and a keen opponent of the Evolution theories advanced by Darwin, Spencer, Lyell, and others. A Liberal in politics, he took a hearty interest in all questions of University reform, and published a valuable essay, entitled *Discourse on the Studies of the University of Cambridge* (1834; 5th ed. 1850). S. died at Cambridge, January 25, 1873. His numerous reviews, lectures, memoirs, &c., are scattered through the various scientific publications of the day; some, however, including the essay above mentioned and a *Synopsis of the Classification of the Palæozoic Rocks* (1855), are published separately. See Geikie's *Memoirs of Sir R. J. Murchison* (1874) for a brief sketch of S.'s life and labours.

Sedgwick, Theodore, an American statesman and judge, was born at Hartford, Connecticut, in May, 1746. He entered the bar in 1766, and began legal practice at Great Barrington, Massachusetts, acting for several years as a member of the Massachusetts legislature. In 1776 he served as aide-de-camp to General Thomas in the expedition against Canada; and after the declaration of independence took a leading part in politics, sitting as member of Congress from 1789 to 1796, and again from 1799 to 1801, when he discharged the duties of Speaker. In 1802 he became judge of the Supreme Court of Massachusetts, a post which he retained till his death at Boston, January 24, 1813. An accomplished statesman and jurist, and a keen federalist, he was a strong opponent of slavery.—**Theodore S.**, eldest son of the preceding, was born at Sheffield, Massachusetts, December 31, 1781. He followed his father's profession, and as member of the Massachusetts legislature in 1827 introduced and carried a bill for the construction of a railroad from Boston to Albany through the Green Mountains. He was a most effective speaker, and was an earnest advocate of free trade, temperance, and anti-slavery. He died at Pittsfield, Massachusetts, November 7, 1839. He is author of *Hints to my Countrymen* (1826), and *Public and Private Economy, illustrated by Observations made in Europe in 1836-37* (3 vols. 1836-39, 2d ed. 1856).—His wife, **Susan Ridley S.**, a daughter of William Livingstone, governor of New Jersey, was born about 1789 and married in 1808. She is the author of *The Morals of Pleasure* (1829), *The Young Emigrants* (1830), *Allen Prescott* (2 vols. 1835), *Alida* (1844), and *Walter Thornley* (1859).—Their son, **Theodore S.**, born at Albany, January 27, 1811, followed the profession of his father and grandfather, entering the bar in 1833. Appointed secretary of the United States legation at Paris, on his return to New York he began legal practice. In 1858 he became district attorney for the southern district of New York. He died at the family seat at Stockbridge, December 8, 1859. His chief publications are a *Treatise on the Measure of Damages* (1847; 5th ed. 1869), a *Treatise on the Rules which govern the Interpretation and Application of Common and Statutory Law* (1857), a *Memoir of Governor William Livingstone* (1833), and *The Life and Works of William Leggett* (2 vols. 1840).—**Catherine Maria S.**, daughter of Judge Theodore, was born at Stockbridge, December 28, 1789. After her father's death in 1813, she undertook the management of a private school for young ladies, which she continued for fifty years. She died near Roxbury, Massachusetts, July 31, 1867. She wrote a number of popular works of fiction,

373

among others *A New England Tale* (1822), *Redwood* (2 vols. 1824), *The Traveller* (1825), *Hope Leslie* (2 vols. 1827), *The Linwoods* (1835), *Live and Let Live* (1837), *Means and Ends* (1838), *Letters from Abroad to Kinred at Home*, a record of her visit to Europe in 1839 (1841), *Wilton Harvey and other Tales* (1845), *Facts and Fancies* (1848), *Married or Single?* (1857), and *Letters to my Pupils* (1862). She contributed the *Story of Le Bossu* to Sands' *Tales of Glauver Spa* (1832), and wrote much for various magazines and periodicals. See Mary E. Dewey's *Memoir* (1871).

Sedition is the crime of inciting any one to break the law, or to disturb the peace of society. The punishment is fine and imprisonment, in proportion to circumstance. Any public meeting under circumstances to cause fear of disturbance may be held seditious. A meeting called 'to adopt preparatory measures for holding a national convention' was held, in the case of *Rex v. Furzey*, to be illegal. See MEETINGS, SEDITIOUS; RIOTS.

Sedley, Sir Charles, born at Aylesford, Kent, in 1639, educated at Oxford, became a court wit after the Restoration. He was a great favourite with Charles II., his recommendations being that he had no morals, did not ask favours, and had a knack for turning loose thoughts into dulcet verse. As he grew older, serious business obtained attention from him, and in Parliament he uniformly opposed the unconstitutional policy of James II. That monarch dishonoured S.'s daughter by making her a countess; and S. was in consequence of this disgrace one of the chief promoters of the Revolution. He died August 20, 1701. His amatory poems—translations from the classics, parliamentary speeches, and plays—the best are *The Mulberry Garden* (1668), *Antony and Cleopatra* (1677)—may be found in his collected works (2 vols. 1722).

Seduction, in law, is the inducing of a woman to sexual intercourse by deceit. It is only criminal when the deceit is practised by a third party, in which case S. is by statute a misdemeanour, punishable by imprisonment for a term not exceeding two years. When force is used the crime is *Rape* (q. v.) or *Abduction* (see ABDUCTION OF WOMEN). Unless a woman has promise of marriage, she can obtain no damages from her seducer on account of S.; but, by a fiction of law—the supposed consequent *loss of service*—any one under whose protection the injured woman has been during pregnancy, may maintain an action against the seducer; against whom, in Scotland, the woman may have ground of action at her own instance; but a good deal of difficulty is usually found in enforcing the claim.

Sedum (L. *sedes*, from the squatting habit of the species) is a genus of erect or prostrate succulent herbs, with opposite, alternate, or whorled leaves; flowers mostly cymose; 4-5 lobed calyx; 4-5 free petals; 8-10 stamens, alternately opposite the petals; 4-5 carpels; and many ovules. This genus of *Crassulaceæ* (q. v.) number about 120 species, natives of N. temperate and cold regions, but rare in America. The best-known species is *S. acris*, a dwarf golden-yellow flowered plant growing in tufts or cushions on rocks, walls, and sandy ground, especially near the sea. It is called 'biting stone-crop' and 'wall-pepper' on account of its acrid taste, and is vesicant, emetic, and cathartic. *S. Telephium* ('the Orpine') and *S. Rhodiola* ('Rose-root') are the most striking British species. A number have come into vogue for the new fashion of carpet-gardening, and for rock gardens. S. is remarkable for vitality under the most adverse circumstances—hence its name of 'live-long.'

See (Lat. *sedes*, scil. *apostolica*, 'Apostolic seat') originally meant, as well as *cathedra*, the throne of a bishop, believed by Episcopalians to sit in the seat of an Apostle. Then both names were applied to the church in which the throne was placed. In modern times S. generally means the cathedral town of a Diocese (q. v.), or the district over which the bishop has jurisdiction, and popularly is synonymous with diocese itself.

Seed (Old Eng. *sæd*, from *sæwan*, 'to sow'; comp. Lat. *satus*, from *sero*). The S. of a plant is its mature *Ornule* (q. v.). As the ovules are in the great majority of flowering plants contained in one or more cavities of that portion of the Pistil (q. v.) termed the Ovary (q. v.), so likewise are the seeds similarly enclosed—the transformed ovary of the flower being called in the fruit the *pericarp*. All plants that come under this arrangement are termed *Angiospermia*, i.e., having S. in

561

a S.-vessel. In *Conifera*, *Cycadea*, and *Gnetacea*, on the other hand, the S. is without any real pericarp—and such constitute the *Gymnospermia*, or naked-seeded plants. The shell of the individual S. usually consists of two separable *coats*; the outer being named the *testa*, and the inner the *tegmen* or *endopleura*. The testa may be hard and crustaceous, woody or bony, or thin and membranous, dry or rarely succulent. It is sometimes expanded into *wings*, or bears a tuft of hair, cotton, or wool, called a *coma*. The *funicle* is the stalk by which the S. is attached to the Placenta (q. v.). It is occasionally enlarged into a membranous, pulpy, or fleshy appendage, sometimes spreading over a considerable part of the S., or nearly enclosing it, called an *aril* (as in the mace of a nutmeg). The *astrophiole* or *caruncle* is a similar appendage proceeding from the testa by the side of or near the funicle (as in castor-oil plant). The *hilum* is the scar left on the S. where it separates from the funicle. The *micropyle* is a mark indicating the position of the foramen of the ovule. The ripe S. contains an *embryo* or young plant, either filling or nearly filling the cavity, or more or less immersed in a mealy, oily, fleshy, or horn-like substance, called *albumen* or *perisperm* or *endosperm*. The embryo lies unattached within the S., its position varying in different plants. It consists of the *radicle* or base of the future root; one or two *cotyledons*, or future S. leaves, and the *plumule* or future stem-bud. In some seeds, especially when there is no albumen, these several parts are very conspicuous, in others they are difficult to distinguish until the S. begins to *germinate*. Chiefly upon the fact whether the embryo has one or two cotyledons are founded the two great classes of *Monocotyledons* (q. v.) and *Dicotyledons* (q. v.). The relative position of the different parts of the embryo gives a marked character to the S. The most common arrangement is that found in *Crucifera*, where the embryo is *pleuro-rhizal*, the cotyledons lying flat one upon another, and the radicle upon the line which separates them. In the *notorhizal* embryo, the radicle lies upon the back of one of the cotyledons, which again lie flat upon one another. The embryo is *orthoplosic* when the radicle lies in the hollow channel of the folded cotyledons. In these three arrangements the cotyledons are spoken of respectively as *accumbent*, *incumbent*, and *conduplicate*. In the *spiral* embryo the cotyledons are laid flat upon one another and coiled spirally.

The germination of many seeds takes place as soon as they escape from the fruit, and obtain favourable conditions of moisture and warmth; in others, on the contrary, a period of rest seems to be necessary in order for them to attain perfect ripeness. During the process of germination certain changes take place in the contents of the seed, by which they are rendered fit for the nourishment of the embryo. One of the most remarkable of these is the conversion of starch into dextrose or grape-sugar, *i.e.*, an insoluble into a soluble substance. It is attended by the absorption of water, the formation of carbon dioxide, and heat is produced, as evidenced in malting. The *seedling* derives its earliest nutriment from the S., and especially from the cotyledons, or when there is albumen, from it also through the medium of the cotyledons. The radicle first emerges from the S. and after it the plumule. The range of temperature essential for the germination of the S. is diverse in different species; in some cases it may be carried on even at freezing point. Seeds when buried deep in the soil evidently sometimes lie dormant for a long period, and only vegetate when air is admitted by the process of subsoil ploughing or other operations (see MUMMY WHEAT). Darkness is favourable for germination. In some seeds the vital power is destroyed by keeping (under ordinary conditions) during the space of a few weeks or even a few days after they are fully ripe, whilst others will retain their vitality for many years, especially such as contain starch. Fresh seeds, however, in general germinate more quickly and easily than old ones. Out of 368 species sown at Geneva by A. de Candolle, 17 only grew after the S. was fifteen years old, and out of representatives of 288 genera whose seeds were similarly experimented upon under the auspices of the British Association, it was found that the majority had lost their vitality altogether after being kept ten years. Wheat grain left by the *Folaris* in N. lat. 81° 16', and after an exposure of five years to a temperature of 72° to 104° of frost brought back by the *Discovery*, germinated in 1877 and 1878 to the extent of 20 per cent.

S.-producing power is very variable. Each average plant of such common British weeds as the chenopodium, the red poppy,

the shepherd's purse, and the chickweed, may be fairly estimated to yield 20,000, 6000, 15,000, and 3000 seeds respectively, whilst the S. of the water-pest (*Anacharis*) and the sweet flag (*Acorus*) is unknown in Britain—their increase being secured by other means. Winds, water, animals, and man—in his commercial, manufacturing, agricultural, and emigrant phases—are active agents in the dissemination of seeds, whereby new formed land in time obtains its vegetable clothing, and the plants of one country are transported to and thrive in distant territories.

To transmit seeds from foreign countries, they should be made up in dry papers and exposed to free ventilation in a cool place; or they may be mixed with moderately dry ordinary soil and put into tight-corked earthenware (blackening) bottles.

Seeland. See SJAELLAND.

Seeley, John Robert, an historical and theological writer, and the son of a well-known publisher, was born in London in 1834. He was educated at the City of London School, and graduated B.A. at Christ's College, Cambridge, in 1857, when he was bracketed Senior Classic, and obtained the Senior Chancellor's medal. In the following year he was elected a fellow of his college, where he lectured for some two and a half years, and after holding the appointment of classical assistant to his old school, was chosen professor of Latin in University College, London, in 1863. On the recommendation of Mr. Gladstone he was appointed in 1869 to succeed Charles Kingsley in the chair of modern history at Cambridge. His principal work, *Ecc Homo, or the Life and Work of Jesus Christ*, was published anonymously in 1866, and had reached a 13th edition in 1876. So far as it is argumentative, it attempts to eliminate the divine element, and to emphasise and elevate the humanity of Christ; but though vulnerable as a dogmatic thesis, it has obtained a permanent place in literature as a masterly piece of portraiture, radiant in colour and touched with the tenderness of love. *Ecc Homo* startled the orthodox world by the earnest tone of its dissonance, and called forth numerous replies, chief of which was that of Mr. Gladstone. Among S.'s acknowledged works are *Classical Studies as an Introduction to the Moral Sciences* (1864), *An English Primer* (together with the Rev. E. A. Abbot, 1869), *Lectures and Essays* (1870), and an edition of *J. J.* with an introduction, historical examination, and notes (Clarendon Press Series), of which the first vol. appeared in 1871.

Seer (*Ser*, derived from the Sansk. *setaka*), the standard measure of weight in India. It varies in different parts of the country. The standard S., which contains 80 tolas, each the weight of a sicca rupee, is equal to 2 lbs., 6 oz., 14 drs. avoidupois; and 40 *seers* make up the *maund*, which is thus equal to about 82 lbs., or nearly 28 lbs. to the ton. In Bombay, the bazar or local S. weighs as little as 13 oz.; while the Government of India have attempted, but in vain, to introduce an imperial S. of 2.205 lbs., exactly equivalent to the metrical kilogramme. The S. is universally used to estimate the price of grain; and variations in the market rates are expressed, not by quoting the amount of money required to purchase a given quantity, but the varying number of seers that can be obtained for the rupee. Thus, taking the rupee = 2s., and the S. at 2 lbs., 36 seers of rice for a rupee means that rice is selling at 1d. for 3 lbs. The S. also forms the standard liquid measure, being in this case equal to about 1 pint 2 gills.

See'ta or **Sita** (*Sata*, 'furrow'), a popular goddess of Hindu mythology, and the wife of the hero Rama, an incarnation of Vishnu. She got her name from having first appeared in front of her supposed father's ploughshare.

Segg'ar, or **Sagg'er**, a vessel of fire-clay, usually cylindrical in form, for enclosing and protecting earthenware while being baked in the kiln. A pile of seggars in the kiln constitutes a *bing*.

Segment, in geometry, is the part of a circle cut off by a straight line, or of a sphere cut off by a plane.

Seg'no (Ital. *sign*), a sign ♩ placed in musical compositions over a note, pointing out the place from which a portion of the piece is to be repeated.

Se'go, capital of the state of Bambarra (q. v.), Western Africa, lies on both sides of the Joliba, or Upper Niger, which is here as broad as the Thames at Westminster. The

town is surrounded by mud walls, and the houses, including the king's palace, are of clay. The streets are narrow but clean. The inhabitants are Negroes and Moors, the latter being the ruling class. S. has considerable trade, both by land and water. Pop. 30,000.

Segovia (Lat. *Segovia*; Gr. *Segubia*), a town of Spain, capital of the province of S., Old Castile, 42 miles N.W. of Madrid, on a steep acclivity on the left bank of the river Eresma, 3280 feet above the sea-level. It was an important town in the days of the Romans. The great aqueduct, the finest Roman relic in Spain, which passes over part of it, was probably erected by Trajan. It is built of granite blocks, in two tiers of 15 arches, 2720 feet long, and 105 feet high in the middle. There is also a Roman amphitheatre. Under the Moorish rule S. had great cloth manufactures. In the Middle Ages it was frequently the residence of the kings of Castile and Leon, and Charles I. of England lodged in the alcazar on the 13th September 1632. This alcazar, originally Moorish, was rebuilt in the middle of the 16th c., but was destroyed by fire in 1862. The cathedral of S., begun in 1522, is a splendid florid Gothic erection, with a tower 330 feet in height. S. has besides, 24 churches and 21 monasteries. It has still some cloth manufactures, and the products of its wool-scouring industry are famous. Pop. 10,400.

Ségur, a French family of great antiquity and distinction. It suffered much during the Huguenot Wars. Among its most notable members are—(1) **Philippe Henri, Marquis de S.**, born January 20, 1724, served with the French army in Germany, distinguishing himself at the battles of Rocoux (1746), and Laffeld (1747). In 1780 he was appointed minister of war by Louis XVI., who three years later made him a marshal. He lost much of his property during the Reign of Terror, and died October 8, 1801.—(2) **Louis Philippe, Comte de S.**, son of the preceding, born at Paris, December 10, 1753, in 1782 joined Rochambeau's army in America, and in 1784 was appointed French ambassador to the court of Catharine II., with whom he became a favourite. Some plays he wrote for her have been published under the title of *Théâtre de l'Hermitage* (1798). His other writings are:—*Histoire des Principaux Evénements du Règne de Frédéric Guillaume II.* (1800, 5 vols.), *Décade Historique, ou Tableau Historique de l'Europe de 1786 à 1796* (1801, 3 vols.), *Mémoires, Souvenirs, et Anecdotes* (1824, 3 vols.), and several histories, of which the most noted is the *Histoire de France* (1824–30, 9 vols.). His collected works occupy 33 vols. (Par. 1824–30). He followed Napoleon during the Hundred Days, and unsuccessfully endeavoured to become the companion of his master in exile. He died August 27, 1830. See his *Vie et sa Temps* by Taillandier (Par. 1875).—(3) **Philippe Paul, Comte de S.**, son of the preceding, born at Paris, November 4, 1780, was a general of the first Empire, and was dismissed after the second restoration. In 1830 the Academy appointed him to one of its vacancies on account of his *Histoire de Napoléon et de la Grand Armée pendant l'Année 1812* (2 vols. 1824), and *Histoire de Russie, Histoire de Charles III.* (2 vols. 1834; 2d ed. 1842), and *Histoire et Mémoires* (7 vols. 1873). In 1831 he became a peer, but after the Revolution of 1848 he retired from public life. He died at Paris, February 25, 1873. His *Mélanges* appeared in 1874.

Segura, a river of the S.E. of Spain, rises in the Sierra Seca, and flows eastward through the fertile and populous valley of Murcia to the Mediterranean, passing the towns of Murcia and Orihuela. Its length is 180 miles. It is not navigable.

Seidlitz Powders are composed of 2 drms. of Rochelle salts and 40 grains of the bicarbonate of soda reduced to powder, and mixed, and enclosed in a blue paper. 37 grains of tartaric acid are enclosed in a white paper. When they are taken, the powders are dissolved separately, the solutions added, and the whole drunk whilst effervescing. S. P. are refrigerant and laxative rather than purgative, and they should be taken on an empty stomach, as before breakfast. One powder is the usual dose, but two are often necessary.

Seine (Lat. *Seguana*), a river of northern France, rises in the department of Côte-d'Or, at the foot of Mount Tasselot, at an elevation of 1460 feet above the sea-level. It flows generally in a N.W. direction, through the departments of Aube, S. et Marne, S.-et-Oise, Eure, and S.-Inférieure, until it reaches the English Channel at Havre, 253 miles in a direct line from its source,

but 473 miles if we include its windings. Its basin has an area of 26,350 square miles. The principal towns on its course are Chatillon, Troyes (below which, 345 miles from the sea, it becomes navigable), Corbeil, Paris, St. Denis, St. Germain, Poissy, Mantes, Elbeuf, Rouen, Quillebeuf, Honfleur, and Harfleur. Between the two latter its estuary is nearly 6 miles wide. Its principal tributaries are, on the right the Aube, Marne, and Oise, and on the left the Yonne and Eure. It is connected by canals with the Loire, Saône, Scheldt, and Rhine, and a lateral canal between Havre and Tancarville, 16 miles long is projected (1878). On account of the high tariff and the difficulties of navigation only 150,000 tons of goods are brought to Paris annually by the S., while 900,000 tons are transported by the Havre and Paris railway. The S. is subject to a remarkable bore, and its course is impeded by shifting shoals, while fogs are frequent during part of the year. As many as 20 English steamers went aground in the river in 1877.

Seine, a department of north-eastern France, part of the former province of Ile-de-France, the smallest but most populous in the republic. It is entirely surrounded by S.-et-Oise, its area being only 183 square miles, of which Paris (q. v.) occupies 35 sq. miles. Its pop. (1876) was 2,410,849, that of Paris alone being 1,938,806. The river S. flows through the department in a north-westerly direction for a distance of 37 miles. The surface of S. is undulating, and at Vincennes, Meudon, St. Cloud, as well as in the Bois de Boulogne, and generally to the southward of Paris, is richly and beautifully wooded. Mont Valérien rises 446 feet above the sea-level, and the heights of Montmartre and Chaumont within Paris are also considerable. The naturally calcareous and barren soil has been elaborately fertilised, and now yields great quantities of vegetables and fruits, and there are rich quarries of gypsum and building-stone. Besides Paris, the principal towns are St. Denis, Vincennes, Charenton, and Sceaux.

Seine-et-Marne, a department of north-eastern France, bounded on the W. by Seine-et-Oise, on the N. by Oise and Aisne, on the E. by Marne and Aube, and on the S. by Yonne and Loiret. The Marne flows through the N., and the Seine through the S. Area 2208 sq. miles, pop. (1876) 347,323. Its surface is undulating, and its soil fertile, being particularly suited to cereal crops (wheat 6,135,000 bushels in 1876), vegetables, and fruits. It produces a great quantity of indifferent wine, but the *Chasselas de Fontainebleau* is famous as a table grape. Woods cover a great proportion of the surface, among them being the famous forest of Fontainebleau. The principal towns are Melun, Meaux, Coulommiers, Provins, and Fontainebleau.

Seine-et-Oise, a department in the N. of France, completely surrounding the department named Seine, which contains Paris. Area, 2164 sq. miles; pop. (31st December 1876) 561,990. The country consists of plain, with low hill-ranges, and towards the N. is partially covered with forests. Though not naturally very fertile it is intersected by numerous tributaries of the Seine, and is in a high state of cultivation. Much grain and wine are produced (wheat, 5,831,000 bushels in 1876). Chalk and building-stone are found among the hills. Paper is manufactured at Esonnes, and porcelain at Sèvres. St. Cloud, where Napoleon's palace was built, is of great historical interest. But the chief town is Versailles (q. v.).

Seine-Inférieure, a department of France, in Normandy, bounded on the N. by the English Channel, and on the S. by the Seine. Area, 2329 sq. miles; pop. (1876) 798,414. The country is a fertile plain, the only hills being those of Caux, whose highest point is scarcely 900 feet high. The country is almost all arable or wooded, and contains many cattle. There are many fruit-trees, and hence great manufactures of cider, of which, in 1877, 29,047,568 gallons were produced. The product of wheat in 1877 amounted to 5,867,000 bushels. About half the population is engaged in manufactures, whereof the chief are weaving, spinning, and various kinds of metal-working and machine-making. The department is one of the most thickly peopled in France. The capital, Rouen, is connected with Havre, Dieppe, and Paris by rail.

Seir-fish (*Cybius guttatum*), a Teleostean fish, belonging to the Mackerel family (*Scomberidae*), and occurring in E. Indian seas. It resembles the salmon. The tail is keeled laterally, and the flesh is nutritious and palatable.

Seistan, a considerable tract of country, lying on the frontier between Afghanistan and Persia, which has long formed a subject of contention between the two countries. It consists chiefly of the basin of the river Helmund (q. v.), and is a desert plateau more than 2000 feet above the sea. The soil, mostly stiff clay, with quicksands here and there, is covered with coarse grass and tamarisk bushes. There are evident traces of former cultivation and prosperity, and S. is the classic land of early Persian romance, having been the cradle of Rustum. It was devastated by Timur in 1383. The frontier line was demarcated by a diplomatic expedition from India in 1872, led by General Goldsmid. For the most part, he made the Helmund to be the boundary line between the rival powers; but both banks of that river in its upper channel were assigned to Afghanistan.—**Lake S. or Hamoon** is a large and very shallow lake, 85 miles in length and from 20 to 40 in breadth. It is girdled by groves of tamarisks and other trees, receives the waters of the Helmund and other streams, has no outlet, and overflows its boundaries and fertilises a wide area of land. Its waters are unpleasant to the taste.

Seja'nus, Ælius, the son of a Roman knight, was born in Etruria, and in 14 A.D. was made an officer in the Prætorian band. After visiting Pannonia S. returned to Rome, and proceeded to intrigue for supreme power. He persuaded Tiberius to allow the legions to be gathered together under his command on the Viminal (23), and thus he overawed the civil powers. He sought in every way popularity with the army; he poisoned Drusus, the heir-apparent, with the view of marrying his wife Livia; and gradually induced the Emperor to give him a larger and larger share in the conduct of affairs. Tiberius at length retired to Capræ, but here S.'s influence over him grew weaker, and he met the favourite with a duplicity equal to his own. One day (31) Macro arrived with a letter authorising him to supersede S. in the command of the guard. S. was arrested; the Senate at once condemned him to death; not a friend interposed a word for him; he was immediately executed, and his corpse was thrown into the Tiber.

Sel'borne, Roundell Palmer, Baron, born at Mixbury, Oxfordshire, November 27, 1812, was educated at Rugby and Winchester, and gained an open scholarship at Trinity College, Oxford (1830). He took a first class in classics (1834), carried off five university prizes and scholarships, and obtained a Magdalen fellowship. Called to the bar (1837), he achieved a great reputation as a Chancery barrister, was made Q.C. (1849), and sat as a Liberal Conservative for Plymouth from 1847 to 1857, and for Richmond from 1861 to 1872, being appointed Solicitor-General and knighted (1861). He was Attorney-General (1864-66), acted as counsel to the British Government at the Alabama Congress (1872), and in the same year became Lord Chancellor under the title Baron S. of Selborne, Hampshire, retiring from office in February 1874. In 1877 he was elected Lord Rector of the University of St. Andrews. He edited the *Book of Praise, from the best English Hymn-writers* (1862), published *Notes on some Passages in the Liturgical History of the Church of England* (1878) and various pamphlets, and contributed a 'Chapter of Antiquities' to F. B. Buckland's edition of White's *Selborne* (1876).

Sel'by, a market-town in the West Riding of Yorkshire, on the Ouse, 20 miles E. of Leeds by rail. The stately abbey church (partly restored by the late Sir G. G. Scott, 1873) exhibits a variety of styles from Norman to Perpendicular, and has lost its S. transept from the fall in 1690 of the central tower (meanly rebuilt 1702). The abbey holds the unique position of being the one great Benedictine monastery in the North of England which has survived as a parochial church. Other edifices are the First Pointed church of St. James (1868), with a spire of 165 feet, a Second Pointed Catholic church (1859), the town-hall (1825), assembly-rooms (1841), and a modern Gothic market-cross. Goole has absorbed most of the river trade, but stone is still exported, and the industries include malting, flax-scutching, the manufacture of ropes and shoe-thread, iron and brass founding, brewing, tanning, &c. S. publishes two weekly newspapers. Pop. (1871) 6193. At S., the traditional birthplace of Henry I. (1068), the Conqueror founded in 1069 a Benedictine abbey, of which, besides the church, only the barn remains; and in the Great Rebellion, the town, after being captured by the

Royalists, was recovered by Fairfax (1644). See Morrell's *History of S.* (Lond. 1867).

Sel'den, John, born at Salvington, Sussex, September 16, 1584, after three years' study at Hart Hall, Oxford, proceeded to Clifford's Inn, London, and thence to the Inner Temple. Finding himself, however, ill-fitted for distinction at the bar, he turned his attention to constitutional history, in 1606 compiling his *Analecton Anglo-Britannicon*, and following it up with *Jani Anglorum Facies Altera* (1610), and the masterly *Titles of Honour* (1614). His *Treatise of Tythes* (1618) brought him into collision with the clergy, as impugning their divine right to tythes, and in 1621 he suffered a brief imprisonment for defending the privileges of Parliament against the crown. Elected member for Lancaster (1623), S. was again lodged in the Tower (1630) for opposition to the royal policy, remaining there four years, and as member for the University of Oxford (1640) he espoused the popular cause, helping to draw up the articles of Laud's impeachment, sitting as lay member in the Westminster Assembly (1643), receiving a commissionership of the Admiralty (1644), and being appointed a university visitor (1647). At the same time he disapproved of Charles' execution, and refused Cromwell's request that he would answer the *Eikon Basilike*. He died in the house of Elizabeth, Dowager-Countess of Kent, November 30, 1654, having constantly set forth his self-adopted motto, *Peri pantos tēn Eleutherian* ('Freedom above all'). Such as Erasmus to the Reformation was S. to the English Revolution, a keen-eyed, moderate politician, who could detect and strive to redress the faults of a system without necessarily involving in condemnation the entire system itself. Amongst S.'s other works were *De Diis Syriis Syntagmata Duo* (1617), *Marmora Arundelliana* (1629), *De Jure Naturarum et Gentium juxta Disciplinam Hebræorum* (1640), and *De Anno Civili et Calendario Judaico* (1646). More famous than these is the posthumous *Table-Talk* published by S.'s secretary Milward in 1689 (ed. by S. W. Singer, Lond. 1847; 3d ed. 1860), of which Coleridge somewhat hyperbolically remarked that it contained 'more weighty bullion sense than any uninspired writing.' A complete edition of his works was edited by D. Wilkins (3 vols. Lond. 1726), and his *Life* was written by J. Aikin (1812) and G. Johnson (1835).

Sel d'Or (Fr. 'salt of gold'), a double hyposulphite of gold and sodium, used in 'toning' photographic prints and intensifying the Daguerreotype image. See GOLD and PHOTOGRAPHY.

Sel'ene (Lat. *Luna*), usually said to be the daughter of Hyperion and Theia, was the goddess of the moon, and sister of Helios, god of the sun. Her other name 'Mēnē,' containing the same root as the Lat. 'mensis,' and the Eng. 'moon,' means the 'measurer,' i.e. of time. S. is represented as a beautiful woman, clad in a flowing robe with a coronet on her head and large wings. She loved Endymion, and lulled him to sleep that she might kiss him. See DIANA.

Sel'enite (Gr. *selēnē*, 'the moon'), includes all the transparent foliated varieties of gypsum, originally so named from their frequent moon-like lustre. See GYPSUM.

Sel'enium (Se = 79.5), a rare element closely allied to sulphur, occurring in nature chiefly as selenides of metals associated with the corresponding sulphides. The iron pyrites of Fahlun in Sweden is remarkable for the presence of S., and is the source from which the element was first obtained by Berzelius in 1817. Like sulphur, it is capable of existing in three allotropic conditions: the red amorphous variety obtained by sublimation or precipitation from solution; the black vitreous variety; and the crystalline form deposited from solution in bisulphide of carbon. It forms two acids, *selenious* (SeO₂) and *selenic* (SeO₃) acids, the latter of which is not known in the anhydrous state. The seleniates closely resemble the corresponding sulphates; but when heated with hydrochloric acid they decompose, evolving chlorine and producing selenious acid. Selenious acid results from the combustion of S. in oxygen. Two chlorides are known, the dichloride (Se₂Cl₂), corresponding to the dichloride of sulphur, and the tetrachloride (SeCl₄), which has no analogue in the sulphur compounds. Two sulphides are also known, the bisulphide (SeS₂) and tersulphide (SeS₃), the former of which appears as a yellow precipitate when sulphuretted hydrogen is passed into solution of selenious acid.

Selen'cia, the name of several cities founded by Seleucus Nicator. The chief were (1) **S.** on the Tigris. It was situated about 40 miles N.E. of Babylon, soon overshadowed the more ancient city, rose to great commercial eminence, and at one time even counted 600,000 inhabitants. It was for long the eastern capital of the Seleucidae. Taken by the Parthians 140 B.C., and sacked by Trajan 116 A.D., in a few years its glory utterly vanished, and by the 4th c. its site had become a howling wilderness.—(2) **S. Pieria**, 4 miles N. of the mouth of the Orontes, in Syria, was the seaport of Antioch, which it rivalled in splendour. It declined under the Roman dominion and is now a heap of ruins.—(3) **S. Tracheotis**, in Cilicia, was the birthplace of Athenæus and Xenarchus the peripatetic. Friedrich I. Barbarossa died here.

Seleuc'idæ, the name of the dynasty of kings to which fell that division of Alexander the Great's empire which included Syria, a large part of Asia Minor, and the eastern provinces.—**Seleucus I.**, surnamed **Nicator** ('the conqueror'), born about 358 B.C., was the son of Antiochus, a general of Philip of Macedon, and accompanied Alexander on his Asiatic expedition. After Alexander's death he at first espoused the cause of Perdiccas, but afterwards conspired against that general, and headed his assassins at Pelusium. In the second partition of the empire he obtained Babylonia, and received from Antigonus the satrapy of Susiana; but subsequently quarrelling with Antigonus, he fled to Egypt, there leaguening against him with Ptolemy, Lysimachus, and Cassander. In 312 he regained power in Babylonia; and from this date the era of the S. commences. In 306 he assumed the title of king; in 302 he again joined his former allies in resisting Antigonus; in 301, after the victory of Issos, he obtained the greater part of his dominions in Asia Minor. In 288 he went to war with his father-in-law, Demetrius Poliorcetes, and in two years subdued him. He next invaded Thrace, routing and killing its king, Lysimachus, at Corupedium in 281. The result of these campaigns was the acquisition of the remaining portion of Asia Minor. Seleucus was assassinated by Ptolemy Ceraunus, 280 B.C. He was an able administrator, and the justest of Alexander's successors. Of the many large Greek colonies he planted in his empire, there may be mentioned Antioch in Syria, Bercea, Edessa, Pella, and Seleucia on the Tigris.—After the reigns of Antiochus I. and Antiochus II., **Seleucus II.**, surnamed **Callinicus**, son of Antiochus II., became king in 246. Ptolemy Euergetes soon deposed him, but after a prolonged contest concluded a peace of ten years with Seleucus, and retired. The reign of Seleucus was so much disturbed by war, in which he always himself took an active part, that he was called Callinicus, or 'distinguished conqueror.' After a reign of twenty years, often imperilled by his brother Antiochus, he died of a fall from his horse in 226.—**Seleucus III.**, surnamed **Ceraunus**, son of the preceding, ascended the throne in 226. He was on his way to attack the King of Pergamos, in Asia Minor, when one of his generals poisoned him (223). He was succeeded by his brother, Antiochus III.—**Seleucus IV.**, **Philopator**, succeeded his father, Antiochus III., in 186. The principal event of his reign was an attack on the king of Pergamos, held in check by the Romans. He was poisoned by his minister Heliodorus (175), and left the throne to Antiochus IV., his brother. For more than 200 years (from the time of Seleucus I.) this dynasty was one of the most prosperous in the world. Until 114 it maintained Antioch as the undisputed capital of Syria; but at this time Ptolemy Physcon, by his intrigues, succeeded in undermining the kingdom, and Antiochus Cyzicenus was established in a new sovereignty at Damascus. In chronology the Era of the S. was adopted by all the Greek colonies bordering on the Levant, was followed by the Jews till the 15th c., and is still in use among certain Arabians. The Jews term it the Era of Contracts, and in Maccabees it is called the Era of Kings.

Selim I., Sultan of the Ottoman Empire, was born in 1467, and on the 25th April 1512, with the help of the Janissaries, de-throned his father, Bajazet II. (q. v.), who four weeks later died of poison. Having secured his throne by the murder of two brothers, five nephews, and a host of lesser rivals, S. warred with Shah Ismail of Persia (1514), and defeated him on the plain of Tchaldoran; but the victory was dearly bought, and the Janissaries' murmurs forced him to retrace his steps, and rest satisfied with the conquest of Diarbekr and Kurdistan (1515). However, in 1516 he turned his arms against the Mameluke

Sultan of Egypt, Kansû-ghori, and by the victory of Majabik became master of Syria. Breaking off negotiations with Tuman-Bey, Kansû's successor, he suddenly advanced on Cairo, captured it after winning a battle in the neighbourhood, and reduced all Egypt to an Ottoman pashalic. This conquest, coupled with the abdication of the last of the Abbasside Khalifs, led S. to assume the title of Imâm, or representative of Mohammed, and Mecca thenceforth acknowledged him and his successors as heads of Islam. Returning to Turkey, he busied himself with the arts, the construction of a navy, the chastisement of the Janissaries, and the amelioration of the nations he had subdued, and had just prepared an expedition against Persia and Rhodes, when he died 22d September 1520. See Sir Edward Creasy's *History of the Ottoman Turks* (new ed. 1877).—**S. III.**, Sultan of Turkey, was born 24th December 1761. On the death of his father Mustapha III. in 1774, his uncle Abd-ul-Hamid succeeded, S. meanwhile occupying himself with the study of European methods of government and organisation. He succeeded Abd-ul-Hamid in 1789, but the time was not favourable for attempting the reforms which he contemplated. Until 1800, wars with Russia and Austria, and insurrections in Syria, Egypt, and Bulgaria kept his hands full. In 1802, S. set about carrying his theories into practice. He enlarged his council of state, restricted the power of the Grand Vizier, and introduced European methods of organisation into parts of the army. The Servian insurrection, however, and a war with England and Russia in 1807, greatly embarrassed him. Finally the Janissaries revolted, and on the 29th May 1807 S. was deposed. An attempt to replace him on the throne was the signal for his murder, July 28, 1808. S. was an enlightened and well-meaning ruler, but lacked the force of mind necessary to contend successfully with the difficulties of his situation.

Selim'no (Turk. Islimje and Islivni), a walled town of European Turkey, province of Eastern Roumelia, at the foot of the Balkans, 69 miles N.N.W. of Adrianople, has 30 mosques, a Greek church, and a synagogue. There are some manufactures of cloth, &c., and some wine is produced. A great annual fair is held here. Pop. 24,000.

Sel'juks, or **Sel'juk Turks**, a branch of the Mongol race, who first appear in the 10th c. A.D. as tributaries of the Khan of Kirghiz, but who about 970, headed by a chieftain of the name of Seljuk, established their independence, embraced Islam, and under Israel, Seljuk's son, made themselves masters of Bokhara. Forced by Mahmud of Ghizni to cross the Oxus and settle in the waste districts of Khorassan, they soon began to overrun Persia, and Masud, the successor of the Ghiznide conqueror, vainly endeavoured to arrest their progress. Toghril Beg, the grandson of Seljuk, whom they elected for their sovereign, made Nishapur his capital, but in 1055 was invited to Bagdad, to defend the Khalif against his Bouide protectors. He followed the summons, and shortly after his entry into Bagdad was himself solemnly proclaimed sultan, the Arabian Empire of Islam passing under his successors Alp Arslan (1063-72) and Malek Shah (1072-92) entirely to the Seljuk race. Malek's dominion, indeed, extended from the Chinese frontier to the Georgian mountains and the groves of Arabia Felix. However, upon his death this immense territory was partitioned amongst a number of Seljuk chieftains, and thus arose the shortlived sultanates of Iran (1093-1194), Iconium or Rum (1075-1299), Aleppo (1079-1114), Damascus (1076-1155), &c., whose fall was due partly to the assaults of crusaders, partly to the daggers of the Assassins (q. v.), and partly to intestine feuds. Ere the close of the 13th c. the last of them, the sultanate of Rum, had fallen into the hands of Tartar invaders, and on its ruins arose the present Ottoman Empire. See R. D. Osborn's *Islam under the Khalifs of Bagdad* (Lond. 1878).

Sel'kirk, the capital of the county of S., on a rising-ground on the right bank of the Etrick, 40 miles S.S.E. of Edinburgh by rail. The chief features of the place are the town-hall, with a fine spire, and the county buildings (1870). There are monuments to Sir Walter Scott and Mungo Park, a native of the county. S. is now famous for its manufacture of tweeds, tartans, blankets, plaids, shawls, and hosiery. Pop. (1871) 4640. It unites with Galashiels and Hawick in returning a member to Parliament. S. derives its name from the 'kirk' or chapel built for the Scottish kings when hunting in the forest of Etrick. Here a monastery was founded by David I. in 1173. The town

possessed considerable importance in early times. It sent 100 men to Flodden under the town-clerk, of whom only 4 returned, but bearing a banner torn from the enemy. The stubborn bravery of the citizens was rewarded by James V. with a new charter and a grant of 1000 acres of forest. S. was early famous for its manufacture of shoes, the 'single-soled shoon' of the ancient ballad. From the town records it appears that, when the Highland army in 1745 demanded 6000 pairs of shoes from the city of Edinburgh, more than one-half were supplied by S. The 'Souters of S.,' long so famous, are still commemorated in the ancient ceremonies at the admission of a burghess of the borough.

Selkirkshire, a county of Scotland, surrounded N. by Edinburgh, W. by Peebles, S. by Dumfries, and E. by Roxburghshire. Area, 166,524 acres; pop. (1871) 14,005. It is 28 miles from N. to S., 18 miles from E. to W., and consists chiefly of the vales of Ettrick and Yarrow, and separated by a ridge of pastoral hills. Blackhouse Hill (2370 feet) and Minchmoor (2280 feet), on the borders of Peeblesshire, Windlestrae Law (2295 feet) at the N. extremity, and Ettrick Pen (2200 feet) on the S.W. boundary, are the only elevations above 2000 feet. The Ettrick (q. v.) is the principal river. It rises in the S.W., and flows N.E., receiving the Yarrow (q. v.) a little above Selkirk, and joining the Tweed on the E. border of the county after a course of 30 miles. The Gala and Cawdor water the N.E. portion. S. contains two lochs, both formed by the Yarrow—St. Mary's Loch (3 miles long, $\frac{1}{2}$ mile broad, 80 to 90 feet deep), and the Loch of the Lowes (1 mile long, $\frac{1}{2}$ mile broad, 70 feet deep), both at an elevation of more than 500 feet above the sea. The county contains few minerals. Whinstone and granite are abundant. The uplands have excellent pasturage. In 1876 there were under corn crops 5325 acres; green crops, 3454 acres; clover and grasses under rotation, 7676 acres; permanent pasture, 6236 acres. In the same year there were 568 horses (used for agriculture), 2572 cattle, 162,719 sheep, and 447 pigs. The rental for 1877-78 (including burghs) is £114,519, excluding railways. In 1674 it was 80,307 pounds Scots, or £6692 sterling. The principal places of interest in the county are the field of Philiphaugh, where Montrose was defeated by Leslie in 1645; and the ruined castles of Oakwood, the residence of Michael Scott; Tushielaw, the stronghold of Adam Scott, 'king of the border'; the 'Dowie Dens of Yarrow,' Newark, where the *Lay of the Last Minstrel* was sung to Anne, Duchess of Monmouth, and 'Bowhill,' the chief residence of the Duke of Buccleuch.

Selters Water, commonly called **Seltzer Water**, takes its name from the village of Lower Selters, near Limburg, in the duchy of Nassau, where several springs, united in one basin, yield 5000 cubic feet an hour. The altitude of the springs is 800', and the temperature 62° F. According to Kastner's analysis, the water holds in solution the bicarbonates of soda, lime, magnesia, iron, and manganese; the chlorides of sodium and potassium; the sulphate of soda; the phosphates of lime, of alumina, and of soda; the fluoride of calcium; the bromide of sodium; and silica. The gases are carbonic, nitrogen, and oxygen. The dose is from a wineglassful to a tumblerful, and at the Spa the gas is often allowed to escape. S. W. acts as a mild stimulant of the mucous membranes, and as a diuretic, promoting the secretions generally, and particularly of the skin and kidneys. It is recommended in chronic disorders of the digestive, respiratory, and urinary organs, and in liver complaints. The spring was discovered early in the 16th c., but was at first so slightly valued as to be rented, even in the middle of the 18th c., at 4s. per annum; whereas it is said now to afford a revenue of above £6000.

Selwyn, George Augustus, D.D., born at Hampstead in the summer of 1809, proceeded from Eton to St. John's College, Cambridge, where he distinguished himself as well by rowing seven in the first University Boat Race (1829), as by graduating second classic (1831). Elected fellow of his college, he resided at Eton as tutor to Lord Powis's son and curate of Windsor until 1841, when he accepted the newly-founded bishopric of New Zealand 'at a moment's notice,' says Mr. Gladstone, 'upon the call of duty tearing up the singularly deep roots which his life had struck into the soil of England.' Six-and-twenty years, broken by a single visit to England (1854),

were spent in frequent journeyings afoot and perilous cruises by sea, in warmly espousing the cause of the Maori remnant and building up a flourishing church on apostolic models. When in 1867 he again revisited England to attend the Lambeth Conference, he left behind him six suffragan bishops and seventeen native clergy, and with a good heart as Bishop of Lichfield could turn from Southern cannibals to minister to English navvies, bargees, and prisoners. He returned, however, to New Zealand in 1868, to set things in order for his successor, and was present at the General Convention of the American Church at Baltimore (1871) and New York (1874). In England he established diocesan synods, instituted a system of theological examinations, and lived in his own cathedral city, where he died 11th April 1878. His long life had left him no time to publish anything beyond some charges, sermons, and letters, but the memory of his eloquence, manliness, charity, and loyal churchmanship will outlive that of many a classic-editing prelate. The S. Memorial Fund, started at Lichfield on 26th April, and intended either for a monument to the bishop or for a college to be founded at Cambridge, amounted in August 1878 to £16,200. See an article, 'Bishop S.,' in the *Church Quarterly Review* for July 1878, and *Life of S.*, by the Rev. H. W. Tucker (Lond. 1878).

Semaphore (Gr. *sēma*, 'a sign,' and *phērō*, 'I bear'), a name first applied by the French to a kind of telegraph consisting of a mast with pivoted arms capable of being turned round to any position by cords or levers. The different combinations of the arms may represent letters of the alphabet, or numbers which may have their equivalent expression in a tabulated code, and by repeating the signals along a series of similar contrivances, erected on elevations at intervals of a few miles, intelligence can be rapidly communicated to distant parts. Many kinds of semaphores were in use before the invention of the electric telegraph, which has wholly supplanted them for telegraphic purposes. Chappe's improved S. was originally (1794) erected between Paris and Lisle, and news of the recapture of the latter place was conveyed within an hour to the capital by means of this S.; it was also set up on the French coast in 1803. In 1796 the Admiralty adopted a modification of the Rev. Mr. Gamble's 'shutter' S., or telegraph, and established a line of them between London and Dover. It had six panels rotating in a frame, and any or all of them could be rendered invisible by turning them horizontally, so as to present the edges to the spectator. Captain Pasley's 'polygrammatic' telegraph, based on the original French S., was introduced in 1809. With three pairs of arms it was capable of giving numerous combinations. Simplicity, however, was of greater consequence than the power of making many signals, and accordingly, in 1816, Sir H. Popham's S. was selected by the Admiralty to replace the other kinds in use. The two arms afforded forty-eight signals, amply sufficient for the alphabet, numerals, and arbitrary signs. Popham also designed a semaphoric apparatus for naval use. The simple S. is still employed on railways to regulate traffic. In an extended sense, S. signifies any visible means of communicating intelligence to distant parts, as beacons, flag-signals, &c.

Semaphores.

Semecarpus (Gr. *Sēmeion*, 'a mark,' and *karpōs*, 'fruit') is a genus of *Anacardiaceæ*, of which *S. Anacardium* is known as the 'marking nut tree.' It is a moderate-sized tree, abundant in most parts of India. The wood is full of acrid juice, which causes swelling and irritation; the bark is used for dyeing. The thick fleshy receptacle of the ripe fruit is eaten when roasted, and from the acrid juice of the pericarp a black varnish is prepared, which, mixed with limewater, is permanent for marking purposes, and can be rendered black immediately by the addition of ammonia. This juice and the seeds are also employed in native medicines.

Semen'dria (Serv. *Smederevo*), a fortified town of Servia, on the right bank of the Danube, and at the mouth of the Jessava, 30 miles S.E. of Belgrade. Formerly a residence of the Servian kings, it has an old citadel and a palace (*konak*), and in the vicinity is the beautiful church of St. George, with five cupolas. S. is surrounded by extensive vineyards and mulberry-groves, and exports large quantities of swine. Pop. (1874) 5107.

Semi-Arians were the party in the Church in the 4th c. who desired to hold a middle course between Sabellianism (q. v.), which converted the distinction between the persons in the God-head into one of modes, and Arianism (q. v.), which subordinated the Son to the Father so far as to make the former a creature of the latter. This was indeed what the Athanasian party desired to do, but the S.-A. considered that the expression *homoousios* ('of the same substance'), which had been adopted in the Nicene Creed (325) to express the relation of the Son to the Father, came dangerously near Sabellianism, and hence they adopted the phrase *homoiousios* ('of similar substance'). The party was so strong that the Nicene Creed was only finally adopted as the doctrine of the Church at the Council of Constantinople (381).

Semibreve, the longest note in general use in music.  The breve, sometimes used in Church music, is twice its length, but the S. is practically the unit of musical duration, all other notes being proportionately less. See NOTATION, MUSICAL.

Semidemisemiquaver, a musical note, one-half the length of a demisemiquaver, one-eighth that of a quaver, and one-sixty-fourth that of a semibreve.  See NOTATION, MUSICAL.

Seminoles, a tribe of American Indians, formerly inhabiting central Florida. They are a branch of the Creek tribe, from whom they received their name, which means 'vagrant.' They were allies of the British during the Revolution. From 1794 to 1823 they carried on an intermittent series of border forays, giving refuge to fugitive slaves, whom, however, they agreed to deliver up by a treaty in 1823. In 1832 a few of the tribe concluded a fraudulent treaty for the sale of their lands in Florida, for a sum of money and a reservation beyond the Mississippi. The rest of the tribe, under the chief Osceola, repudiated this treaty, and a war began which cost the U.S. \$10,000,000 and 1500 lives. It ended in the submission of the S., most of them being transported to the Indian territory beyond the Mississippi, while some settled on the Rio Grande, and a handful remained in Florida. In 1874 those in Kansas numbered 2438, cultivating 8000 acres of land. Presbyterian missions and schools to the number of five have been established among them, and they receive from the U.S. Government an annuity of \$25,000.

Semipalatinsk (*Semi Palat*, 'seven palaces,' whose ruins lie near the town of S.), a military province of Asiatic Russia, organised in 1854, lies S. of the government of Tomsk, bordering W. on the Kirghis steppes, S. on Turkestan, and E. on Chinese Songaria. Area, 188,293 (lakes 14,200) sq. miles; pop. (1873) 510,163. S. is mostly mountain-land, with many streams, the chief of which are the Irtysh, discharging into Lake Zaisan, and the Ili, falling into Lake Balkash. The inhabitants are Kirghis of the Great and Middle Hordes, Russians, and immigrants from the Chinese Empire. The chief occupations are the rearing of sheep and cattle, hunting, fishing, gold-washing, and silver, lead, and copper mining.—S., the capital, on the right bank of the Irtysh, 507 miles S.S.E. of Tomsk, has a Cossack garrison, is an important trade-mart, and has two annual fairs. It was founded in 1718, and became a frontier customs' station in 1754. Pop. (1873) 10,140.

Semi-Pelagianism was a form of doctrine first propounded (soon after 432) by John Cassian, a disciple of Chrysostom, which for thirty or forty years was the prevailing form of doctrine in Gaul, to the exclusion of Augustinianism. The monks of the West, while condemning Pelagianism (q. v.), disliked the Augustinian doctrines of Predestination (q. v.) and Free Grace, as cutting at the root of the meritoriousness of good works. As opposed, then, to the Pelagian doctrine that the sin of Adam injured only himself, the semi-pelagians held that the moral effect of the Fall (q. v.) passed on all men, affecting both body and soul: rendering the body mortal, and weakening the soul in

all its powers for good. As opposed to Augustine, they held (1) that the beginning of salvation is with man himself; (2) that this inceptive turning of the soul to God is in one sense meritorious; (3) that the soul, in virtue of its power of will, co-operates with the grace of God in regeneration as well as in sanctification.

Semi-quaver, a musical note, one-half the length of a quaver, and one-sixteenth that of a semibreve. See  NOTATION, MUSICAL.

Semi-Quietism. The name of semi-quietists was given to Madame Guyon, Fénelon, and others, who adopted some of the tenets of Quietism (q. v.), while avoiding the extremes into which Molinos (q. v.) fell.

Semiramis, according to Ctesias, the wife of Ninus, and the founder with him of Nineveh in 2182 B.C., who after a glorious reign of forty-two years abdicated in favour of her son Ninyas. M. Lenormant, however, shows that both S. and Ninus are wholly mythological in their character, the personages probably of an epic similar to Firdusi's *Shah-Nameh*, she being identical with Beltis wife of Bel, the second person in the Chaldean Triad, and Ninus a personification of the might of Nineveh. Gradually the myths that clustered round their names came to be looked on as historic documents, from which the Adiemenes drew arguments in favour of their policy, and Ctesias may have found the substance of his narrative enshrined among the archives of the state. The S. mentioned once by Herodotus (i. 184) as being a queen of Babylon, who lived five generations before Nitocris, was the wife of Vul-lush (810-781 B.C.), according to Rawlinson, of Bin-lik-his III. (857-828 B.C.), according to Lenormant, and appears on the monuments as Sammuremat. See Lenormant, *La Légende de Semiramis* (Bruss. 1877).

Semitic Languages. The term Semitic, now used to designate one of the great families of language, is derived from the name Shem in Gen. xi. 21, and was brought into general use early in the present century, chiefly through the recommendation of Schlozer and Eichhorn. It having been since shown to be far from accurate, the attempt has been made more than once to substitute for it some more scientific appellation, such as Syro-Arabic, which, like Indo-European, would describe the family by its geographical extremes. The older word, however, has become too firmly fixed in the literature of learned Europe to make such a change now practicable; and, viewed simply as a conventional term whose meaning is perfectly defined, it is as convenient as any other. The S. L. fall into three groups:—1. The Aramaic or Northern; 2. The Hebrew or Middle; 3. The Arabic or Southern. Of dead languages, the Aramaic embraced Biblical, Masoretic, Talmudic and Targumic Chaldee, the Syriac, and the language of the cuneiform inscriptions of Nineveh and Babylon; the Hebrew included Biblical Hebrew, the dialect of the Samaritan Pentateuch, and that of the Carthaginian-Phœnician inscriptions; while to the Arabic belonged Ethiopic and the Himyaritic inscriptions. The living representatives of these three branches are respectively the Neo-Syriac, spoken by the Nestorian Christians, the factitious Hebrew used by the Jews among themselves, and the Arabic and Amharic. The boundaries within which the S. L. are spoken have hardly ever changed, and may be generally described as the mountains of Armenia in the N., those which limit the Tigris basin on the E., and the Red Sea with certain portions of Asia Minor on the W. The only extensions beyond these limits have been, first, that temporarily effected by the Hebrew through the planting of Phœnician colonies on the N. of Africa; and secondly, the more permanent extension of the Arabic following upon the Mohammedan conquests. The severe simplicity and unbending conservatism of the Semites have strongly impressed themselves on their language. All the various dialects, although varying in the richness of their vocabulary, are closely connected with one another, as far as regards the prevailing root-forms and their meanings. This is no doubt greatly owing to the fact that in the Semitic root, which was probably originally biliteral, although now generally appearing as trilateral, consonants are alone of determinative value. As regards grammar, here again the difference between the three branches consists almost entirely in the different degrees of richness of inflectional forms; the Arabic possessing the greatest number, the Hebrew next, and the Aramaic the least. The mode of

Inflection is substantially the same in all, and is chiefly internal; that is to say, a simple modification of the vowels within the verbal stem, conjoined sometimes with the addition of a preformative consonant, serves to add intensity, repetition, causality, passivity, or reflexion to the verbal idea. Compound words, except in the case of proper names, are quite foreign to the Semitic genius, and in the antique Hebrew are almost unknown. The noun has few inflections, and only possesses what can be called declension in the Arabic, where it is obviously inessential. The syntax is of such a simple character as to offer a marked contrast to the elaborate style of the Western languages. Conjunctions are few, a mere connecting particle often serving to co-ordinate where we would subordinate. There is nothing which properly corresponds to the *period* of Latin or Greek, for the prose style merely consists in building up simple sentences, without any attempt to express the subtle degrees of logical connection between them to which the Aryan dialects lend themselves so easily. In poetry, metre and rhyme are replaced by parallelism, a species of thought-rhythm, in which two simple propositions are balanced against one another in any logical relation. The S. L. are emphatically the languages of the concrete and actual, and have no inherent capacity, such as we see in those of the Aryan family, for dealing with the abstract and ideal; while metaphysics in our sense of the word is impossible. In them everything is painted from its external appearance, so that even moods of the mind are denoted by words which describe a physical condition; e.g., pride by *lifting up of the head*, patience by *length of breath*, impatience by *shortness of breath*, anger by *hard breathing*, or *heat*, or *effervescence*. They are thus specially distinguished by the manner in which the primitive union of the sensation and the idea has preserved itself, without either element causing the other to be forgotten. The purest type of the S. L. is undoubtedly the Biblical Hebrew. The very richness of the Arabic, and its comparative adaptation to alien modes of thought, is necessarily accompanied by great looseness and a considerable influx of foreign ingredients; while the Aramaic, occupying a middle position between these two in respect of development, wants the classic simplicity and delicate mobility of the one, without having reached the cosmopolitan variety of the other. That the alphabets of the civilised world were of Semitic origin was long regarded as an indisputable truth. Like more important matters, however, it is now seriously questioned. None deny that the Phœnician Symbols are the sources of the Greek and Latin letters, and of all their modern progeny, but many scholars are of opinion that the Phœnician alphabet is a mere survival from the more primitive picture-alphabets known as hieroglyphics. See Rénan's *Histoire Générale des Langues Sémitiques* (4th ed. Par. 1864); Gesenius's *Geschichte der Hebräischen Sprache und Schrift* (Leip. 1815, § 1); Havernick's *Introduction to the Old Testament* (vol. i. chap. 2); Bleek's *Introduction* (vol. i. chap. 3); De Wette's *Einleitung* (Div. ii. chap. 1), and Keil's *Einleitung* (§§ 8-13).

Sem'itone, in music (lit. 'half a tone'), is one of the smaller intervals in the scale, as from B to C (see MUSIC). A chromatic S. is when a note is altered by a sharp or flat.

Sem'ler, Johann Salomo, one of the earliest German rationalists, was born at Saalfeld, 18th December 1725, studied at Halle, where he was appointed professor of theology in 1751, and died 14th March 1791. His writings are numerous. Though no longer read they have a place in the history of theological criticism. We may note his *De Dæmoniis* (1760); *Apparatus ad liberalem Veteris Testamenti Interpretationem* (1773); *Abhandlung von der Untersuchung des Kanons* (1771-75), and *Commentationes Historiæ de antiquo Christianorum Statu* (1771-72). See his *Lebensbeschreibung von ihm selbst verfasst* (Halle, 1781-82); Wolff, *Ueber S.'s letzte Lebensstage* (Halle, 1791); Schmid, *Theologie S.'s* (Nordl. 1858).

Sem'lin, a town of Austria, on the Danube opposite Belgrade. It is the centre of a great transit trade between Austria and the former provinces of Turkey—these provinces receiving mostly glass, porcelain, and jewellery, and exporting yarns, cotton, skins, honey, &c. S. contains a lazaretto, and is an important quarantine station. There are seven churches—five Roman Catholic—and a theatre, but the town is composed largely of mud huts. Pop. (1870) 10,046, chiefly Servians.

Semm'ering, a mountain of Styria, in Austria, 44 miles W. of Vienna, and 4416 feet high. The S. Pass (3066 feet high) is crossed by the railway from Vienna to Trieste, which is carried through fifteen tunnels and over fifteen viaducts, and which cost £1,500,000. The highest point of the line is 2894 feet. It was the first mountain-railway (opened 1854), and is still one of the most remarkable.

Semnopithe'ous, a genus of *Catarrhine* or Old World Apes, occurring in the E. Indies, to which the *S. Entellus*, or Sacred Monkey of India, belongs. The tail is prehensile; the canine teeth are well developed, and the molars are tuberculate.

Semoli'na and **Sem'ola** are names for particles of the grain of hard wheat which do not grind into flour in milling, or are sometimes designedly prepared by the adjustment of the mill-stones. These hard wheats of S. Europe have a nearly transparent grain, which, when bitten through, breaks short and shows a very white flour within. The flour is much richer in gluten than that of soft wheats, consequently the bread, puddings, &c., made from S. are good flesh-forming food. See MANNA CROUP.

Semp'ach, a small town in the Swiss canton of Lucerne, at the S.E. end of the lake of S., and 8 miles N.W. of Lucerne. Near the town a decisive victory was gained by the Swiss Eidgenossen ('confederates'), July 8th, 1386, over the Austrians under Duke Leopold, who was slain in the battle at a spot now marked by a chapel, 1½ miles from S. A high mass is still celebrated on the anniversary. Pop. (1870) 1109.

Sempervi'um. See HOUSE-LEEK.

Sen'ate (Lat. *senatus*, 'an assembly of elders,' from *senex*), a name applied rhetorically to any legislative and deliberative body, but in several modern democracies denoting distinctively the 'upper house.' The Roman S. was a hereditary and not an elective body. The S. of the United States consists of two delegates nominated by the House of Representatives of each state. The French S. is composed of 500 members, 225 being elected by the departments and colonies and 75 by the National Assembly. In some of the Swiss cantons there is a second house known as the S.

Sena'tus Academ'icus, one of the governing bodies of the Scotch universities, composed of the principal and professors. The principal presides, or in his absence the senior professor, and has a casting as well as a deliberative vote upon all questions which may come up. The S. A. controls the university property and revenues, regulates discipline, and confers degrees.

Sen'eca, M. Annæus, a Latin rhetorician, was born at Corduba (Cordova) in Spain, probably about 61 B.C. The wars between Pompey and Cæsar kept him at home for a time, so that he had not the privilege of listening to Cicero. He was certainly in Rome during the early years of the power of Augustus. S. was a friend of M. Porcius Latro, one of Ovid's masters, and had heard Ovid declaiming before Arellius Fuscus (*Contr.* x. p. 172). After his sojourn in Rome he returned to Spain and married Helvia, by whom he had three sons, L. Annæus S., L. Annæus Mela, and Marcus Novatus. He lived till the close of the reign of Tiberius, but the exact date of his death is unknown. Whether or not he died at Rome is uncertain, but that he died in Italy is undoubted. S. was a man of wonderful memory. His principal work is *Controversiarum Lib. Decem*, a series of commonplace rhetorical exercises written in his old age. The first, second, seventh, eighth, and tenth books only are extant; even these are imperfect. A few fragments of the other books have survived. The *Suasorium Liber*, probably incomplete, is, like the former, surcharged with the puerilities of the rhetoricians. The most noteworthy editions of the works of S. are those of Ven. 1490-92 fol.; Basel, 1515-29 fol., and 1537-57 fol., by Erasmus, in all of which the writings of the father are mixed with those of the son; Nic. Faber (Par. 1587-98 fol.); Andr. Schott (Par. 1607-13 fol.); J. Fr. Gronovius (Leyden, 1649); first critical edit. by Conr. Bursian (Leip. 1857); and that of A. Kiessling (Leip. 1872).—**L. Annæus S.**, son of the preceding, was born at Corduba towards the close of the 1st c. B.C. While still young he was brought to Rome, where he entered on the study of rhetoric and philosophy. His first teacher was Sotion the Pythagorean, but he afterwards became a follower of Attalus

the Stoic. After travelling in Greece and Egypt he became a successful pleader; but the jealousy of Caligula, who affected to despise his talents, drove him from the bar. At what time he obtained the quaestorship is uncertain. In the reign of Claudius he was banished to Corsica (A.D. 41) in consequence of an alleged illicit connection with Julia, daughter of Germanicus. S. remained eight years in exile, during which he cultivated the philosophy of the Stoics and wrote several treatises. In one of these—the *Consolatio ad Polybium*—his excessive adulation of the Emperor and his whining appeals for pardon are ignoble. Recalled in 49 A.D., at the instance of Agrippina, who had married her uncle, the Emperor Claudius, S. was then raised to the praetorship and appointed tutor to Nero (q. v.), the son of Agrippina by a former husband. The philosopher was most unfortunate in his pupil; yet he successfully adapted himself to the situation. Though he could not restrain the depraved passions of the imperial miscreant, he profited largely by his extravagant bounty. The immense wealth he thus acquired, estimated at 300,000 sesteria (£2,412,870 sterling), was one of the main causes of his ruin. Nero envied him a fortune which S. offered to refund, asking only a small annuity. Nero, while declining the proffered gift, tried to take off S. by poison. The attempt failed. Shortly thereafter, one Antonius Natalis, an accomplice of Piso, implicated S. in a conspiracy against the emperor's life. The philosopher was sentenced to die by his own hand. He elected to be bled to death. His wife Paullina wished to die with him, but this favour Nero would not concede. As S. was attenuated by age and spare diet his blood flowed but slowly; he was therefore taken at his own request to a warm bath. Finally he was removed to a vapour-stove, where he was speedily suffocated (65 A.D.).

The following are the works of S.:—1. *De Ira*; 2. *De Consolatione ad Helviam Matrem Liber*; 3. *De Consolatione ad Polybium*; 4. *De Consolatione ad Marcianum*; 5. *De Providentia Liber*; 6. *De Animi Tranquillitate*; 7. *De Constantia Sapientis*; 8. *De Clementia ad Neronem Casarem Libri Duo*; 9. *De Brevitate Vitae ad Paulinum Liber*; 10. *De Vita Beata ad Gallionem*; 11. *De Otio aut Secessu Sapientis*; 12. *De Beneficiis Libri Septem*; 13. *Epistolae ad Lucetium*; 14. *Apocolocyntosis*; 15. *Questionum Naturalium Libri Septem*. Wanting in speculative reach, S. yet shows no ordinary mental vigour, and a wide and varied knowledge of human life. His style is antithetical; his language clear and strong; his treatment of a subject invariably attractive. It remains still to notice the tragedies ascribed to S. by Quintilian, and generally included in editions of his works. Whilst some would attribute these to his father, and others to another S., there seems to be great difficulty in assigning them to any other than the S. of our article. They are, it is true, in many places turgid and bombastic, and were certainly never meant for the stage; but like the other works of S., they abound in moral sentiments, and are not destitute of merit. Considered as a drama, the *Octavia*, which many critics violently condemn, mainly on the ground that they believe it to belong to a later age, is perhaps the best. The influence of the tragedies of S. on the French dramatists has been very marked. Racine especially has been much indebted to them. The *Editio princeps* of S. is that of Naples (1475, fol.). Among several competing French translations, that of Lagrange is considered the best. Of the English translations of S., or of separate treatises, no one demands special notice. The best edition of the prose works are those of Fickert (3 vols. Leip. 1842-45), and Haase (3 vols. Leip. 1852-53; new ed. 1871); of the *Tragedies* those of F. H. Bothe (Leip. 1819, 2 vols. 8vo., and 1834); R. Perper and G. Richter (Leip. 1867).

Seneca Lake, in New York, U.S., is 35 miles long, and is navigated by steamers. Its surplus waters flow into Lake Ontario, and at the outlet stands the rising town of Seneca Falls. The lake takes its name from the Seneca Indians.

Senecio (Lat. *senex*, 'an old man,' from the abundant hoary pappus) is the name of a vast genus of *Compositae*—one of the largest among phænogamous plants, and certainly the most widely spread. It is, however, most varied in temperate and cool or mountain regions. No species is common to the New and the Old World, except in the far north. S. embraces annual and perennial herbs, undershrubs, and shrubs almost passing into trees. The essential character of the genus is an involucre

of one-seriate bracts of equal length, with often a few smaller at the base. The leaves are extremely variable in outline and clothing. The genus *Cineraria* is now considered a section of S., and to it belong the beautiful greenhouse ornaments obtained by horticultural skill from *S. populifolius*, *S. Tussilaginis*, &c. Nine species of S. appertain to the British flora. A few possess medicinal properties, e.g., a variety of *S. aureus* known as 'life root' and 'squaw weed' in N. America. See **GROUNDSEL** and **RAGWORT**.

Senefé, a village in Hainault, Belgium, 17½ miles N.E. of Mons by rail, was the scene of the defeat of 60,000 Dutch, Spanish, and Imperialist troops under William of Orange by 30,000 Frenchmen under the great Condé, August 11, 1674. Both armies lost about 10,000 men.

Sen'ega, or **Sen'eka**, popularly termed *snake-root*, is the root of *Polygala Senega*, a small herbaceous perennial, indigenous to the middle and Southern States of America. 'This root is several inches long, very much contorted, of a peculiar feeble odour, and a taste at first sweetish but afterwards acrid. It is distinguished by a keel-like line, shorter than the root, and presenting the appearance as if a string were drawn tightly under the bark from end to end.' S. is a stimulant to the mucous membrane of the lungs, and is valuable in cases of chronic bronchitis.

Senegal, a large river of Western Africa, rises in a mountainous region in 11° N. lat., 11° 20' W. long., and flows successively N., N.W., and W.S.W., falling into the Atlantic after a course of 1000 miles. Its mouth is obstructed by a sand-bar, covered with only 9 feet of water, and its channel is in various places broken by cataracts and rapids. With these exceptions it is navigable by flat-bottomed craft for 740 miles. In its lower course the river forms numerous islands, which are periodically overflowed, and thus rendered very fertile. The name S. is also given to the French possessions in Senegambia.

Senegambia, an extensive region of Western Africa, deriving its name from its two principal streams, the Senegal and Gambia. It borders on the Atlantic from 10° 20' to 18° N. lat., and is bounded N. by the Sahara, E. by the Sudan, and S. by Sierra Leone. Area, about 400,000 sq. miles; pop. estimated at 12,000,000. High S., the district to the N. of the Senegal, partakes of the nature of the Sahara, into which it merges, and is inhabited by Moors. Middle S., between the Senegal and Gambia rivers, is an extremely unhealthy though usually fertile region, and has a Negro population. Low S., from the Gambia southwards, possesses a coast deeply indented by arms of the sea, fringed by islands and watered by several rivers, of which the Rio Grande and Nuñez, both navigable streams, are the chief. The coast region of Middle and Low S. is low and flat, and the country rises towards the interior by a succession of terraces to the Kong Mountains, forming in its upper portion a plateau about 2500 feet high. In the hilly districts iron is very abundant, and gold is also found. The vegetation, especially of the river basins, is luxuriant, and among its characteristic features is the gigantic baobab (see **ADANSONIA**). Gum, wax, bark, indiarubber, ivory, and hides are the chief natural productions of S.; but cotton, cocoa, and indigo are beginning to be cultivated. The French possess 96,530 sq. miles of S., extending from its northern limit to 13° 30' N. lat.; the British have some settlements on the Gambia river (see **GAMBIA**); and the Portuguese exercise a nominal sway over 35,880 sq. miles of territory, lying between the last-mentioned settlements and Sierra Leone.

Sen'eschal (through the French from a German compound meaning 'aged servant'), a Frankish title of dignity, corresponding to the Eng. Steward, or High Steward. Originally lieutenants of the dukes and other great feudatories, the seneschals, on the recovery by the kings of their rights of suzerainty, continued as royal judges and deputies; but gradually their functions were superseded by the authority of the crown.

Se'nior, William Nassau, born at Uffington, Berkshire, 26th September 1790, passed from Eton to Magdalen College, Oxford, and took a first class in classics (1811). Called to the bar in 1818, he twice held the chair of political economy at Oxford (1825-30 and 1847-62), was appointed a poor-law commissioner (1832), as such having a large share in the Poor-Law

of 1834, and was a Master in Chancery (1835-53), examiner in political economy at the London University, and a commissioner of national education. S. travelled much, the fruits of his travels being Journals kept in Turkey and Greece (1859), in Ireland (1868), and in France and Italy (1871). His social position, too, gaining him entrance to the best literary and political circles of Parisian society, a natural aptitude enabled him to reproduce the opinions of many leading French statesmen and authors in his note-books, selections from which have been edited by his daughter, Mrs. Simpson, under the title *Conversations with Thiers, Guizot, and other Distinguished Persons during the Second Empire* (2 vols. Lond. 1878), and form a work of the greatest political value. S. died at Kensington, 4th June 1864. Amongst his other works were a *Treatise on Political Economy*, reprinted from the *Encyclopædia Metropolitana* (1853), *Biographical Sketches* (1863), *Essays on Fiction* (1864), and *Historical and Philosophical Essays* (2 vols. 1865), collected from the *Edinburgh* and other periodicals.

Senlis (Lat. *Civitas Sylvanectensium*, 'the town of the dwellers in the woods'), a town of France, department of Oise, 33 miles N.E. of Paris by rail, is picturesquely situated on a small hill on the river Nonette. It has a small but beautiful Gothic cathedral, and a château of the time of St. Louis, as well as several Roman remains. The inhabitants are principally employed in weaving, spinning, and lace-making. Pop. (1876) 6545.

Senna. This important drug is simply the dried leaflets of various species of the large leguminous genus *Cassia* (q. v.). The medicinal species are shrubs, undershrubs, or herbs, with pinnate, non-glandular leaves of unequal-based leaves, flowers in axillary racemes, pods flat, broad, arcuate, and dehiscent. They are natives of tropical Africa—three species extending to N.W. India, and two reaching also to the dry belt of S. India. Tinnevely, E. Indian, Somali or Aden S. is obtained from *C. angustifolia* of Vahl (*C. elongata* of Lemaire), a bushy herbaceous plant with five to eight pairs of narrow ovate-lanceolate leaflets. Alexandrian S. is in part the produce of *C. acutifolia* of Delile, and in part that of *C. obovata* of Colladon, the first an undershrub with lanceolate acute leaflets, indigenous or spontaneous in N. and tropical Africa and S.W. Asia, and the latter a diffuse procumbent perennial herb with glabrous, obovate, obtuse leaflets in three to seven pairs, native of tropical Africa and India. Tripoli S. is the yield of *S. Ethiopica* of Guibourt. *C. holosericea*, occurring in Abyssinia, Nubia, Arabia, and Scinde, furnishes a portion of both African and Indian S.; indeed, it generally happens that there is a mixture in the imports of S., not only of the leaves of different valuable species, but of stalks and pods, and designed or worthless substitutes, such as *Solihostemma Argel*, *Tephrosia Apollinea*, *Globularia Alypum*, and *Colutea arborescens*. In addition to the kinds of S. included in the British Pharmacopœia, that of the United States has an official *C. Marilandica*, or American S. It is used as a purgative, but is only about half as powerful as Alexandrianas. The pulp, which fills the long pods (12 to 24 inches) of *C. Fistula*, a common forest tree of India, is largely used as a laxative in Europe, and enters extensively into native medicine. It has been introduced into tropical America. In S. America the pulp of *C. Brasiliana* answers a like purpose. Several of the Australian desert cassias of the *C. artemisioides* group will probably prove to possess medicinal properties, as the odour of their foliage assimilates to that of S. The most important preparations of S. are a confection, an infusion, a syrup, and a tincture. It is considered an 'admirable cathartic, stimulating the peristaltic action, and affecting chiefly the small intestines. Its action, however, is frequently attended with nausea and griping, but less so if combined with a saline purgative,' and a little ginger, coriander, or anise corrects the griping property. *Colutea arborescens*, a native of the Mediterranean region, has large membranous inflated pods and S.-like leaves, possessing purgative properties—hence the shrub is called Bladder-S., and its leaves are sometimes mixed with S. proper.

Sennaar, a region of Upper Nubia, lying between the Atbara river and White Nile, and intersected by the Bahr-el-Azrek, or Blue Nile. Formerly an independent Negro state, it was forced to acknowledge the authority of Mehemet Ali in 1820, and has ever since been in vassalage to Egypt. Its capital, also called S., had once a large and flourishing trade, but is now a mean place

of 4000 inhabitants, while the trade of the region is centred in Khartum (q. v.).

Sennacherib, a king of Assyria (q. v.), son and successor of Sargon, reigned from 705-681 B.C. He engaged in a great war against Phœnicia, Egypt, and Judea. During this expedition his army was in some mysterious way utterly destroyed. The defeat is described in 2 Kings xviii. and xix. as occurring apparently at Libnah; it is referred to in Josephus' *Antiquities* (x. i), while Herodotus (ii. 141), probably reporting the Egyptian version, places the scene of the disaster at Pelusium on the Egyptian border, ignores Judea and Hezekiah altogether, and transforms the 'angel of the Lord' who smote the Assyrians into 'a number of field mice,' who, 'pouring in upon their (the Egyptians) enemies, devoured their quivers and their bows, and moreover the handles of their shields;' but it is not noticed in the Assyrian inscriptions, which describe only the victories of S. and the splendid palaces he erected. He died at Nineveh by the hands of his two sons, while he was praying in the temple of Nisroch. See George Smith's *Assyrian Explorations and Discoveries* (6th ed. Lond. 1877). Dr. Zeinhart Homing (1878) published the two most important inscriptions of S. known as the Taylor Prism and the Bellini Cylinder with a new translation, a commentary on the yet uninterpreted passages, a glossary, and the original cuneiform text.

Sens (Lat. *Civitas Senonum*, 'the town of the Senones'), a town in the department of Yonne, France, on the river Yonne, 70 miles S.E. of Paris by the Lyon railway. It is the seat of an archbishop, has a fine Gothic cathedral (completed 1184), a public library, important archives, a handsome theatre, an orphanage and hospitals, and has been the seat of several ecclesiastical councils. The neighbourhood abounds in Roman remains. S. has manufactures of small articles of hardware and of boots, and is the centre of a great corn, wine, wool, and timber trade. Pop. (1876) 12,309.

Sensation (in physiology), the term applied to the effects produced on the nerve-centres by impressions derived from without or within. In order that S. may be received and acted upon, three conditions are required. There must exist, 1. a *sense organ* at the external surface of the organism, for the reception of *impressions*; 2. a *special or sensory nerve* is required for the conveyance of the impression to, 3. the *nerve-centre*, where the impression becomes transformed into a *sensation*. S. may be divided into *common* and *special*. The former comprises those sensations which may be referred to the body as a whole; e.g., faintness, discomfort, itching, &c. *Special* sensations are the result of the action of certain organs adapted to receive impressions of one kind and no other. Thus the eye, ear, nose, and tongue may be called the seats of *special* sensations, since in each case the impression made gives rise in the brain to a special sensation, while each organ of special sense can appreciate one kind of impression alone. The eye is only sensitive to light-waves, and the ear similarly receives impressions of sound alone. Common sensations afford no information regarding ourselves, while special sensations supply us with a knowledge not only of ourselves, but of the external world. The *sensorium* or *brain* is the true seat of S. When we speak of seeing with the eye or hearing with the ear, our words are physiologically incorrect, inasmuch as the organs of sense are the mere 'gateways of knowledge,' and simply receive and transmit in appropriate form to the brain the impressions which in the brain give rise to corresponding sensations. We truly see and hear with the brain only.

Among the *internal* causes which affect S. may be mentioned the important effects of defective, increased, or abnormal circulation of blood through the brain, and the action of certain poisons which produce peculiar subjective sensations by the irritation of various parts of the sensorium. *External causes*, such as electrical stimulus, violence, and unusual sounds, also produce varying and peculiar effects in our sensory apparatus. All sensations, however, are liable to modification by training or neglect.

S. (in metaphysics) is a special form of feeling, as perception is a special form of knowledge, and is the recognition in consciousness of affections of the Ego by the Non-Ego. If a man smell a rose, he is conscious of an agreeable scent—is conscious of a S. If he attribute the scent as a quality to something external, he adds perception to S. There is in

every perception a subjective before an objective element. The relation of perception proper and S. proper towards each other has been shown by Kant to be such that they co-exist in the inverse ratio of each other. And thus it is that sensations upon which minimum attention is bestowed, while maximum attention is given to their concomitant acts of perception, are the best remembered. What has been seen is better remembered than what has been tasted. Sensations are popularly supposed to be given us by means of the five senses, but psychology reduces all five to a sense of touch. Everything made known by S. and perception must come into actual connection with an organ of sense. When we say that we perceive the sun, we speak of the result of a process of reasoning: what we really perceive is only a certain combination of rays of light, and what we have a S. of is only the impingement of these rays on the organ of vision.

Senses, the name given to the organs by which in higher animals a knowledge of the outer world is acquired. They are merely specialised parts of the nervous system, adapted for the reception and transmission to the brain of impressions of a special kind. Man's S. are regarded by physiologists as six in number; viz., Touch, Taste, Smell, Hearing, Sight, and the Muscular Sense, or Sense of Weight. All the S. are but modifications of touch, material contact of the sense-organ with the impressions it is destined to receive, being necessary for the exercise of each. Thus taste and smell each implies direct contact of the sense-organ with the particles of the matter to be tasted and smelt. There must be material contact of the light-waves with the *retina* of the eye before the sense of sight is produced; and the vibrations of the *tympa-num* of the ear represent the direct effect of sound-waves in producing the impression of sound.

Sensibility, the term used to indicate the degree or acuteness of sensation in various organs or tissues. It is well illustrated by E. H. Weber's experiments, in which the points of a pair of compasses sheathed in cork were used to test the varying S. of different parts of the body. In these experiments the tip of the tongue perceived the two points of the compass when they were separated to the extent of $\frac{1}{4}$ th of an inch only. The next most sensitive surface was the under or palmar surface of the tip of the forefinger, where two points were felt when the points were separated to the extent of $\frac{1}{4}$ th of an inch. The under surface of the second joint of the fingers felt the two points when they were separated to $\frac{1}{4}$ th of an inch; the mucous membrane of the under lip $\frac{1}{4}$ th of an inch; the tip of the nose $\frac{1}{4}$ th of an inch; the middle of the tongue $\frac{1}{4}$ th of an inch; palm of hand $\frac{1}{4}$ ths of an inch; centre of hard palate $\frac{1}{4}$ of an inch; dorsal surface of first joint of fingers $\frac{1}{4}$ th of an inch, and back of hand 1 $\frac{1}{4}$ inches; back of neck 2 inches; middle of thigh 2 $\frac{1}{4}$ inches.

Sensitive Plant, a name given to several plants from the motion displayed by their leaves under mechanical and other stimuli. The common S. P. of hothouses is a tropical American annual named *Mimosa pudica*. Its bi-pinnate leaves are united to the stem by an articulation, as also are the four or six pinnæ to the primary petiole, and the separate leaflets to their petiole. If the leaves are gently stroked by the hand, a general collapse of the leaflets takes place, and the leaf is bodily dejected. If the small cushions at the joints be touched with a point, the effect of the irritation is shown by the systematic closing of the leaflets, followed by the converging and drooping of the pinnæ and succeeded by the declination of the petiole. It is necessary, however, for this phenomenon to occur, that the temperature of the surrounding air be about 70-90° F. The S. P. closes its leaves spontaneously in the evening. The sensitiveness serves as a protection against the foliage being devoured by insect larvæ.

Sensorium, or **Sensory Ganglia**, a general name given to the brain, or to any series of nerve-centres, in which impressions derived from the outer world become localised, transformed into sensations, and thereafter transferred by *reflex action* (see NERVE) to other parts of the body. The term S. has sometimes been specially applied to indicate the series of organs in the brain, connected with the receipt of special impressions derived from the organs of sense. Thus, the *olfactory lobes*, *optic lobes*, *auditory ganglia*, &c., form parts of the typical S. in this latter sense. Dr. Carpenter's theory of the S. con-

sists in his recognition of the sensory ganglia as constituting the real S. He maintains that by means of these ganglia the mind becomes conscious of impressions made on the organs or parts with which they are directly connected by their special nerves. The older physiologists held the theory of a *S. commune*, which extended throughout the entire nervous system. Professor Cleland of Glasgow thinks the only tenable theory yet brought forward is that which maintains, 'that while consciousness is dependent on the encephalon (or brain), the S. extends thence, so far as there is, at any moment, unbroken continuity of nerves in the active or impressed condition.'

Sensory Impressions. See SENSATION and SENSORIUM.

Sentences, the verbal expression of thought or propositions, consist, according to grammarians, of two parts, the subject and the predicate, i.e., the thing thought of and what is thought of it. A Simple sentence contains but one subject or nominative, and but one predicate or verb, as 'Time flies'; but both subject and predicate may be enlarged by the addition of any number of modificatory words, so long as these do not form an independent sentence. Thus to the nominative may be tacked on an adjective, participle, appositional noun, &c.; to a verb an adverb, or, where it is transitive, an object, e.g., 'Winged time flies quickly,' or 'William the Conqueror invaded England.' A Complex sentence also has but one main subject and predicate, but contains two finite verbs, that part of it in which the main subject and predicate occurs being called the principal, the other the subordinate clause, as 'I know (principal) that he is dead (subordinate, etc.)'. Subordinate clauses, again, are variously termed nominal, adjectival, or adverbial, according as they represent a noun, adjective, or adverb, e.g. 'That he is dead is certain' = 'his death is certain' (nominal); 'The man that is wise prospers' = 'the wise man prospers' (adjectival); and 'He came as the sun rose' = 'he came at sunrise' (adverbial). Lastly, Compound S. contain two or more co-ordinate assertions, any one of which might have been made by itself, as 'Man dies, but God is immortal.'

Sentinel, **Sentry** (It. *sentinella*, from *sentire*, 'to hear' or 'perceive'), a soldier on guard. Sentries are placed before as depôts and guards, at tents and quarters of commanding officers, and at special places as required. At night a password must be given before the sentry allows any person to pass. In war, picket sentries are usually double, and only one person is allowed to approach at a time. Mounted sentries in outposts are called vedettes.

Senza Sordino, a direction in music denoting in the case of a violin that it is to be played without the mute. In pianoforte music *senza sordini* denotes that the dampers are to be removed, which is done by pressure of one of the pedals.

Se'pal. See CALYX.

Separate Estate, is the legal term denoting the property of a married woman, which she holds independently of her husband. As the legal doctrine is that a woman cannot hold property independently of her husband, the difficulty of her doing so can only be overcome by her divesting herself of her estate previous to marriage, and vesting it in trustees for her behoof. Such a deed is called a *Contract of Marriage* (see CONTRACT). It usually contains stipulations relative to life-rents, children's interests, &c.

Separation of Married Persons. For relative English law, see JUDICIAL SEPARATION, DIVORCE. In Scotland, in case of cruelty or desertion on the part of a husband, the Court of Session may, on the wife's petition, grant decree of separation, and find the husband liable to support her during its subsistence. Neither in England nor in Scotland are husband and wife entitled to live apart unless by common consent, or by decree of a court of law. See CONJUGAL RIGHTS, SUIT FOR RESTITUTION OF.

Se'pia, a genus of ten-armed *Dibranchiate* cuttlefishes, of which the *S. officinalis* of the Mediterranean Sea and elsewhere is the best-known example. The *S. officinalis* is occasionally captured on British coasts. The eggs are aggregated in masses, looking like grapes, and are hence popularly known as 'sea-grapes'. The colour is a whitish brown, with dark-brown stripes on the back.

Sepia is India Ink (q. v.) browned by the action of an alkali, and is much used by draughtsmen and artists. India or China ink is of two kinds—(1) the dried pigment of the *S. officinalis*, or Mediterranean cuttle-fish, prepared chiefly in Italy and Turkey; (2) a mixture of fine lamp-black with glue or size and a little camphor, the genuine qualities of which are imported from Japan and China. Both of these kinds are used generally in Asia as writing inks, and both are practically indelible.

Sepoy (a corruption of *sipahi*, 'an archer,' the 'spahi' of Ottoman and Algerian armies), a word used to denote the native soldier, whether Hindu or Mahomedan, in the Indian army. For an interesting sketch of the early history of this army, see Sir John Kaye's *History of the Sepoy War* (vol. i.). In 1875, the native army in British India numbered 123,862 officers and men, of whom 63,000 belonged to the Bengal establishment, 34,000 to Madras, and 26,000 to Bombay.

Septaria are flattened calcareous nodules, which have been formed round some organic remain as nucleus in a clayey deposit, such as London clay or Kimmeridge clay. Formed, probably, when wet, the nodule has split from the centre outwards into radial fissures as it dried; and into these fissures carbonate of lime, sulphate of baryta, or a similar mineral, has subsequently found its way. Hence a transverse section of such a nodule presents a reticulated radial appearance. For this reason *S.* are sometimes cut and polished for ornamental purposes; but their chief use is to be ground down, after burning, into hydraulic lime.

September, the seventh month of the Roman calendar (hence its name) and the ninth of the Gregorian, has 30 days. On the 21st the sun enters Libra, and autumn begins (to the astronomer). This is also the date of the autumnal Equinox (q. v.). Michaelmas falls on the 29th of this month. Partridge-shooting begins on the 1st. In *S.* the English harvest is usually finished; hence the Old English name *harfest-mōnāth*, 'harvest-month.' Its other name, *hālig-mōnāth*, 'holy month,' was a survival from heathen times, *S.* being a month in which gifts were offered to the gods.

Septem'brists or **Septem'brisers** (Fr. *Septembriseurs*), a name applied to the perpetrators of the massacres in the Paris prisons, which lasted from 3 o'clock on Sunday the 2d September 1792 until the evening of the following Thursday, a hundred hours in all, with scarcely any intermission. They were caused by the frenzy into which the people were thrown by the successes of the invaders on the frontier and the insurrection in La Vendée, heightened by wild rumours of plots on the part of the aristocrats confined in the prisons to burst out, take the king from the Temple, and restore him to power. Matters were brought to a crisis by a premature rumour that Verdun had fallen into the hands of the Prussians. Thirty non-juring priests were being removed from the Hôtel de Ville to the prison of the Abbaye. At its gates the carriages conveying them were seized by the mob, and all, with the exception of one, were massacred. This was the beginning of the work of slaughter, which spread from the Abbaye to the Conciergerie, the Châtelet, the St. Firmin, La Force, the Salpêtrière, and Bicêtre, where the forgers of assignats were confined. In the courtyard of each a sort of tribunal was established, before which the prisoners were brought one by one. If, in the few minutes allowed for defence, they succeeded in freeing themselves from all suspicion of Royalism, they were dismissed with a cry of '*Vive la Nation!*' If, as was generally the case, they could not do so, they were thrust out at the gates, where a savage multitude was in waiting, armed with sabres, axes, and pikes to cut them down. The authorities made some feeble attempts to restrain the carnage. Roland protested, and Pétion harangued, but without more than momentary effect. Billaud-Varennes, on the other hand, encouraged the populace, promising a reward to every one who had 'worked' in the prisons, and the Hôtel de Ville registers showed that nearly £700 had actually been paid 'to workers employed in preserving the salubrity of the air in the prisons, and persons who presided over these dangerous operations.' The numbers massacred have been estimated by Royalist horror at from 6000 to 12,000, but the actual number, according to the lists drawn up by Advocate Maton, was 1089. Of all the victims, the most distinguished was the beautiful Princesse de Lamballe, the favourite of Marie Antoinette, who was

murdered with ghastly indignities. The hero of Thackeray's *Chronicle of the Drum* describes her death, telling how 'he drummed for a gallant procession that marched with her head on a pike.' It is still a disputed point whether the massacres are to be ascribed to the direct influence of Marat, but it is probable that they were rather a spontaneous outburst of popular frenzy, though that incomparable scoundrel doubtless approved and encouraged them. See the various authorities quoted in Carlyle's *French Revolution*, vol. 2, chap. iv., headed 'September in Paris.'

Septicæmia. See PYÆMIA.

Sep'timole, in music, seven notes grouped together to be played in the time of four or six according to the measure.

Septuagesima (Lat. 'seventieth') is the Sunday coming next after the last in Epiphany (q. v.), properly the sixty-third day before Easter. The name, like Sexagesima and Quinquagesima, the two following Sundays, is doubtless formed after the analogy of Quadragesima (q. v.).

Septu'agint (Lat. 'seventy'), the Greek translation of the Hebrew Scriptures, was so called either because it was approved and sanctioned by the Sanhedrim (q. v.), or because, according to tradition, seventy-two men were employed on the translation. The stories which have passed current regarding the origin of the *S.* are derived chiefly from a letter which professes to have been written by Aristeas, a Greek at the court of Ptolemy Philadelphus. This letter, however, the story of which was further embellished by Philo, Josephus, and the Christian Fathers, Justin Martyr, Irenæus, &c., is now believed to be a forgery written not long before the time of Christ. Still it probably indicates what was the tradition of the time regarding the origin of the *S.* Hence it is thought probable by scholars that the translation was actually begun under Ptolemy Philadelphus (B.C. 284-247), and pushed forward by Demetrius Phalereus, as the pseudo Aristeas represents, since this is confirmed by the independent testimony of Aristobulus, a Jewish philosopher in Egypt in the beginning of the 2d c. B.C. But Demetrius was keeper of the Alexandrian Library only under Ptolemy Lagos, having been removed by his son and successor, P. Philadelphus, and therefore it is supposed that it must have been in the last year of the reign of P. Lagos, during which it is known that he assumed his son into co-regency with him; i.e., B.C. 285-84.

Internal evidence does not confirm the story of Aristeas that the translation was made by Palestinian Jews, but rather indicates that it was made by Alexandrian Jews from a text of their own. This appears from the *S.* agreeing much more with the Samaritan than with the Hebrew Pentateuch, and from its showing a very intimate acquaintance with Egypt and Egyptian institutions. Moreover, scribes with an adequate knowledge both of Greek as well as Hebrew could not have been found at the time in Palestine, but only in Egypt. All that was translated at first was the Pentateuch. The other canonical books were also translated in Egypt, which appears to have been done before the time when the preface to Ecclesiasticus was written (B.C. 130). Several of the books—Jeremiah, Job, Proverbs—show important variations from the canonical Hebrew text. Esther and Daniel have important apocryphal additions; (E. Vulg. x. 4-xvi. 24; D. Vulg. iii. 24-90, xiii. xiv.). At first the *S.* was regarded by the Jews as an authentic and even inspired version of their Scriptures. But when, after the 1st c. A.D., controversies arose between them and the Christians, and the latter appealed to it, the Jews discovered that it differed from their own canonical Scriptures, and it gradually became odious to them. In the Christian Church it was held to be equally inspired with the Hebrew text; and up to the end of the 4th c. all the Latin translations of the Old Testament had been made from it. It was in order to place Christians on a level with the Jews that Origen undertook a comparison of the *S.* with the Hebrew text in his famous Hexapla (q. v.). The chief MSS. are the *Codex Alexandrinus* (British Museum), *Codex Vaticanus* (Rome), and *Codex Sinaiticus* (St. Petersburg), none of which are later than the 6th c. The best edition of the *S.* is that of Tischendorf (5th ed. Leip. 1875). See Frankel's *Historisch-Kritische Studien zu der S.* (Leip. 1841).

Sepulch'ral Mound. See BARROW and CAIRN.

Sequestra'tion is, in law, the setting aside from both parties to an action, or suit, the subject of controversy. It is also a

kind of execution for debt, in the case of a beneficed clergyman; the profits of the benefice being paid over to the debtor until his claim be satisfied. The profits of a benefice may also be sequestrated during a vacancy, and received by the churchwardens appointed by the bishop for the benefit of the next incumbent. S., in Scotch law, is the equivalent term to *Adjudication* (q. v.) in *Bankruptcy* (q. v.).

Se'quin (Ital. *zecchino*, from *secca*, 'a mint'), the name of a gold coin first struck at Venice towards the end of the 13th c. In size it resembled a ducat, and in value was equivalent to 9s. 4d. sterling. Florence, Genoa, the Papal States, and other places, issued similar coins.

Seraglio (Ital., a corrupt form of the Pers. *serâi*, 'a palace'), the palace of the Sultan, occupying a point of land between the Golden Horn and the Sea of Marmora, and forming the eastern portion of the city of Constantinople. It is surrounded by walls nearly 3 miles in circuit, and contains government buildings (divan, treasury, hall of justice, arsenal, mint, &c.), mosques, gardens, baths, as well as the Sultan's *harem* (Arab. 'sacred place'), which occupies its inner enclosure, and consists of a group of houses and gardens, each occupied by one of the Sultan's wives. The court of the harem is guarded by the black eunuchs, under their chief, the *kislar aga*. The gate of the outer court forms a sort of pavilion, from which the Turkish government takes its name of 'the Sublime Porte.' The S. was destroyed by fire in 1878. With the exception of the harem, the S. may be visited by strangers. It has accommodation for 20,000 persons, though it never contains that number.

Seraing', a thriving town of Belgium, province of Liège, on the right bank of the Maas, 6 miles S.W. of Liège by rail. It is connected by a suspension-bridge with Jemappes on the opposite side of the river. S. is famous for its extensive machine-factories and smelting-furnaces, established here in 1816 by an Englishman named John Cockerill, and which have belonged, since 1840, to a joint-stock company called *La John Cockerill Société*. They give employment to 9000 men, and produce annually 100 locomotives, 70 ships' engines, 1500 other engines, and cast-iron articles to the weight of 6000 tons. In 1877 this company did business to the amount of £1,378,000. Pop. (1877) 24,315.

Sera'jevo. See BOSNA-SERAI.

Serajunge (*Serajganj*), a town in the district of Pubna, Bengal, British India, on the right bank of the Brahmaputra river (or Jamuna as it is here called), 153 miles N.E. of Calcutta. Pop. (1872) 18,375. The houses are 6 miles from the low water channel of the river, separated by a sandy plain, and the river landing-places shift every flood-season. S. was founded about the beginning of the century, and is now the chief river-mart in Bengal, having risen with the growth of the jute trade. It collects jute, rice, oilseeds, tobacco, &c., from all the neighbouring districts for despatch to Calcutta, and distributes piece-goods, salt, sugar, iron, hardware, &c. The trade is entirely water-borne. The steamers of the E. Bengal Railway Company carry away about 50,000 tons of jute annually, and native boats nearly twice as much. The branch of the Bank of Bengal requires £400,000 a year in coin to adjust the balance of trade. There are as yet no jute presses, but the S. Jute Company employs 1200 hands in weaving gunny, or jute cloth for bags, which is exported to the value of £120,000 a year. In 1876-77 the total value of the export and import trade was more than 3½ millions sterling.

Serampore', a town in the district of Hoogly, Bengal, British India, on the right bank of the Hoogly river, opposite the cantonments of Barrackpore, 18 miles N. of Calcutta. Pop. (1872) 24,440. It was originally a Danish settlement, but was purchased by the British in 1845. The Baptist missionaries, Carey, Marshman, and Ward, established themselves here at the end of the last century. It is a peculiarly neat and clean town, and being now connected by rail with Calcutta (or rather with Howrah), is a favourite resort and country residence. It is well known as the place of issue for many years of *The Friend of India* newspaper, and for the manufacture of excellent paper.

Serape'um (Gr. *Serapeion*), the house, temple, or grave of Serapis (q. v.). Of these there were several. The two most famous were—(1) The splendid S. at Alexandria, which contained

the Alexandrian Library (q. v.), and which was destroyed by fire in 391 A.D. (2) The vast collection of temples to various gods at Memphis, which went under the general name of S., and which contained among other things the long subterranean galleries where the mummies of the sacred bulls had been deposited for more than 1000 years. They were brought to light by the excavations of M. Mariette in 1850, and many interesting relics are now in the Louvre. See Mariette's *S. de Memphis* (Par. 1856).

Seraphim, according to Isaiah vi. 2-6, were creatures with hands, feet, six wings, and a human voice. The traditional view, which originated with Dionysius the Areopagite (q. v.), is that they are an order of angels, being the chief of the nine choirs. With this corresponds the derivation of the name from *saraph*, 'to be high,' as if the S. were princes. But recent Assyrian discoveries have enabled us better to understand Oriental symbolism, and a little attention will satisfy any one that it is in the New Testament that angels are first represented as properly winged creatures. The wings in Isaiah were purely symbolical. The S. were God's messengers between heaven and earth. In short, the Cherubim (q. v.) and the S. originally symbolised, the former storm-clouds, which concealed the Deity, or winds, and the latter the lightning (cf. Ps. civ. 3, 4). Curiously it is *fire* from God's altar that one of the S. brings to Isaiah, fitting him thus to be a messenger for Jehovah. With this corresponds the derivation from *saraph*, to burn, making the S. 'the burning' or 'shining ones.'

Seraphine, a keyed musical instrument which preceded the harmonium. The sounds, which were unpleasant in tone, were produced by free reeds.

Sera'pis, or **Sara'pis**, the Greek name of a deity whose worship was introduced into Egypt from Sinope in the reign of Ptolemy I. His previous history is unknown. While some derive the name from *serpens*, which would point to an Aryan origin, Plew considers S. was a Babylonian deity. When the image reached Alexandria it was examined by Manetho, who identified the god with Osiris (q. v.) and Apis (q. v.) combined, and hence the name S. His worship soon spread throughout Egypt. He appears to have been a sort of Pluto, or god of Hades. Latterly his character changed, and he was sometimes identified with the sun-god. Still the worship of S. steadily extended in Asia Minor and Greece, his temples and images multiplied, and in 146 A.D. Antoninus Pius introduced the *cult* into Rome. Perhaps his popularity depended on the secret rites with which his worship was accompanied. These, however, were so licentious that the Roman Senate soon prohibited them. The worship of S. continued in Egypt, survived the establishment of Christianity, and the image of the god was not destroyed till 398 A.D. See Plutarch, *De Irid.*; Tacitus, *Hist.* iv. 82, *et seq.*; Wilkinson's *Manners and Customs of the Ancient Egyptians*, vol. iv.; Plew, *De Sarapide* (Konigsberg, 1868).

Seras'kier (Pers. *seri-asker*, 'leader of the army'), the Turkish title for all generals of high rank, but especially for the Minister of War. Hence the name *Seraskierate* for the War Office at Constantinople.

Serenade' (Ital. *serenata*), originally a piece of music performed in the open air at night when the weather is 'serene' (hence the name). It is often a song with the accompaniment of a guitar. Even yet, Spanish lovers salute their mistresses in this fine fashion. The term *serenata* is also applied to a pastoral composition partaking of the symphony form.

Seres (anc. *Siris*, or *Sirrhæ*; Mid. Ages, *Serrhæ*), a town of European Turkey, in the vilayet of Saloniki, on a tributary of the Strymon or Karassu, 45 miles N.E. of Saloniki, lies in a wide and fertile plain containing upwards of 300 villages, is the seat of a kaimakam and a Greek archbishop, and is the most important trading town in the interior of Macedonia. S. has a castle, numerous mosques, Greek churches, baths, benevolent institutions, manufactures woollen and cotton goods, gourd-shaped water-flasks, and exports cotton, rice, tobacco, and grain. Pop. 30,000.

Sereth', a tributary of the Lower Danube, rises in the Bukovina, on the N. slope of the plateau between the Carpathian Mountains and the Transylvanian highlands, flows first N. then E. through the Bukovina, and S.S.E. through Moldavia, finally reaching the Danube at Galatz after a course of 410 miles.

Serf. See SLAVERY.

Serge, a rough variety of twilled cloth made with hard spun worsted yarn.

Sergeants (from Lat. *serviens*), non-commissioned officers in the army above the rank of corporal. Their duties are to aid the commissioned officers in maintaining discipline and order, and in instructing the soldiers. Staff S. include the S. employed in various military departments, the serjeant-majors of regiments, quartermaster sergeant, sergeant instructors of musketry, armourer sergeants, &c. The other S. in regiments are called regimental sergeant. The sergeant-major is the highest non-commissioned officer in a regiment, and a colour-sergeant is the senior of the four S. which go to each company. The pay of a sergeant is from 2s. 1d. to 5s. 1½ per day.

Sergeants-at-Arms are legal functionaries whose duties are to attend the royal person, to arrest offenders of a certain rank, and to attend on the Lord High Steward of England during trials for treason. Two of them attend on the Houses of Parliament. They are in the old books called *Virgatiarii*, because they carried silver rods gilt with gold. In place of these they now carry maces.

Sergeanty, Grand, under the English feudal system, a tenure by which the tenant was bound to pay to his king some special honorary service in person, e.g., to bear his sword or banner, to act at the coronation as his champion or cup-bearer. By *Petty Sergeanty* the owner has to present the king with some such implement of war as a spear, dagger, &c. The former tenure was preserved by 12 Car. II., and the latter survives in the case of the estates of Blenheim and Strathfieldsaye, presented by the nation—their holders, the Dukes of Marlborough and Wellington, having yearly to give the king a small banner.

Sergijevskij Possad, a market-town in the Russian government of Moscow, 42 miles N.N.E. of the city of Moscow, is noted as the seat of the very rich Trinity monastery named *Troiaa Lavra*, whose possessions, before the abolition of serfdom, included 100,000 'souls,' for whom it received an enormous commutation. Pop. of S., with the surrounding district (*St. Petersb. Cal.*, 1878) 27,471.

Sergipe, a Brazilian province, included between the provinces of Bahia and Alagoas and the Atlantic. Area, 12,035 sq. miles; pop. (1872) 161,307. It consists of two regions, of which the eastern and smaller is low, moist, and fertile, and produces sugar, cotton, and tobacco; the western is mountainous, devoted to cattle-raising, and possessed of considerable mineral wealth. In the financial year 1875-76 the imports amounted to 35,297 reis, the exports to 1,483,419 reis. The capital is S. del Rei; pop. 9000.

Seringapatam (*Srirangapatna*), a town in the district and state of Mysore, India, at the W. or upper end of an island in the Cauvery, 75 miles S.W. of Bangalore and 10 N.E. of Mysore. Pop. (1871) 10,594. S. was the capital of Mysore from 1610 until 1811, when the troops were moved to Bangalore, on account of its unhealthiness. It had been most strongly fortified by Hyder Ali and Tippos Sultan, the latter of whom was killed when the town was captured by storm by General Harris in 1799. The fortifications are still standing, but the spot is now almost desolate. The inhabitants mostly live at the trading suburb of Ganjam. The whole island, 3 miles long by 1 broad, was ceded to the British, and is now leased to the State of Mysore for £5000 a year. The buildings include an ancient Hindu temple, a mosque, a summer palace, adorned with restored paintings representing the defeat of the British by Hyder in 1780, and a mausoleum where both Hyder and Tippos lie buried. A religious gathering or fair, held annually on the island, is attended by pilgrims from all parts of India.

Seringham (*Srirangam*), an island formed by the branching of the Cauvery river, almost opposite the town of Trichinopoly in S. India, about 80 miles in a direct line from the Coromandel or E. coast. It is 20 miles long by 2 wide at the broadest, and was an important military position during the wars against the Frenchman Duplex (1749-63). At its lower end is an *anicut* or weir, 1080 feet long and 40 broad, constructed for irrigation purposes by a Hindu prince 1600 years ago. In the same neighbourhood are the irrigation works of Sir A. Cotton. The town of S., at the upper end of the island, is beautifully situated

within four walls. Pop. (1871) 11,271. It is celebrated for a square pagoda, covering an area of 4 sq. miles, and composed of seven separate enclosures, which is the most frequented and wealthy shrine of Vishnu in S. India.

Serinuggur or **Srinagar**. See CASHMERE.

Serjeant-at-Law. Counsellors at the English bar are divided into barristers (see BARRISTER) and serjeants, the latter having precedence, but no other privilege. A S.-at-L. is created by patent from the crown.

Serous Membranes and **Serum**, a class of secreting membranes well represented by the *Pleura* (q. v.), *Peritoneum* (q. v.), *Pericardium* (q. v.) of man and the higher animals. The S. M. form shut or closed sacs, and thus consist each of two layers—one layer, the *visceral*, lying next the organs invested by the membrane; the other, or *parietal* layer, being the external or outer part of the membrane. Between these two layers a cavity is enclosed. The *endothelium*, a delicate lining of cells found on the inner surfaces of S. M., consists of a single layer of *polygonal* cells. These cells are flattened, and are developed from the *mesoblast*, or middle of the three layers of which the embryo at first consists. The endothelial cells are *nucleated*, and occasionally may develop *cilia*. In the peritoneum, certain of the endothelial cells exhibit small orifices or *stomata*, comparable in some respects to the openings of the same name found on the under surface of leaves. The stomata are the beginnings of *Lymphatic Vessels* (q. v.). S. M. may be divided into those which line visceral cavities (*pleura*, &c.), and those which line joints—the latter are *Synovial Membranes* (q. v.).

The S. M. secrete a fluid named *serum* which is almost identical with the *serum plasma* or fluid of the *Blood* (q. v.). Its colour is a pale yellow; and it coagulates on the application of heat. Chemical analysis shows serum to contain water and solids—the latter consisting of fibrin, albumen, extractives and inorganic salts.

Diseases of S. M.—In inflammation of a serous membrane, the fluid effused is not only greater in quantity than natural, but is also greatly altered in quality, containing a considerable quantity of albumen, sometimes a portion of fibrine; and, at other times, pure *liquor sanguinis* may be effused. In general, the serous membrane only shares in a dropsical condition common to other structures, as the areolar or cellular tissue. The more prominent diseases of the S. M. are described in the articles PERICARDITIS, PERITONITIS, and PLEURISY.

Serpent (Ital. *serpente*), a keyed wind-instrument made of wood, covered with leather, curved like a serpent, and fitted with a mouthpiece like a trombone. Its compass is from and from certain notes being more powerful than others it is difficult to play. The ophicleide is a more manageable instrument of the same kind.

Serpentaria. See ARISTOLOCHIA.

Serpent-Charming, an art practised in Eastern countries from remote ages, and mentioned both in the Old Testament and by classical writers. In Hindostan and Egypt serpent charmers are to this day largely employed to clear houses and gardens of ophidian vermin. They assert that they have a mastery over serpents due to certain constitutional peculiarities and to their use of spells, and in the exhibitions of their art they cause snakes to twine round their bodies, and to perform various movements to the sound of music. Professor Richard Owen has succeeded in proving this 'art' to be merely a rude jugglery by which trained serpents, supposed by onlookers to be discovered and charmed in their presence by the conjuror, are produced by sleight of hand from concealment about his own person. See an article by Professor Owen in *Blackwood* for February 1872.

Serpentine, or **Ophite**, a silicate of magnesia, forming immense rock-masses in various parts of the world, and also frequently occurring in beds and veins. Its composition is represented by the formula $2(\text{MgO}, \text{SiO}_2) + (\text{MgO}, 2\text{H}_2\text{O})$; its hardness is about 3 and its specific gravity varies from 2.5 to 2.6. In colour it may vary from a uniform green or grey to a dark brownish-red, and it is often beautifully veined, striped, or mottled. It is a disputed point whether S. results from the alteration of a volcanic rock, or is due to metamorphic action upon a magnesian limestone. S., though soft enough to be

easily cut or turned, yet admits of a high polish, and is much used for the manufacture of various ornamental articles. The best specimens are obtained at the Lizard Point in Cornwall, and at Portsoy in Banff. Among the varieties of *S.* may be mentioned *noble S.* of a translucent green colour, *marmolite* or foliated *S.*, and *pirolite* or fibrous *S.*

Serpents (*Ophidia*), an order of *Reptilia* (q. v.), characterised by the absence of limbs, the development of scales as an exoskeleton, the want of a sternum or breastbone, the movable nature of the *os quadratum* or *quadrate bone*, and the union through ligament alone of halves of the lower jaw. There is no ossification of the *dermis* as in *Crocodylia*. The length of the body is a marked feature of *S.* The number of vertebrae varies greatly, more than 400 occurring in some of the great pythons. No *sacrum* exists, and there is no distinction between or division of the spine into cervical, dorsal, and lumbar vertebrae. A notable feature is the large number of ribs; almost all the vertebrae, with the exception of the atlas or first, bearing these. The ribs articulate with the transverse processes of the vertebrae, and are not attached inferiorly to any breastbone, but are imbedded in cartilages which are in turn connected with the great scales or *scuta* that cover the ventral surface of the body. The premaxillae are represented usually by a single small bone, which rarely has teeth, and is joined to the maxillae by fibrous tissue only. The floor of the skull is flat, while in front it diminishes greatly in height. The *hyoid* is very rudimentary, and is represented by two cartilaginous filaments, unconnected in any way with the skull. In the pythons a pair of rudimentary hind limbs exists, and traces of a pelvis are also found. Locomotion is effected by the muscular contractions of the body, the animals moving literally on the ends of their ribs. Teeth are borne by the premaxillary bones, by the maxillaries, palatine, and pterygoid bones, and by the dentary part of the mandible. One of the most singular developments of teeth in *S.*, and indeed in the entire animal kingdom, occurs in a little African snake—*Rachiodon*. In this snake, the ordinary teeth are very small, but the lower or inferior spines of some eight or nine vertebrae of the neck are long, and their enamelled tips project into the interior of the gullet, so that when the snake swallows an egg, the brittle morsel passes entire into the gullet, and is broken only when fairly on its way to the stomach. The teeth of *S.* are not implanted in sockets, but become ossified to the surfaces of the bones which bear them. They are replaced when worn away or injured by new teeth developed at the bases of the former ones. The most interesting modification of the teeth of *S.*, however, is in the development of certain of these organs to form the well-known *poison-fangs*. In the typically poisonous serpent (e.g., the rattlesnake) the upper jaw bears two largely developed teeth termed *fangs*. Each fang has a very deep groove running down its anterior aspect, and the margins of this groove are opposed so as to convert it into a canal—hence the fangs are said to be *canaliculated*. This canal opens by a wide aperture above into the poison-gland, so that by the compression, muscular and friable, of the gland, the poison flows down the canal and is ejected, through the lower minute aperture, into the wound made by the fang. The *poison-gland* itself is merely an extraordinary development of one of the *salivary* or *buccal* glands. It does not exist in all *S.*, and when developed lies in front of and below the eye. The poison of different *S.* varies in intensity and virulence, but appears to take effect on the blood. One theory is that snake-poison acts by preventing oxygenation of the red blood-corpuscles. No specific remedy is yet known for snake-bite. The most effective treatment is at once to tie a ligature tightly round the limb, above the wound, and to excise the part freely, and then to suck the blood repeatedly, and cauterise the parts deeply before removing the ligature. If a finger be the seat of a bite, it should be cut off at once. In sucking a poisoned wound, the danger consists in there being a crack or wound in the mouth by which the poison may be absorbed. In cases of serpent bites Professor Halford recommends the injection of ammonia into one of the large veins as near the bite as possible. Professor Fayer, however, states that in wounds produced by *S.* bites in India, when these wounds fairly penetrate the skin, the injection of ammonia into the veins rather hastens death than otherwise, and he regards the plan as positively hurtful. In 1876, 19,432 persons were killed by snakes in India, and 61,229 cattle.

The digestive system of *S.* presents nothing worthy of special remark, save that the intestine ends in a *cloaca* opening transversely. There is no urinary bladder, and the heart (as in all reptilia save the *Crocodylia*) is three-chambered. The lungs are long and cellular, but, as a rule, only one is fully developed. The tongue is bifid at its tip, and is remarkably extensible. The eye exhibits certain notable peculiarities. No true eyelids are developed, and hence the peculiar stony gaze of these reptiles; but the eye is surrounded by scales, attached to which is the transparent *antocular membrane* regarded by some authorities as the united and modified eyelids. Inside the *antocular membrane* a double fold of the *conjunctiva* of the eye is found; and the membrane is periodically shed or cast off with the serpent's skin, the animal being blind until the membrane is renewed. The pupil of the eye is round, but may be vertical, as in the boas and venomous *S.*

S. have been variously classified. In Dr. Gray's arrangement, they are divided into the *Viperine* and *Colubrine* snakes. The former are known by the absence of true teeth in the upper jaw, and by the invariable presence of two canaliculated fangs. In the *Colubrina* there are solid teeth, with or without fangs. The *Viperina* include the Rattlesnakes (*Crotalidae*) and Vipers (*Viperidae*). The *Colubrina* are divided into the (1) *Venosa* (e.g., cobra, *Hydrophida*, &c.), in which solid teeth lie behind the fangs; (2) *Suspecta*, in which solid teeth lie in front of the fangs; and (3) *Innocua* (*Boa*, *Python*, *Coluber*, &c.), in which fangs are wanting, and solid teeth are found only in the upper jaw. The head in *Viperine S.* is broad and triangular, and a distinct neck appears, whilst in the *Colubrine* the head gradually tapers off into the neck. *Fossil S.* are of relatively recent occurrence. The oldest occur in the London clay, where the *Palaeophis stolicus* is found, and no member of the group is older than the Tertiary period.

Serpents, Fascination by, a kind of mesmeric influence exercised by the rattlesnake, tree-snake, and other reptiles over their prey. Birds, squirrels, even antelopes, unable to resist the fascinator's glance, make no attempt at flight, or will absolutely draw nearer to the serpent's fangs, unless aroused by some sudden cry, or by the intervention of an obstacle. See Ellis, *Three Visits to Madagascar* (Lond. 1858).

Serpukov, a town of Russia, government of Moscow, on the Nara, a feeder of the Oka, 57½ miles S.S.W. of Moscow by rail. It is now the second town in the government, and has large linen and hemp-weaving, tanning, silk-spinning, and tile-making, besides important trade in corn, fish, wood, and cattle. Pop. (St. Petersburg. Cal. for 1878) 16,720.

Serpula, a genus of *Tubicola* (q. v.), or tube-dwelling worms, forming a hard white limy shell, common on rocks and stones at low water-mark. The familiar species is *S. contortuplicata*, the tubes of which are often wonderfully convoluted. From the mouth of the tubes the head of the worm protrudes, furnished with gills and tentacles of a bright red colour. One of the tentacles is conically shaped, so as to close the mouth when the animal has withdrawn into its shell.

Serra'no y Domini'quez, Francis'co, Duque de la Torre, a marshal and statesman of Spain, was born at San Fernando, near Cadiz, November 10, 1810. Entering the army in 1825, he rose rapidly, becoming a general of division before he was thirty. He began his political career in 1841 as a deputy in the Cortes for Malaga. In 1843 he joined Narvaez in effecting the overthrow of Espartero. In 1845 he became a senator, and soon obtained a marked influence over Queen Isabella. In 1847, on the accession of Narvaez to power, he was sent to Granada as Captain-General. He now turned liberal, was banished in 1854 for participation in the insurrection at Saragossa, but returned the same year as a supporter of Espartero and O'Donnell. In the subsequent rupture between these two he sided with the latter. In 1857 he went as ambassador to Paris; and as Captain-General of Cuba in 1860-62 reannexed St. Domingo to Spain, an act which secured him a dukedom. In 1866 he was president of the senate, and strongly opposed Narvaez for the illegal prorogation of the Cortes. At the revolution of September 1868 he joined Prim and Topete, and shortly after became president of the council of ministers at Madrid, and commander-in-chief of the army. On June 16, 1869, he was elected Regent by a large majority; and this

post he held till Prince Amadeo of Italy was prevailed upon to accept the crown (January 2, 1871). S. then became Premier, but resigned in July of the same year; and in April of 1872 he entered the field against the Carlists, with whom he concluded the convention of Amorevieta. On the abdication of King Amadeo, and the proclamation of a republic in February 1873, S. fled to France, but soon returned, and after the *coup d'état* of General Pavia in January 1874, became chief of the executive. He again entered the field against the Carlists, compelling them to abandon their trenches before Bilbao on May 1. In December he once more took command of the Army of the North; but withdrew to Biarritz on the proclamation of Alfonso XII. as king by Martinez Campos (December 28, 1874). He returned to Madrid, however, in the course of a month; but has not since taken any active share in the administration of Spain.

Serto'rius, a Roman general, born at Nursia in the Sabine country, in the 2d c. B.C. He fought first in Gaul, distinguishing himself at the battles of the Rhone (105 B.C.) and of Aquæ Sextiæ (102 B.C.). In 97 he was a tribune of the soldiers in Spain, and in 91 he returned to Gaul as quaestor. Although no admirer of Marius, he opposed on principle the aristocratic policy of Sulla, and gave an active support to the Marian party. After Sulla had gone to the East to fight Mithridates, Cinna attempted to rally the routed Marians, and called S. to his side. He answered the call, entered the city with Marius and Cinna, but had no part in the hideous butcheries that followed. He was for a time powerless to stop the torrents of blood that deluged Rome, but after the death of Marius 'he called together the Marian bandits, under pretext of giving them their pay, surrounded them with his trusty Celtic troops, and caused them to be cut down *en masse*' (Mommson). The return of Sulla, and the crushing defeat in Italy of the popular party compelled S. to carry the war elsewhere. In 82 he left for Spain. Here he attempted to form a new state with the advantages of Rome, but without the personal and racial favouritism which was ruining her. His first efforts had no success. Unable to resist the forces of Sulla, he embarked at New Carthage, and sailed about for some time, half determining to withdraw to the Canary Islands, and live 'free from tyranny and ceaseless wars.' However, after some adventures in Mauritania, he returned to Spain, and soon gathered a powerful army. He won the hearts of the native Spaniards and of the *hybrida* or children of Romans by Spanish wives. Metellus Pius, who was sent against him in 79, was quite unable to do anything. Spain seemed permanently cut off from Rome, and S. the creator of a new state. For the children of Spaniards of quality an academy was erected at Osca (Huesca), in which they received the higher instruction usual in Rome, learned to speak Latin and Greek and to wear the toga. It was the first genuine effort to Romanise a province by assimilation instead of extirpation. In 77 Pompey was despatched with reinforcements. A great battle was fought on the Sucro (Xucar) in 75, but was indecisive, and S. would probably have continued more than a match for open foes. But dissensions arose in his own camp. Many of his officers were proscribed Marians, who, though siding with him politically, were strangers to his pure motives, and filled his camp with petty bickerings. Perpenna especially, a Roman of high birth, desired the chief power. S., meanwhile, had been getting more suspicious, the fickle Spaniards had been wavering, the conspirators took courage and assassinated him at a banquet in 72. 'So ended,' says Mommson, 'one of the greatest men, if not the very greatest man, that Rome had hitherto produced—a man who, under more fortunate circumstances, would perhaps have become the regenerator of his country—by the treason of the wretched band of emigrants whom he was condemned to lead against his native land. History loves not the Coriolani; nor has she made any exception even in the case of this the most magnanimous, most gifted, most deserving to be regretted of them all.'

Sertularia, or **Sea-Fir**, a well-known genus of Zoophytes (q. v.) or *Hydrozoa*, in which the little *polypites* or individual animals are contained within horny cups or *hydrotheca*. The name 'sea-firs' is given to the S. from the fact that in outward appearance, and as they grow rooted to stones and shells, they exactly mimic the aspect of miniature fir-trees. The S. are typical of the order *Sertularida*; and *S. fusca*, *S. cupressina*, and *S. or Diphasia pinnata* are common species.

Ser'm. See BLOOD.

Ser'val (*Leopardus serval*), a species of Felidae or cats, allied to the Leopard (q. v.), and found in S. Africa, Abyssinia, Algeria, and Senegambia. It is also named the 'tiger-cat,' and 'bush-cat.' The fur is of a yellow colour, with black spots, the under parts being white. The tail is thick and somewhat bushy. The average length is 2½ or 3 feet. The S. is easily tamed.

Serv'ant. See MASTER AND SERVANT, APPRENTICE.

Serveto-y-Reves, Miguel, better known by the Latin form of his name, **Michael Servetus**, was born at Tudela, in Navarre, probably in 1511, of an honourable family from Villanova, in Aragon. He was sent to Toulouse to study law, but was fonder of theology and astrology. The result of his studies was that he became sceptical both of the Roman Catholic and the Protestant theology, being especially dissatisfied with the doctrine of the Trinity. Accordingly he published (Basel 1531) *De Trinitatis Erroribus, Libri Septem*, with its sequel, *Dialogorum de Trinitate, Libri Duo* (Hagenau 1532), and wrote a number of letters on the subject to Calvin, who had been a fellow-student with him at Paris. After this he studied medicine at Paris, and finally settled at Vienne in the practice of that profession. After a period of about twenty years, during which he outwardly conformed to the Romish Church, he printed secretly his *Christianismi Restitutio* at Vienne (1553), in which he promulgated certain Pantheistic theories, and declared that the two grand hindrances to the spread of Christianity were the doctrines of the Trinity and of Infant Baptism. S. had sent a copy of this work to Calvin at Geneva, and through Trie, a French refugee there, who obtained documentary evidence from Calvin, it became known that he was the author of it. He was arrested and was to have been tried by the archbishop's court, but having made his escape, he was only burned in effigy. He fled to Geneva, relying, it is supposed, on the support of the Libertine party, which was defying Calvin at the time. As soon as the latter knew of his presence in the city, he caused his arrest. He was tried before the Senate, a scribe of Calvin's making the accusation, and Calvin and the other preachers controverting his opinions, and having been condemned, he was burned, October 27, 1553. See Rilliet, *Relation du Procès Crim. contre M. Servet, &c.* (Gen. 1844); Tollin, *Charakterbild Michael Servet's* (Berl. 1876), and *Lehrsystem Michael Servet's* (2 vols. 1878); Willis, *Life of S.* (Lond. 1877).

Ser'via, an independent principality of the Balkan peninsula, in shape resembles a rude triangle, with the Save and Danube dividing it from Hungary for its base, and the sides partially defined by the Drina on the W. severing it from Bosnia, and the Danube and Timok on the E. parting it from Rumania and Bulgaria. The new south-western and south-eastern frontier, fixed by the Berlin Congress (July 1878), starting from Kopanion near Novi Bazar, runs in a S.E. direction past Mitrovitza and Pristina to Vranja, there bends N.E. towards Pirot, and finally with a N.W. course follows the crest of the Balkans till it joins the original frontier a little to the E. of Nissa. Area, including the 4236 sq. miles of annexed Bulgarian territory, 18,816 sq. miles; pop., with the 264,000 inhabitants of that territory, 1,642,068. Valley plains, shut in by amphitheatres of hills, form the most frequent geographical configuration, but the Matschwa Plain in the N.W. is the only one of any considerable extent, and none of the hills exceed 3300 feet in height, though their detached cones often present a wilder aspect than many loftier but more connected ranges. The Servian Morava, rising in the W., and Bulgarian Morava, in the S., unite to form the Great Morava, which, flowing northwards, enters the Danube near Semendria, and divides the country into two unequal portions. Of these, the western and larger one is watered by the Dobratsha and Kolubara, affluents of the Save; the eastern by the Pek, Milawa, and Timok, tributaries of the Danube. The natural capabilities of S. have hitherto been turned to scant account, nearly eight-ninths of the entire area lying uncultivated, and but one eighteenth being under crops, one-sixteenth in pasture. The vast primeval forests of oak, beech, ash, and birch have often been recklessly wasted, as a peasant fells a tree for the most trivial purposes; so that where in 1835 the author of *Eothen* found a forest stretching for more than 100 miles, timber has now become an absolute scarcity. So rich, however, is the soil, that S. produces

grain beyond its own requirements, and in 1872 the value of wheat exported reached £37,690, of other cereals £7807. Each cottage has its plum orchard, and from the fruit a mild alcohol (*slivovitsa*) is distilled, the export of which amounted to £29,300; while vineyards yield an inferior native wine. The breeding, however, of stock, especially pigs, is the great national industry. In 1872 there were exported 472,700 swine, 42,355 cattle, 53,620 sheep, and 14,862 goats, with a value of £865,811, besides skins (£144,984), tallow, wool, and butter (£51,905), animal produce thus making up £1,062,700 out of the total value (£1,234,805) of exports, which further included dried prunes (£50,371) and gall-nuts (£26,495). In 1875 the exports included 1,915,730 qrs. of cereals, 367,439 pigs, 24,519 cattle, and 1,103,726 sheep and goat skins; while amongst the imports (£1,298,255 in 1874) are flour, horses, tobacco, dried fish, and colonial goods. Minerals also are imported, for though S. has no lack of coal, copper, and iron beneath its surface, no mines were worked till 1873, and then by two English companies. Beyond some trifling cotton, woollen, leather, and tobacco industries, S. has no manufactures, the Moslem Servians having taken with them their skill as armourers and general craftsmen when they withdrew with the Turkish garrisons. In 1874 there were 51 post-offices and 884 miles of telegraph lines, but S. suffers greatly from having no railways and few good roads, though its communication with the outer world has been so far improved that in 1874 a line was opened from Salonica to Mitrovitz, near the southern frontier, and another in June 1878 from Temesvar to Orsova, on the Hungarian bank of the Danube.

Races, Religions, and Education.—In the total pop. (1866) of 1,216,346 persons there were 127,545 Rumanians, 24,637 Gypsies, 2589 Germans, and 3256 other foreigners. The state Church is the Orthodox Greek, acknowledging the primacy of the Patriarch of Constantinople, and governed by one archbishop and three suffragan bishops, and there were in 1866 but 3409 Roman Catholics, 352 Protestants, 1560 Spanish-speaking Jews, and 4963 Mohammedans, but by the recent annexation the number of the last must now amount to some 80,000. Toleration and religious equality are stipulated in Article 35 of the Berlin Treaty. Education is well provided for, and in 1874 there were 517 public schools with 650 teachers and 23,278 pupils, and 16 higher schools with 112 teachers and 1759 pupils; while Belgrade University had 19 professors and 207 students.

Army, Constitution, and Revenue.—The standing army, of 150 officers and 4072 privates, comprises four battalions of infantry, two squadrons of cavalry, three regiments of artillery, &c.; the militia is divided into two bans, the first of which (98,990 men in 1875) has three weeks' yearly drill, while the second (51,600 men) is only called out in case of invasion. All Servians between twenty and fifty must join the militia after two years spent in the standing army. The cavalry is the weakest, the artillery the strongest branch of the service, the latter in the late war comprising fifty batteries, each of six rifled guns, well manned and officered. S. is essentially a territorial democracy. After the Knes or Prince comes the Senate, composed of 17 life members nominated by him; but no laws can be made or taxes imposed without the sanction of the Skuptchina or Parliament, which, meeting once in three years, is composed of 134 deputies—33 of the Prince's nomination and 101 elected by the universal manhood suffrage of the nation. An extraordinary Skuptchina, four times larger than the ordinary Parliament, may also be legally convoked to elect or depose a prince, so that S. has strong guarantees for its national liberties. The principality is divided into 18 departments (each governed by a *Natchalnik* or prefect), 60 sub-departments, and 1049 communes, which last present a curious survival of the ancient village community. The total public revenue of the year 1875-76 was given in the budget estimates at £705,134, the expenditure at £696,137. No public debt existed prior to 1876, when the war demanded a small internal loan, and a foreign one of £1,000,000, contracted in Paris under Russian guarantees in July 1877. Belgrade, the capital, had a pop. in 1874 of 27,603, and there were fifty other places with more than 2000 inhabitants.

History.—About 620 A.D., in the reign of Heraclius, the Servians entered the Balkan peninsula from beyond the Carpathians, not on Heraclius' invitation to aid him against the Avars, but as allies of that formidable Tartar race. Nor until 678, when they had embraced Christianity, did they acknowledge the Byzantine

suzerainty, and even then their connection with the empire was of the slenderest. From an aggregation of independent clans, Néménia, Grand Zupan of S. (1162), welded a nation, and founded a dynasty whose daughters wedded the royal houses of East and West. Out of it sprang Stefan Nemanja, first king of S. (1222), and Stefan Dushan, 'Emperor of all Serbs and Greeks' (1336), whose realm, stretching from sea to sea, included Slavonia, Dalmatia, Albania, Macedonia, and Bulgaria. On the march to Constantinople, to offer himself as candidate for the vacant imperial throne, he died at Devoli (1355), and dying, wept 'to see the gate stand open by which the enemy should enter in.' The Moslem foe did enter; the field of Kossovo (1389) cost the lives of both Amurath the Ottoman and Lazar the Serbian czar; but Amurath's successor, Bajazet, beguiled young Stefan, Lazar's son, and S. became first tributary, then wholly subject, to the Porte, its nobles adopting their conquerors' faith, or taking refuge in Christian countries. Four hundred years the land had lain in darkness, broken only by the heroic defence of Belgrade and the passing successes of Prince Eugene (1717-39), when at last, the ten years' insurrection (1804-13) of Czerny (q. v.) having ended in failure, Milosch (q. v.) took up the desperate game, tore from the Turks a fragment of their conquests, and formed therefrom a state, tributary indeed, but with a native Knes, Skuptchina, and Church. Bred in a Turkish school, he ruled like a Turkish pasha, and was banished but recalled, as also was his son and successor Michel. The latter's reign witnessed the wanton bombardment of Belgrade (1862) and consequent withdrawal of the Turkish garrison (1867); he organised and armed the Servian militia, establishing an arsenal at Kragevatz; and his assassination by Karageorgevitch conspirators (May 29, 1868) was a grievous check to the growth of the principality. The new constitution granted by Milan (q. v.) in 1869 stirred hopes—which Russian emissaries took care to fan—of a great Servian kingdom on the Danube. With the Herzegovinian rising (1875) the Omladina, a part political, part literary brotherhood, renewed its talk of union of the Slavonic provinces under Austrian or Russian supremacy, and on June 30, 1876, war was proclaimed with Turkey, 'to free the Slavonic Christians from their bondage.' But, for all their good opening on the Drina, in spite of the Russian volunteers who flocked to their standard, though Tcherniaeff proclaimed Prince Milan king, the Servians soon found themselves beaten at every point, and were glad to accept first a truce (November 1, 1876) and next a peace (March 6, 1877), restoring the *status quo* before the war. Within nine months Russia itself had marched on Turkey. 'God's will' declared itself that S. should anew defend the 'Holy Cause,' so on December 15, 1877, the Servian troops, 140,000 strong, re-crossed the frontier. Once more the 'Holy Cause' gained little from Servian arms, but S. from the Berlin Congress gained independence. See Ranke's *Serbische Revolution* (2d ed. Berl. 1844; Eng. trans. Lond. 1853); Denton's *S. and the Servians* (Lond. 1862); Forsyth's *Slavonic Provinces* (Lond. 1876); Reinach's *La Serbie et le Monténégro* (Par. 1876); Lindenmayer's *Serbien* (Vien. 1876); Mackenzie and Irby's *Slavonic Provinces of Turkey* (2 vols. Lond. 1877); and Gambier's *S.* (Lond. 1878).

Language and Literature.—Servian, or (to adopt the generic term) Illyrian, forms with Russian and Bulgarian the S.E. Slavonic branch of the Wendic family of languages, and is spoken over a far wider area than Servia proper, falling according to Vuk Stephanovic into three main dialects—the first that of Herzegovina, Bosnia, Montenegro, Dalmatia, Croatia, and Upper Servia; the second, of the Resava, Upper Morava, and Tsrna Rjeka districts; the third, of Syrmia, Slavonia, and Servia between the Save, Danube, and Morava. Again, the Illyrian race is divided politically into independent states and subjects of Austria, as theologically into Orthodox Greeks and Roman Catholics, the latter of whom employ the Latin, the former the Cyrillic alphabet. The melodious character of Servian, due to the predominance of vowel endings, bears witness to Greek and Italian influences, nor are traces of the Turkish domination wanting in the spoken tongue, which, thanks to the efforts of Dositei Obradovic (1739-1811) and Vuk Stephanovic Karadzic (1787-1864), has now superseded Old Slavonic as the literary dialect. Vuk was the first to publish a good Servian Grammar (1814; Ger. trans. with introduction by J. Grimm, Berl. 1824) and Dictionary (1819;

2d ed. 1852). See Miklosich, *Vergleichende Grammatik der Slavischen Sprachen* (4 vols. Vien. 1852-76).

Servian literature falls into three periods, the first extending from the earliest time to the extinction of Servian nationality by the battle of Kosovo (1389), the second from 1389 to the revival of letters in the 18th c., and the third from 1750 to our own day. To the first belong the chronicle in verse of Pop Dukljanin (circa 1162), which consists of over 1100 lines, and has been edited by Sakcinski (Agram, 1851); a Life of St. Simeon, and Domitian's *History of St. Simeon and Sabbas* (1264); the *Rodoslov* (ed. by Danicic, Agr. 1866), or Lives of Servian Czars and Archbishops, compiled by Archbishop Daniel (died 1338); and the famous code of laws of Czar Stefan Dushan (1336-56). With Servian freedom died also the Servian written literature, but to the four centuries of Turkish domination belong the unrhymed trochaic ballads, familiar to English readers through Sir John Bowring's translations (Lond. 1827), and first collected by the Franciscan Miosic (Ven. 1756). Whether handling the fiery cycles of Knes Lazar and the legendary Kralevic, or simple idylls and pastorals, these nameless outpourings of a down-trodden race rank high above the so-called Ragusan Classics—the erotics of Lucic (1480-1521), the *Fezjupka* of Cubranovic (1500-59), or even Gundulic's *Osman* (1621). Nor have they yet been matched by any of the productions of the modern school of Servian poets, Musici (died 1837), Milutinovic, Jovanovic, &c. Their epics, lyrics, and dramas, if often graceful, are always imitative, based upon German models; and the only works of abiding interest beyond the petty Servian world are the patriotic history of Raic (1726-1801), and the linguistic and antiquarian writings of Obradovic and Karadshic. A collection of Servian national songs from Herzegovina has been published by Karadshic's widow (Vienna, 1866) and from Bosnia by Petranovic (Serajevo, 1867); a South Slavonic Anthology by Krizek (Prague, 1863), and an Anthology of Servian and Croatian poetry by A. Senoa (Agram, 1876). See 'The Literature of the Servians and Croats,' in the *Westminster Review* (April 1878).

Service is the name given to *Pyrus* (*Sorbus domestica*), a tree native of S. Europe and W. Asia. It has pinnate leaves resembling those of the Rowan (q. v.), but the 'pome' is considerably larger, and when ripe (in October) of a rusty brown tinged with yellow and red. Like that of its ally, the Medlar (q. v.), this fruit is eaten in a state of incipient decay, but the tree is rarely planted in England, and is now, for fruit yield, neglected on the Continent. The wood, however, is hard and heavy, and is much esteemed by millwrights for rollers, screws for wine-presses, &c. The 'wild S.,' or *P. torminalis*, which has ovate leaves with triangular lobes, is a small tree locally indigenous in England, extending through Europe to N. Africa. Its small greenish-brown dotted fruit occasionally comes to market, but is not much appreciated, and is only serviceable when half-rotten. See PYRUS and ROSACEÆ.

Service of an Heir. The legal procedure of Scotch law by which an heir completes his title to an estate of land is so termed.

Servitude is a term of Roman law imported into that of Scotland denoting a right possessed by some one over a subject belonging to another. The analogous term of English law is Easement (q. v.). Servitudes are *predial* or *personal*. The former are subdivided into *urban* and *rural*. The *urban* is the right which the owner of one subject has in virtue of his ownership over the subject of another. For example, see LIGHT, *Law Regarding*. The *rural* S. is over land or water. Example, see FEAL AND DIVOT. Personal servitudes are the various kinds of *usufruct*, or *Liferent* (q. v.). See also COURTESY, TERCE.

Servius Tullius, in Roman legend, was the sixth king of ancient Rome. Prodigious which happened before his birth and afterwards were interpreted by the Etruscan queen, Tanquil as having an important bearing on the fortunes of the royal house. By her aid he secured the throne on the death of Tarquinus, and ruled peacefully from 578-534 B.C. The chief work which the legend ascribes to S. T. is the creation of the *Comitia Centuriata*. It was originally a purely military reform. As it imposed duties rather than conferred rights, it was probably not a change demanded by the plebeians. The Roman territory was divided into thirty tribes, and the people into five *classes* ('summonings'), according to wealth. These classes were fur-

ther subdivided into centuries. Eighteen centuries of the first class formed the *Equites* or cavalry; half the remainder (forty-two centuries), along with half of each other class, formed *Pedites* or infantry of various kinds, differing in equipment. The other half in each class consisted of men above forty-six years of age—the limit of military service. Mommsen is strongly of opinion that the so-called Servian institution did not acquire a *political* character till a later period. He urges that the regulation 'by which every one who had passed his sixtieth year was excluded from the centuries, becomes absolutely absurd, if they were intended from the first to form a representation of the burgh community similar to and parallel with the curies.'

Sesamoid Bones, the name given to certain rounded bodies, at first cartilaginous and then bony, found in the tendons of muscles. The *Patella* (q. v.) or knee-cap is a sesamoid bone. Another is developed in the upper joint of the thumb, and at the corresponding joint of the great toe. S. B. are said to occur most frequently in males, and in persons of robust and muscular build.

Sesamum, a genus of annual herbs belonging to the order *Sesamaceæ* or *Pedaliaceæ*, of which *S. Indicum*—a native of S. Asia extending to Japan—has with several varieties been long cultivated in India, Africa, &c., even as far N. as 42°, chiefly for the sake of its seeds. These yield half their weight of a fixed oil, in colour resembling almond oil, but possessed of drying properties. It is from the black-seeded variety of the plant that the principal supply is obtained. In India S. oil is the basis of all those used in perfumery; it is also a good substitute as a table oil for that of the olive, and the finer qualities of it are used to adulterate almond oil. The soot obtained by burning it is an ingredient of China-ink. Both the seed and the oil are extensively imported into Europe, appearing in commerce under the name of Teel or Sesame seed, and Gingelly oil. In Greece, Egypt, and other Oriental countries, the seeds are used in confections, and in the United States the leaves—which contain a quantity of mucilage—serve to make a demulcent drink for catarrh, &c.

Sesosthis, the Greek name of the conqueror **Rameses II.**, the third king of the 19th Egyptian dynasty, called 'the Great,' to distinguish him from Rameses, the first king of the same dynasty. S. was called by Diodorus *Sesostris*, and it appears from Manetho that he was also named *Sethosis*. This, Bunsen maintains, should be read, as in Pliny, *Se-sothis*, i.e., 'Son of Sothis,' or Seti, whose actions are also attributed to S. See Herod. ii. 102-111; Bunsen, *Ægyptens Stelle in der Weltgeschichte* (5 vols. Gotha, 1844-45); Brugsch, *Histoire de l'Égypte* (vol. i. Leips. 1859).

Sesquialtera, an organ-stop sounding high harmonics to strengthen the ground tones. It is composed of several ranks of pipes.

Sessa (the ancient *Suessa Aurunca*), a town of S. Italy, province of Caserta, situated on the crater of an extinct volcano, on the road from Gaeta to Capua, 16 miles N.W. of the latter. It contains the ruins of an amphitheatre, and ancient medals and bronzes have been found. Pop. (1877) 21,443.

Session, Court of. See COURT OF SESSION.

Sessions, Special, or Quarter, are meetings held by Justices of the Peace for an especial purpose, by notice specifying the time, place, and object of the meeting. To make valid an order made by a S. S., reasonable notice must be given to each magistrate entitled to be present.

Sestertius, an ancient Roman coin, either of bronze or silver, and equal to one-fourth of a Denarius (q. v.). It originally was worth two and a half *asses* (see AS), hence the name (*semitertius*, two and a half); but when the denarius was made equivalent to sixteen asses, the S. was correspondingly modified, so that it was worth four asses. After the time of Augustus, the S. was worth nearly twopenny sterling; but with the decline of the Empire its value diminished. The *sestertium* (= 1000 sestertii) was a money of account, but not a 'coin.'

Sestri Ponente, a seaport of N. Italy, province of Genoa, 5 miles S.E. of that city by rail. Near it is Mont Gazzo, which supplies a celebrated yellow alabaster. The town contains many superb villas, as it is a favourite summer resort of the Genoese. S. has 16 silk factories, a large machine factory, and considerable shipbuilding. Pop. (1874) 9488.

Seta'ria. See MILLET.

Seth'ites were one of the minor Gnostic (q. v.) sects of the 2d c., who, like the Cainites, held the idea that in the Demiurge's world the Sophia ever preserved a spiritual seed, of whom Seth was the great representative, as was Cain, according to the latter.

Set'ons are made by pinching up a large fold of skin and passing a skein of silk thread underneath it through the cellular tissue above the deep fascia. For this purpose, a broad flat needle with a very large eye is used, and the skein of silk is loosely knotted, and should be moved a little each day backwards and forwards as soon as suppuration has commenced. When the object is to empty an abscess or a cyst, one or two threads run through with a common needle will suffice. S. are used as counter-irritants, as a drain on the system at large, and to excite inflammation and adhesion; but S. are but rarely used in the surgery of the present day.

Set'ter, a kind of dog, so named from its habit of 'setting' or crouching when observant of game. As now bred, it may not 'set,' but may simply rest and 'point.' The soles of the feet are hairy. The various breeds of S. are the English, Irish, and Russian S. Most bear evidence of the admixture of the blood of the spaniel with that of the pointer. The Russian and English breeds produce a valuable cross, which takes readily to the water, and is very active and intelligent.

Settlement in its general legal sense is a disposition of property for certain purposes by the owner, who relative to the disposition is called the settler or grantor. A S. may be either by deed or by will, but the term is usually only applied to a S. by *Deed* (q. v.). The most important kinds of S. are those relating to marriage. See CONTRACT. Regarding S. of paupers see POOR LAWS.

Setu'bal (Fr. *St. Yves*, Dutch, *St. Ubes*), a seaport of Portugal, province of Estremadura, on the N. side of the Bay of S., at the mouth of the Sado, 13½ miles by rail S.E. of Barreiro, opposite Lisbon. The harbour is defended by five forts. S. exports wine and is the chief seat of the Portuguese salt-trade. In 1874, the export of salt amounted to 33,000,000 imperial gallons. In 1875, S. possessed 43 vessels of 2166 tons. Pop. (1864) 13,134.

Seven was regarded as a sacred number among most of the nations of antiquity, the cause of which is to be traced to the influence of the *seven* planets of astrology and star-worship. There were seven degrees in the mysteries of Mithras, seven primitive colours, seven critical days in medicine, seven strings to Apollo's lyre, seven pipes to Pan's flute, and seven gods in the Scandinavian mythology, &c. That seven was also regarded as sacred by the Hebrews is abundantly manifest from their Scriptures. The creation was completed in seven days (Gen. i.); Noah took clean animals into the Ark by sevens (vii. 2, 3), and waited seven days before sending out the dove (viii. 8-12). The ears of corn and the kine in Pharaoh's dream came up by seven (xli.), and there were seven branches on the golden candlestick (Exod. xxv. 37). The blood of propitiation was to be sprinkled seven times (Lev. xvi. 14), seven Sabbaths were to intervene between the offering of the first-fruits and Pentecost, the day of Atonement was the seventh of the tenth month, the Passover and Feast of Tabernacles each lasted seven days (Lev. xxiii.), and, in fact, the whole circle of festivals was regulated by the number seven (see SABBATH). The number continued to have the same influence among Christians. The Apocalypse is full of it—for stars, angels, churches, lamps, eyes, seals, vials, &c. It enters into the systems of many of the heresies of the early Church. The Schoolmen made the Cardinal Virtues (q. v.) seven; opposite to which were seven deadly sins. And the Catholic Church made seven the number of her sacraments.

Seven Sleepers were seven Christians of Ephesus, who, according to a legend recorded by Gregory of Tours in his *De Gloria Martyrum*, when fleeing from persecution in the time of the Emperor Decius (249-51), took refuge in a cave near that city. They were discovered by their pursuers, and the entrance of the cave was walled up. But instead of starving to death, as was expected, they fell into a deep sleep, in which they continued till the reign of Theodosius, when they awoke (447) to find Christianity no longer persecuted, but the accepted religion of the people, and themselves received in triumph by the Ephesians.

Seven Wise Masters, a cycle of Eastern fables, also known as the *Book of Sindbad the Wise*, whose oldest existing source is the eighth chapter of a collection of Sanskrit stories, the *Sukha Saptati*. From India it found its way to Persia, Arabia, and Syria, and thence was introduced into Europe by the Crusaders of the 11th c. A certain Jean, monk of the Abbey of Haute Seille, in the diocese of Nancy, compiled two Latin versions of the story, the first entitled *Historia Calumniæ Novercalis, quæ Septem Sapientum Dicitur* (1184; printed at Antwerp, 1490), the second, a shorter, *Johannis de Alta Silva Dolopathos seu de Rege et Septem Sapientibus* (1212; ed. by Oesterley, Strassb. 1873). From these, again, proceeded *Les Romans de Dolopathos* (Par. 1856) of the 13th c. *trouvère* Heliers, the anonymous *Romans des Sept Sages* (Tub. 1836), and numerous English, German, Spanish, and Italian versions. Dolopathos, in the Western form of the story, is a king of Sicily, whose son Lucien is falsely charged by the queen, his stepmother, with having sought to do her violence. Bound by a promise to his tutor Virgil, then absent on a journey, not to open his lips till the latter's return, Lucien is about to be burnt, when one of the seven sages of Rome arrives and gains him a day's respite by promising to tell a story showing the falseness of womankind. The same thing happens on six successive days, and on the seventh comes Virgil, who clears his pupil and convicts the queen. One of the stories thus narrated furnished Shakespeare with the plot of his *Merchant of Venice*, and another reappears in the *Knight of the Swan*. See Comparetti's *Ricerche intorno al Libro di Sindbad* (Milan, 1869).

Seven Wise Men, the collective titles of certain Greek sages who flourished in the 7th and 6th centuries B.C., and whom Plato enumerates (*Protag.* 28) as follows:—Thales, Pittacus, Bias, Solon, Cleobulus, Chilon, and Myson, while others for the last substitute the Corinthian 'tyrant' Periander, the Scythian Anacharsis, Epimenides of Crete, &c. The aphorisms ascribed to them are given in Orelli's *Opuscula Græcorum Veterum, Sententiosa et Moralia* (Leip. 1819). See Bohren, *De Septem Sapientibus* (Bonn, 1867).

Seven Wonders of the World, as given by Philon of Byzantium in his *Peri tōn hepta Thaumaton* (best ed. by Orelli, Leips. 1816), were the Hanging Gardens (q. v.) of Babylon, the Pyramids (q. v.), Phidias' statue of Zeus Olympios, the Wall of Babylon, the Colossus (q. v.) of Rhodes, the Temple of Artemis at Ephesus (q. v.), and the Mausoleum (q. v.) at Halicarnassus.

Seven Years' War (also called **Third Silesian War**), the war carried on from 1756 to 1763 by Friedrich II. of Prussia, in alliance with England, against Austria, Russia, France, Sweden, Saxony, and most of the smaller German states. Friedrich, learning that a great coalition was formed against him, anticipated his enemies (August 1756) by occupying Saxony. Passing thence into Bohemia, he defeated the Austrians at Lowositz (October 1), and on the 15th the Saxon army capitulated. The year following he could bring but 200,000 men, with 40,000 auxiliaries from Hanover, Brunswick, Hessen, and Sachsen-Gotha, against the 430,000 of his enemies. The victory of Prag was soon lost in the reverses of Kollin, Hastenbeck, Kloster-Seven, and Grossjägerndorf, but at length Rossbach and Leuthen turned the tide in Friedrich's favour: 1758 brought the victories of Krefeld and Zorndorf, and the severe defeat of Hochkirch. The year 1759 was unfortunate for the Prussians. Prince Ferdinand of Brunswick indeed gained the victory at Minden (August 1), but the ruin of Prussia seemed certain after the defeat of Kunersdorf (August 12), and in January 1760 Friedrich was forced to leave Daun in possession of Saxony. In the latter year the Prussians were again defeated at Landshut, but gained the victories of Liegnitz and Torgau. 1761 was uneventful, and on the death of the Empress Elizabeth (5th May 1762), Peter III. formed an alliance with Friedrich. Sweden on the 22d May signed a peace at Hamburg, and in 1763 the Peace of Paris between France and England (10th February) and the Treaty of Hubertsburg (15th February) closed the war, leaving things exactly as before it began, save that Prussia had now learned her own strength, and had risen from a petty kingdom to the rank of a great power. See the histories of this war by Archenholz (9th ed. 1867), Schäfer (2 vols. Berl. 1867-70), and Ranke (Leips. 1875).

Severalty. In English law, when an estate is held by one person exclusively, it is said to be held in S.

Severn (Lat. *Sabrina*), next to the Thames, the largest English river, rises on the E. side of Plinlimmon, in Montgomeryshire, 1500 feet above the sea-level. To Llanidloes, a distance of 12 miles, it retains its ancient British name of *Hafren*. It flows N.E. through Montgomeryshire past Newtown and Welshpool, turns S.E. through Shropshire past Shrewsbury and Bridgenorth, enters Worcestershire at Bewdley, flows S. past Stourport and Worcester, enters Gloucestershire at Tewkesbury, and after a S.W. course, passing Gloucester falls into the Bristol Channel, dividing by its estuary Monmouthshire from Gloucestershire and Somersetshire. Its basin has an area of about 6000 sq. miles; its total length is about 200 miles, and it is navigable for barges as far as Welshpool, a distance of 180 miles. The effect of the great tidal bore or eage running up the Bristol Channel is perceptible 120 miles up the S. Its principal tributaries are, on the right, the Teme and the Wye, and on the left the Terne and the Upper and Lower Avon, while a system of canals places it in connection with other large rivers. A railway bridge in 22 spans, 3581 feet long, by which a junction is effected between the Great Western and Midland Railways, is now (1878) in course of construction across the S. at Purton Passage, near Sharpness.

Severus, Alexan'der. See ALEXANDER SEVERUS.

Severus, Lucius Septim'ius, a Roman Emperor, born near Leptis Magna, on the coast of Africa, April 4, 146 A.D. After holding the highest offices under Marcus Aurelius and Commodus, he obtained command of the legions in Gaul, and when in 193 news came of the murder of Pertinax, he was proclaimed emperor, and immediately marched on Rome. Julianus, to whom the pretorian guard had sold the imperial purple, was deposed and executed. Meanwhile the Roman legions in Asia had proclaimed their general, Pescennius Niger, emperor. S. overthrew him at Issus in 194. After a successful campaign against the Parthians he returned to Rome, but was soon engaged in a struggle with another rival, Clodius Albinus, whom he conquered at Lugdunum in 197. New campaigns in the E. were ended by the capture of Ctesiphon, the Parthian capital. S. then spent several years (202-208) at Rome, gratifying the people by his magnificence, and distributing large donations to the troops. In 208, he hastened to Britain to quell a rebellion there; but after an undecisive campaign, and just as he was planning a new attack upon the Caledonians, he died at Eboracum (York), February 4, 211.

The Wall of S. is the name given to a rampart erected by the Romans as the northern boundary of their British possessions. It stretched from the Solway to the Tyne, and was built of stone by the Emperor S. in 208, about 60 yards in front of Hadrian's earthen rampart. The total length of the wall was 63½ miles, its height probably about 18 feet, and its thickness from 6 to 10. The forts along it were erected at intervals of about 4 miles. The works appear to have been very substantially constructed. Most of the ditch and many parts of the wall can still be traced. S. W., called *Gual Sever* by the Britons, was subsequently known as the *Picts' Wall*, but is now called the *Roman Wall*. See *The Roman Wall, &c.*, by Bruce (Lond. 1853).

Séguin, Marie de Rabutin-Chantal, Marquise de, born at Paris, February 6, 1626, was the daughter of Baron de Chantal and Marie de Coulanges. An orphan at the age of six, she was left to the care of her maternal uncle, who intrusted her education to Menage and Chapelain. She made her debut in society as a linguist, a beauty, a wit, and an heiress. In 1644 she married the Marquis de S., a man who squandered much of her fortune upon mistresses. It was said of this unfortunately matched couple, that he respected without loving her, and that she loved without respecting him. The Marquis was killed in a duel in 1651, and his wife devoted herself to the education of her son and daughter. Many were the suitors who surrounded the beautiful widow; but widow she remained—one of the brightest and purest among the celebrated women of her day. In 1669 the daughter whom she idolised married the Marquis de Grignan, who soon after removed from Paris to become lieutenant-general in Provence. The mother's tenderness for her child now poured itself out in the celebrated letters which even before the writer's death were talked of as models of

graceful, piquant, epistolary style. While on a visit to her daughter in Provence, she was attacked by smallpox, and died at Grignan (Drôme), April 18, 1696. Her letters were first printed in the incomplete edition of 1726 (2 vols. The Hague). The best edition is that of Regnier (12 vols. 1862-64). An English translation of the letters was published in London (9 vols. 1811). See Walckenaer's *Mémoires touchant la Vie et les Écrits de Mme. de S.* (Par. 5 vols. 1842-52); *Madame de S. and her Contemporaries* (Lond. 2 vols. 1841); and J. Babou's *Les Amoureux de Mme. de S.* (Par. 1862).

Seville' (Span. *Sevilla*), a famous city of Spain, capital of the province of S., on the left bank of the Guadalquivir, 80 miles from its mouth, and 353½ miles S.W. of Madrid by rail. The river is crossed by a fine iron bridge connecting S. with Triana (the gipsy quarter), one of its seven suburbs. The city proper, which is surrounded by old Moorish walls, 5 miles in circumference, with 66 towers and 15 gates, contains a labyrinth of narrow crooked streets. The houses are mostly built in the Moorish style, and are seldom more than two stories high, with flat roofs, and an inner square court surrounded with colonnades and adorned with flowers and fountains. The windows generally look into this court: to the street there is most frequently only a balcony. S. has many fine promenades, of which the most frequented are the Alameda Vieja, El Paseo de Christina and Las Delicias. Of its 111 squares, the largest are Plaza de San Francisco, Plaza de la Encarnacion, Plaza del Duque, and the Quemadero—the scene of the *autos-da-fe*; while of its 477 streets, the chief are Calle de la Sierpe and Calle Francos. Most of the more notable public edifices are at the S. extremity near the river, and within a short distance from each other. Here are the Cathedral (Santa Maria de la Sede), the Giralda, the Alcazar, the Lonja, and (outside the wall), the royal Fabrica de Tabacos. The Cathedral (1401-1519), on the site of the grand mosque of the Moors, is one of the most imposing Gothic edifices in Europe. It is 431 feet long, 315 feet wide, 145 feet high under the transept dome, has seven aisles, 93 windows, several of which are beautifully painted, and an organ with 5400 pipes. It contains the Biblioteca Columbiana of 20,000 vols., bequeathed by Ferdinand Columbus, and is rich in paintings by Murillo, Campaña, the Herreras, and other masters of the school of S. The Giralda is a square Moorish steeple, consisting of three towers with galleries and balconies, 350 feet high, the ascent of which is by a spiral inclined plane. On the top is a bronze statue of Faith, 14 feet high, and weighing 2800 lbs., which yet turns like a weathercock. The Alcazar was the ancient Moorish palace. Some parts of its interior are as fine as the Alhambra. The Lonja, or Exchange, is a square building, each side 100 feet long, in which all the American archives are preserved. The Fabrica de Tabacos, or tobacco-factory, in which 5000 women are employed, was erected in 1757, at a cost of £390,000. Other buildings are the Torre del Oro, a twelve-sided tower on the river, so called from its having received the cargoes of the American treasure-ships; the palace San Telmo, built by Ferdinand Columbus, now belonging to the Duke of Montpensier; Casa del Ayuntamiento (town-house), a fine old Moorish structure; the Casa de Pilatos, or palace of the Dukes of Alcalá; the Museo, rich in paintings by Murillo, Zurbaran, Torigiano, Roelas, and the elder Herrera; and the great amphitheatre, capable of accommodating, as a Plaza de Toros, 18,000 people. One of the greatest monuments of antiquity is the Caños de Carmona, an aqueduct on 410 high arches, which conveys water from Alcalá de Guadaira. It was built by the Romans and repaired by the Moors. S. has a University, founded 1504, with a library of 20,000 volumes, now attended by 1000 students; 12 picture-galleries (including the Museo), 2 theatres, several upper schools and learned societies. The city is visited by large numbers of strangers during the Santa Semana ('holy week'), which commences about the middle of April. S. was formerly the emporium of commerce between Spain and her American possessions. It declined, however, as Cadiz rose into importance, but it is still a place of considerable trade, and has a great export of oranges, and large manufactures of tobacco, hardwares, porcelain, and silk. The total value of the imports in 1876 was £1,052,392 (from Great Britain and British colonies, £492,686); and of exports £673,429 (to Great Britain and British colonies, £410,360). In the same year 511 vessels of 115,327 tons arrived at the port, of which 116 of 24,419 tons were British. Pop.

(1877) 118,888. S. was the *Hispalis* of the Romans, in whose time it was a place of great commercial importance. Under the Vandals and Visigoths it became the capital of S. Spain. Within its walls were held the Concilia Hispalensia, 590 and 619. In the 8th c. it fell into the hands of the Moors, by whom it was called *Ischbilis*, and made capital of a califate. It now became the most flourishing city in the peninsula, having a pop. of 400,000. In 1248 it was taken, after a siege of 18 months, by Ferdinand III. of Castile, and has ever since remained in the hands of the Christians. See Wackernagel, *Sevilla* (Bas. 1854).

Sèvres, a town of France, department of Seine-et-Oise, on the left bank of the Seine, 6 miles S.W. of Paris by rail. Its famous manufactory of porcelain, established in 1755, employs 200 workmen. The museum was destroyed in 1870, but a new manufactory was inaugurated in 1876, containing two museums, one for the works of artists of S., the other for specimens of pottery of all ages and nations. In 1875 a school of mosaic work was also established. Pop. (1876) 6512.

Sèvres, Deux, a department of Western France, so called from the two rivers, *Sèvre Niortaise* and *Sèvre Nantaise*, which flow through it, the former into the sea, the latter into the Loire. It is bounded N. by Maine-et-Loire, E. by Vienne, S. by Charente-Inférieure and Charente, and W. by Vendée. Area, 2310 sq. miles; pop. (1876) 336,665. The soil is fertile, but agriculture is backward. In 1876 the yield of wheat was 4,290,000 bushels. S. has iron and coal mines, marble and freestone quarries, and manufactures coarse linen and woollen stuffs. Its breed of mules is famous in the Alps and the Pyrenees. The chief towns are Niort (the capital), St. Maixent, Parthenay, Thouars, and Melle.

Sewage is the matter which passes through the drains, conduits, or sewers leading away from human habitations singly, or from houses collected into villages, towns, and cities. It is made up of excreted matter, solid and liquid, the water necessary to carry such away, and the waste water of domestic operations; but to these are added the liquid waste products of manufacturing operations, and generally much of the surface drainage water of the area in which the conveying sewers are situated. While human beings live in a nomadic or rural state, the treatment of excreta and other waste materials presents little difficulty; but as soon as communities form, the removal of S. becomes a question of the most vital concern; and in proportion to the population both the necessity and the difficulty of adequately disposing of such matter are increased. There can be no doubt that the pestilence and plagues which at frequent intervals devastated ancient and medieval cities were almost invariably caused, and always intensified, by the entire absence of any system for treating or removing excreta and other decaying organic matter; and even yet, notwithstanding the assiduous regard paid to sanitary science in most well-governed towns, many diseases are directly traceable to the noxious influence of decomposing S. matter. The dense packing of human beings in modern towns, and the concentration of manufactures in such centres, have enormously increased the magnitude and importance of the S. question; and it is not too much to say that the efficient and economical treatment of towns' S. is the greatest and most urgent social problem of our times.

The question presents itself in a twofold aspect: (1) the necessity for the prompt and complete removal of S. from the neighbourhood of human dwellings, and its disposal in a way the least offensive and injurious to health; (2) the desirability of saving, for agricultural purposes, the rich and essential fertilising agents which S. contains. To the sanitary officer the former is the question of greatest moment, to the agriculturist the latter; while the mass of the population has an equal interest in both. In almost every scheme propounded for dealing with S., cognisance is taken of both these points, and thus the problem becomes more difficult of solution.

The composition of S. as it passes outwards, varies greatly, as regards amount and condition of organic matter it contains, and the season of the year—hot or cold—affects very considerably the activity of chemical action. But at all times sewer gases are given off which are fetid and offensive to smell, containing sulphuretted hydrogen, light carburetted hydrogen, free nitrogen, and carbonic acid. The precise influence of such gases on the health, of course, varies with the amount of dilution they undergo before being breathed, and the result of observa-

tions under many conditions are rather conflicting. While air contaminated with sewer gases aggravates all diseases, especially those of a febrile nature, there is good ground for believing that choleraic diarrhoea and typhoid fever are directly communicated by emanations from sewers. To prevent such sewer gases from penetrating into houses by means of the drains and pipes, and to keep the S. from saturating the surrounding soil, and from contaminating any water supply, are objects of prime importance. To accomplish these, the pipes leading from dwellings into main drains and sewers require to be trapped, and the sewers themselves ventilated, drain pipes and tubes made of glazed earthenware or other non-absorbent material must be carefully fitted, and the main sewers made either of pipes of large diameter or of hard bricks bedded in Portland cement. Sewers are properly built in cross section; they should have a uniform gradient, and be as far as possible built free of curves, so that the S. matter may be carried forward without any tendency to silt or deposit at particular spots. It is also essential that there be ready access to the sewers, as well as to the smaller drains leading into them.

The entrance of sewer gas into houses is provided against by external ventilation of the pipes and by trapping the pipes either by a syphon arrangement, a midfeather, or a flap-trap. The syphon, which is used in connection with water-closets, consists simply of a deep bend on the exit tube, which bend is at all times filled with water. The midfeather is a modified kind of syphon, consisting of a trough having an inlet and discharge pipe at the same level on opposite sides, but between them a partition passes down into the water with which the trough is always filled up to the level of the two pipes. Such traps are usually put upon sinks. The flap-trap consists simply of a hinged valve which opens outwards to allow the escape of S., &c., but which closes against the resurgence of water or the inward pressure of gases. Modified forms of these varieties are numerous; but the general principle of all traps is based on one or other of these forms. The accompanying fig. 1 represents in

Fig. 1.

Fig. 2.

section an approved form of syphon trap, designed for use in wash-houses, asphalted courts, &c. Figs. 2 and 3 are vertical sections of ventilating drain-traps, in which the S. is made to fall into the trap over a sharp edge, whereby solid excreta is broken up, well mixed with liquid, and is washed away. In fig. 4 is shown a system of drains, with their trapping and ventilation, and the connection with a common sewer, as adapted for a dwelling through and under which the house drain passes. In this plan a ventilating syphon trap, on the principle patented by Mr. W. P. Buchan of Glasgow, is placed between the house and the sewer, whereby sewer gas is effectually locked off from the house, and at the same time a current of fresh air is allowed to enter the drain by the grating A, which, passing through the drain pipe, dilutes the gas it may contain, and escapes again into the open air above the roof at F.

Fig. 3.

There are two systems by which excremented matter is dealt with for removal: (1) by water carriage, and (2) the dry method. Water-borne S. is disposed of in the following several ways:—1. Running it into the sea, or into a tidal river, under conditions that will prevent its return, or into open streams; 2. Irrigation; 3. Intermittent filtration; 4. Purification by precipitation—(a) by lime; (b) by sulphate of alumina; (c) by the A B C system.

And under the dry method the following are the principal plans in operation:—1. Pan closets; 2. Earth closets; 3. Goux system; 4. Stanford's system; 5. Liernur's pneumatic system.

Fig. 4

The adoption of one or other of these methods in various towns has been determined partly by the circumstances of geographical position, and partly by the domestic sanitary arrangements already existing. The water-carriage method is alone practicable in towns like Edinburgh and Glasgow, where water-closets are almost universally used; and whether the S. passes into an inland stream or the sea depends on the position of the town. The practice, however, of discharging S. into inland streams is universally condemned, and measures are being taken to stop and prevent it in all large towns. In the city of Glasgow the S. at present passes direct into the Kelvin and Clyde, making these waterways no better than huge open sewers. The S. of London is carried by two great culverts on each side of the Thames to Barking and Crossness, where with each receding tide it is carried away into the open sea. A S. farm exists at Barking, to which a proportion of the S. is applied. The irrigation method is employed to a large extent in the disposal of Edinburgh S., enormous crops of rank grass being grown on the sandy soil of Craighentiny Meadows, lying between the city and the Frith of Forth, over which the S. passes without causing any local nuisance. The same method is most completely worked at Croydon, and probably the Beddington Manor estate there is the most successful of the S. farms; it disposes of the S. of a population of 60,000 persons, at an outlay which is now reduced to little over £1000 per annum.

The irrigation method has, however, not answered the great expectations of those who regarded it as the perfect solution of the S. problem. Systems of purification by chemical treatment are in operation in various English towns, including among others, Birmingham, Bradford, and Leeds; but the result is not satisfactory, either from a sanitary or economical point of view. The so-called A B C process, a name derived from the initials of the three materials employed in it—Alum, Blood, and Clay—has received the greatest amount of attention, and a thorough trial. The materials actually used at Leeds for the treatment of from 12 to 14 million gallons of S. were alum 3 tons, charcoal 3 tons, clay 6 tons, and lime 12 tons, but the manure obtained thereby has been found practically unsaleable. See *Report of the River Pollution Commission* (1870). The Society of Arts Conference on Health of Towns and S. in their report also say:—'With regard to the various processes based upon subsidence, precipitation, or filtration, it is evident that by some of them a sufficiently purified effluent can be produced for discharge without injurious result into watercourses and rivers of sufficient magnitude for its considerable dilution; and that for many towns, where land is not readily obtained at a moderate price, those particular processes afford the most suitable means of disposing of water-carried S. It appears, further, that the sludge, in a manurial point of view, is of low and uncertain commercial value; that the cost of its conversion into a valuable manure will preclude the attainment of any adequate return in the outlay and working expenses connected therewith, and that means must therefore be used for getting rid of it without reference to possible profit.'

Of the various dry methods of removing excreta, the pail-and-tub system is in extensive use in Manchester, the charcoal system has been fully tested at Oldham, the Goux plan has been in operation at Halifax, the earth closet is fully described under that heading, and Captain Liernur's plan is carried out in various Dutch towns. The following is an outline of the Manchester system. At present in the city there are comparatively few water-closets. There are 42,000 privies, and these are gradually being altered into pan-closets. Already 24,000 have been thus converted, and Dr. Leigh, the medical officer of health, expects that in three years the whole will have been altered. The system of conversion is the following:—The privy is removed and the ground upon which it stood, and which is necessarily saturated with filth, is dug up to the depth of several feet, and carted away, and the space filled in with clean furnace ashes. Upon this the privy, with compartment for cinders, is built, and the whole roofed over. The cost of each privy is £4. 4s., when erected by the workmen belonging to the corporation, who charge the owner of the property the net outlay. The pails are constructed of galvanised iron, and are made, and, when necessary, repaired at the corporation depot in Water Street. Attached to each closet is a cinder-sifter, and the fine cinders and ashes mix with the excreta, and make it more manageable than it would be in its pure state. Separate tubs are used for the coarse cinders and general refuse of the houses. Dr. Leigh calculates that when all the privies are converted, 6,000,000 gallons of urine annually will be kept out of the sewers, and consequently out of the Irwell, that were formerly allowed to flow into it. The old-system privies are emptied during the night, but the pan-closets are removed during the day—vans specially constructed for the purpose being used. They have five compartments, one of which is open and uncovered, and this receives the dry refuse; the other four are covered and enclosed with closely-fitting doors. When the loaded vans reach the yard, they are first weighed, afterwards they are taken on to the first floor of a two-storey building, where the dry refuse from the open part of each van is unloaded, and shovelled into sieves worked by steam-power. By this arrangement the fine dust, widely diffusing itself in its descent, falls on the floor below, covering the contents of the pails, which are, at the same time, being emptied on to gratings fixed in the floor. At one end the bars are set much more closely together than at the other, and serve to convey the liquid portion of the contents of the pails by means of troughs to a tank, from which it is afterwards removed to an apparatus called a concretor. The solid portion of the excreta falls through the wide barred portion of the grating into suitable receptacles. The rough portion of the dry refuse, after being separated from the fine, is carried along an endless band of wooden bars to the mortar mills, the boiler, or to one of the various furnaces, of which there are several in the yard. The dry refuse is of such a heterogeneous character as to require varied modes of treatment. The cinders are separated and used for fuel for the boilers and furnaces (no coal whatever being allowed in the yard); the remaining portion of the rubbish is taken to the carbonisers (of which there are eight), and the material, often of an obnoxious description, is therein carbonised, and converted into a harmless and useful substance. In another part of the yard is a second set of furnaces, called destructors, which are used for the purpose of destroying rubbish which formerly had been deposited in large heaps in every suburb of the city. These destructors not only consume the objectionable material, but furnish heat to the concretors, large cylinders laid horizontally, and revolving by steam-power, in which the liquid of the pails (chiefly urine) is evaporated to one-tenth of its bulk, and afterwards formed into a valuable manure by being mixed with two-thirds of its weight of charcoal from the carbonisers. The spent fuel is carted to the mortar-mills, and there ground up with broken earthenware and glass, fine ashes, and lime, to form a most excellent mortar, which contains one-third of its weight in lime, and sells readily at 4s. 6d. a ton: 400 tons of manure are made weekly, and sold at 12s. 6d. per ton. The carboniser, the destructor, and the concretor have all been invented and patented by Mr. Alfred Fryer, of the firm of Manlove, Alliot, & Co., engineers, Nottingham. Some of the above details are taken from a paper in the *British Architect* for 29th September 1876.

The charcoal or carbon system is worked under a patent obtained by Mr. E. C. C. Stanford, of Glasgow, and consists in

submitting the excremental matter to destructive distillation, whereby a kind of animal charcoal and ammonia are evolved.

The Goux system, as it is called, is adopted at Halifax for the dry closets. The tubs are of wood, about sixteen inches high and 20 inches wide at the top. They are lined with a mixture of street sweepings, fine ashes, shoddy, tow, and sawdust, or any absorbent material that can be procured at little or no cost. A little is put at the bottom, then a mould of 15 inches diameter, and provided with a handle at the top, is inserted, and around this the absorbent material is packed, after which the mould is withdrawn and replaced by a thin sheet-iron cylinder. It is stated that a man can pack 80 tubs in an hour. The centre cylinder is not removed until the tub is put in position. On removing the tubs, when full, a little charcoal, soot, or gypsum, is placed on the top, but there are no covers to the pans.

The distinctive feature of the Liernur or pneumatic process is that the night-soil, with or without a limited quantity of water, is drawn by means of a vacuum to a central dépôt, where it is evaporated to dryness in vacuo, forming a 'poudrette,' which possesses a high manual value, and may truthfully be called native guano. 'As may be imagined,' say Messrs. Robert Rawlinson & Clare, in a report on the system presented to the Local Government Board in July 1876, 'when the nature of the arrangements and complications are considered, the pneumatic system gets out of order, the slightest crack in any pipe or pipe-joint will reduce the force of the partial vacuum, and even when all the apparatus remains sound, the closet pans may not be emptied; and, in fact, neither the pipes nor the pans ever are entirely emptied. The power of air and water to remove solids through pipes is proportional to their relative weight and velocity, and air is to water, by weight, about as 800 to 1.'

The Society of Arts Conference on Health and S., dealing with the dry systems at their meetings in May 1877, reported: 'That the pail system, under proper regulations for early and frequent removal, is greatly superior to all privies, cesspools, ash-pits, and middens, and possesses manifold advantages in regard to health and cleanliness, whilst its results in economy and facility of utilisation often compare favourably with those of water-carried S.:' but that, 'for use within the house, no system has been found in practice to take the place of the water-closet.'

Seward, William Henry, an American statesman, born May 16, 1801, at Florida, Orange county, New York. Educated at Union College, Schenectady, he began business as a lawyer at Auburn, New York, in 1823, and in 1825 made his first political appearance in a 4th of July oration. It was, however, in connection with a great agitation against Freemasonry in 1830 that he first came prominently into the political arena. He was elected in that year to the New York Senate, and in 1838 was chosen governor of New York. He now began to appear as an Abolitionist, and was a prominent member of the 'Black Republican' party. Elected in 1849 to the U.S. Senate, he soon became the acknowledged leader of the party, and in the presidential election of 1860 was the leading Republican candidate, though Abraham Lincoln was ultimately elected. Under Lincoln he became Secretary of State, and conducted the diplomacy of the U.S. during the whole civil war with great ability and success. At the time of Lincoln's assassination, a man named Paine attempted to assassinate S. also, but only succeeded in dangerously wounding him, and at the same time stabbing his son who was also in the room. S. continued in office under President Johnson, and until the accession of President Grant in 1869. He had visited Europe in 1833 and 1859, in 1871 undertook a tour round the world, and on his return died at Auburn, October 10, 1872. He published *Speeches, State Papers, &c.* (4 vols. New York, 1853-62), and a *Life of J. Q. Adams* (New York, 1849). See *Autobiography of W. H. S. from 1801 to 1834; with a Memoir of his Life, and Selections from his Letters from 1831 to 1846* by F. W. Seward (Lond. 1877).

Sewing-Machine. The various forms of this now well-known and almost universally used machine are all of quite recent introduction, being the invention of men who, for the most part, are still (1878) alive. Although really practical and efficient sewing-machines are thus the invention of our own day, many attempts to produce apparatus capable of imitating hand-sewing and similar effects were made at earlier periods; but none of these was successful except within very narrow limits. The early inventors set themselves chiefly to imitate by mechanical

means the ordinary process of hand-sewing with all its disadvantages of a limited and ever-varying length of thread, slowness of operation, and constant friction on the thread. The invention of the double-pointed needle with an eye in the centre, in the year 1755, marked a distinct advance towards the invention of the S.-M., and it was itself used in a form of machine for producing the 'shoemaker's stitch.' In the eye of the double-pointed needle the sewing-thread was fastened, and by a pair of grippers or mechanical fingers the needle was pushed and pulled alternately from the opposite sides of two folds of the material to be sewed. Another form of apparatus which was at one period in use in print and dye works consisted of two fluted rollers between which the edges of cloth to be united were passed, whereby they were so crimped or folded together, that they were easily 'spitted' on a long straight needle, held stationary between the wheels, and thus a kind of running or basting stitch of an insecure nature was produced. In 1853 Barthelemy Thimonnier, a Frenchman, obtained in his native country a patent for a form of S.-M. which was for some time successfully worked, and which was in effect the parent of the single-thread machines now in use. In Thimonnier's apparatus, which was constructed largely of wood, the thread-carrier was placed under the table whereon the fabric to be sewed was laid. The needle was in the form of a crotchet hook, and having a descending and ascending motion, it passed through the cloth, brought up a loop of thread, which was caught and retained by a nipple till the hooked needle brought up a second loop. The second loop passed through loop No. 1, which thereupon was released and drawn tight, a chain stitch was thus formed, and the cloth being moved forward the length of a stitch, the process was repeated and continued. The apparatus was for some time in considerable use in France, being adapted for embroidering as well as sewing, and when worked without any cloth it formed an ordinary crochet chain or looped cord. The invention of the eye-pointed needle by Newton & Archibald, patented in 1841, and applied by them to the stitching and tambouring of the back of gloves, formed the most important step in the progress of developing the S.-M., and in no essential principle did their machine differ from the single-thread machines now in use. In 1844 an invention by John Fisher was patented jointly with James Gibbons, in which a shuttle and needle were used for producing a lock-stitch, and by a different combination the patent covered the production of what subsequently was known as the Grover & Baker, or knotted stitch. Their machine was specially intended for stitching and ornamenting lace, but it was also described as useful for uniting fabrics. It will be thus seen that although the S.-M. is usually spoken of as being entirely American in its origin, all its essential features were covered by English patents before Elias Howe's invention was patented in America by himself, and in England by William Thomas in 1846. There is no doubt, however, that Howe, after several years' labour and study, worked out the idea of his S.-M. without any guidance from or knowledge of what had been previously accomplished; and he moreover secured such effective combination of parts as made the Howe machine in reality the acknowledged parent of all the forms since introduced. Mr. Howe's patience and tenacity of purpose did indeed as much for the success of the S.-M. as his inventive skill. His patent-right for Great Britain was sold for £250 to Mr. Thomas, in whose employment Mr. Howe worked for about two years. On returning to America in 1849, Howe found that his patent-right notwithstanding, several individuals had made, exhibited, and used sewing-machines, although not a single machine had yet been made in America under his patent. He had therefore to face the task of vindicating his rights, and at the same time to introduce to the public his machine. It was not till the end of 1850 that the manufacture of his machine actually began, and it was 1854 before a decision in his favour against J. M. Singer was obtained, in which the judge declared that 'for all the benefit conferred upon the public by the introduction of a S.-M. the public are indebted to Mr. Howe.'

The modifications, improvements, and additions made to the S.-M. since its introduction are innumerable. It has now been adapted to produce almost all kinds of stitching which can be done by the hand; and every variety of work required on garments. The leading classes of machines are—

- 1st, Single-thread machines.
- 2d, Machines with two or more threads.
- 3d, Overhead or glove-stitch machines.

Single-thread Machines.—The stitch made by the ordinary form of single-thread machine is precisely what is known as the crotchet-stitch, and when the thread is broken at any point the whole work readily undoes. Ordinary single-thread machines, unless for limited applications, such as glove embroidery, are passing out of general use. It is different, however, with the Willcox & Gibb's single-thread machine, in which a revolving double-hook or looper is employed which gives each loop a twist and produces thereby the twisted chain-stitch, combining a solid fastening with great elasticity and smoothness. The Willcox & Gibb machine is very simple in construction, light to work, fast and noiseless, and altogether well adapted for family use.

Two-thread Machines.—Of these machines two subdivisions may be recognised—the lock-stitch, and the knotted or double chain-stitch, commonly called the Grover & Baker machines. Of these, the lock-stitch machines are by far the most common, and for general purposes are in almost universal use. For producing the lock-stitch there are two forms of apparatus—1st, the reciprocating shuttle which carries a thread through the loop made by the needle; and, 2d, the lenticular spool or thread-case over which the loop is passed by a revolving hook. Of the first kind—shuttle-machines—the Howe, the Singer, the Wanzer, and others are familiar forms; the second, or spool and hook appliance, is a peculiarity of the Wheeler & Wilson alone. In the various shuttle-machines the driving-gear and other details are different, but, as now perfected, the essential combinations and action of the whole are similar. The principal points for consideration are the tension of the upper thread, the motion of the eye-pointed needle, the action of the presser foot and the feed motion, and the driving of the shuttle on the shuttle race, with the adjustment of the tension of the shuttle thread. The upper or needle thread tension is secured in most machines by passing the thread round a circular disc or pulley, to the revolution of which any required amount of friction may be applied by the adjustment of a spring pressing against it. The needle was originally fixed at the end of a vibrating arm, and, describing the arc of a circle, it required to be curved. Singer first introduced the straight needle carried by a slide, and it now is in general use. The presser foot keeps the material firmly pressed against the surface plate by a spring pressure, which can be varied to suit the nature of the work. Next to the invention of the eye-pointed needle the designing of an efficient feed-motion was the most important improvement made in the S.-M. Singer introduced what is called the wheel-feed, but the plan now adopted is one of the many ingenious and beautiful mechanical devices introduced by Mr. A. B. Wilson of Wheeler & Wilson. It is called the four-motion feed, and consists of a serrated plate to which a forward, down, backward, and up motion is communicated, the forward and backward motion being varied according to the length of stitch. The tension of the thread in the shuttle is maintained by a small nipping spring which presses against the thread, Howe's original plan having been to secure friction by passing the thread through several holes in the side of the shuttle. In the Wheeler & Wilson machine the use of the shuttle is entirely avoided, and the lock-stitch is formed by carrying the loop from the upper thread over and around the under thread, which is contained within a small lenticular spool, which fits snugly but free in a recess in the side of the revolving hook. This exceedingly ingenious device, together with the four-motion feed above alluded to, place Mr. A. B. Wilson, their inventor, in the front rank of improvers of the S.-M. The Wheeler & Wilson machine as a whole works with great ease and smoothness, and as the machine can be noiselessly worked at a high speed, it is a great favourite for general domestic and light manufacturing uses. The ordinary Grover & Baker machine makes a knotted or double loop chain-stitch of a complex character. For general purposes it is not now in great favour, owing to the ridged nature of the seam it makes, and to the considerable waste of thread the peculiar nature of the stitch involves. On the other hand, the machine is rapid and smooth in action, it takes both upper and under thread direct from the spools, and for ornamental purposes its stitch is very useful and effective. Special machines have been devised for working button-holes, and by attachments to the ordinary machines button-hole stitching can be secured.

Overhead S.-M.—In overhead stitching two edges are sewed together by the thread passing over and binding in their outer extremities, a style of sewing generally seen in gloves and in-

variably used for sacks. In order to effect the sewing of sacks with this stitch by machinery, many attempts have been made, and some of them have attained a degree of practical success. In Laing's overhead machine, invented and manufactured in Dundee, a helical needle is employed, which in its motion of rotation passes from end to end of the sack seam, drawing the thread through with it. Other forms of overhead machine, it is understood, are at present being experimented on; but the difficulties to overcome in this style of sewing are very serious.

Sexagesima (Lat. 'sixtieth') is the Sunday which represents the sixtieth day before Easter (q. v.), although it is actually the fifty-sixth, and is named by analogy from Quadragesima (q. v.), the first Sunday in Lent (q. v.).

Sexagesimal Arith'metic, a method of computation used by the ancient astronomers for facilitating calculations, such as division and extraction of roots. Numbers were grouped in sixties instead of in tens as in the modern decimal system. To this day the method is employed in angular and time measurements.

Sex'tant, an instrument for measuring the angular distance between two given objects. The name is derived from the form of the instrument, which is a sector of a circle bounded by an arc of 60°. The principle of the S. may be thus stated: If an object is seen by reflection from two mirrors which are perpendicular to the same plane, the angle between the object and its image is double the inclination of the mirrors. Let A, B, be the two mirrors perpendicular to the plane of the paper, O the object, and E the eye. OABE is the path of the reflected ray, and the image will be seen in the direction of D. Produce the directions of A and B till they meet at C. Produce A B to P. By the law of reflection $\angle BAC = \angle EAC$ and $\angle PBC = \angle EBC$. Hence by Euclid I. 32

$$\begin{aligned} BEA + BAE &= PBE \\ &= 2 PBC \\ &= 2 (BCA + BAC) \\ &= 2 BCA + BAE \end{aligned}$$

and therefore

$$BEA = 2 BCA$$

In the S., the mirror A is attached to a movable limb AR, which can be set in any position between AQ and AP (see cut). The other mirror is fixed upon the limb AP, and is parallel to AQ. When AR is coincident with AQ, the index points to zero, and the mirrors are parallel. Further, $\angle BCA = \angle RAQ$; so that the angle subtended by the arc RQ is half the angle OED. Hence if D be a second object, and the image of O be made by moving AR to overlap it, the angle between these objects is twice the angle RAQ. The S. is usually employed for finding the altitude of a heavenly body, the image of which is brought into coincidence with the horizon viewed directly. To save trouble, the graduated limb is divided into 120 parts, so that the real angle between the objects is read off at once. The extremity R is provided with a vernier, and is furnished with clamps for fixing it in any required position. A complete instrument is also supplied with adjusting screws for setting A and B perpendicular to the plane of the S., and for fixing B in its true position parallel to AQ. Darkened glasses for shading either mirror, so that the sunlight is sufficiently diminished, are also sometimes necessary. The first instrument made upon this principle was Hadley's Quadrant. Sir Isaac Newton, however, had previously described a very similar instrument; so that to him the first idea of employing the laws of reflection for accurately measuring angles is undoubtedly due.

Sex'ton, is a corruption of *Sacristan*, one to whom the sacred vestments, &c., belonging to a church are intrusted. The duties

of the S. in the Church of England, who corresponds to the Scotch Beadle, are to keep the church clean, open it for divine service, wait upon the clergyman, act as grave-digger, &c.

Sex'tuplet or Sextolet, in music, six notes grouped together to be played in the time of four; in fact, a double triplet.

Sexual Selection, a biological theory, first enunciated by Mr. Darwin as part of his hypothesis of Descent of Natural Selection. In this theory the propagation of the characters and variations of animals and plants is said to be largely due to the selection by the females, as mates of the best-favoured and most brilliantly coloured males, and to the battles of males for the females. Of this theory Darwin says:—'This form of selection depends, not on a struggle for existence in relation to other organic beings, or to external conditions, but on a struggle between the individuals of one sex, generally the males, for the possession of the other sex. The result is not death to the unsuccessful competitor, but few or no offspring. S. S. is therefore less vigorous than natural selection. S. S., by always allowing the victor to breed, might surely give indomitable courage, length to the spur, and strength to the wing to strike in the spurred leg, in nearly the same manner as does the brutal cockfighter by the careful selection of his best cocks.' The theory is combated by Mr. Wallace in his *Tropical Nature* (1878).

Seychelles' Cocoa-Nut, or Double Cocoa-Nut (*Lodoïcia Seychellarum*), is a remarkable palm found only on two or three small rocky islands of the Seychelles group. The fruit takes several years to come to maturity, when it attains a gigantic size, weighing often 40 to 50 lbs., and consists of a thick fibrous rind enclosing one or more nuts divided half-way down into two lobes. The unripe fruit is eaten, and the hard black shell of the nut is carved into ornaments and Fakirs' drinking-cups. The leaves when young yield a beautiful material for basket and plaited work; hats, fans, &c., are made from them; when full grown they are used for partitions and roofs of houses. See PALMS.

Seychelles' Islands, an archipelago of about 30 small islands belonging to Great Britain, situated in the Indian Ocean between 30° 40'—5° 35' S. lat., and 55° 15'—56° E. long. The largest island is Mahé, which has an area of 60 sq. miles, and on it is Port Victoria, the principal settlement. The islands are girt by coral reefs, but are of granitic formation and mountainous, reaching a height of 3000 feet in Mahé, and 2500 feet in the smaller island of Silhouette. Flat, sandy beaches, studded with lagoons, intervene between the mountains and the sea. The climate is healthy, and hurricanes are rare. In some of the islands the soil has been almost entirely washed away by the rains, but as a rule they are fertile, and are capable of yielding large crops of all kinds of tropical produce. Cocoa-nut oil and fibre are the chief products, but cloves, vanilla, coffee, cotton, and tobacco are also exported. The cultivation of the sugar-cane has ceased of late years. In 1875 the total value of the imports was £32,373, and of the exports, £28,934. The French were the first to settle the S. I. in 1756, but in 1778 they destroyed all the spice-bearing plants to prevent them from falling into the hands of the British, who, however, took possession of the group in 1794. In 1815 it was ceded to Britain along with Mauritius, of which island it now forms a dependency. Pop. (1871) 11,082. See *Account of the Seychelles*, by Sir Edward Belcher; *Report on the Seychelles*, by J. Horne (1875).

Seymour, The House of, derives its surname from St. Maur in Normandy, and in the 13th c. became possessed of Penhow, Woundy, &c., in the county of Monmouth. A Sir John S. helped to suppress the rising of Lord Audley and the Cornish rebels (1497), for service in the French wars was created a knight-banneret (1513), and dying January 21, 1536, left six children. Of these Jane, third wife of Henry VIII. and mother of Edward VI., died October 23, 1537, and Thomas, Lord S. of Sudeley, Lord-Admiral of England, and second husband of Queen Catherine Parr, was brought to the block (March 20, 1549) by his eldest brother Edward. The latter, raised to the peerage as Viscount Beauchamp (1536), and created Earl of Hertford (1537), was appointed by Henry VIII. one of his executors and head of the Council of Regency to Edward VI. (q. v.), but by that council was straightway chosen Protector, with the title of Duke of Somerset, February 16, 1547. He carried on the sweeping religious changes of Cromwell, defeated the Scots

at Pinkie, but by his brother's execution alienated the populace, and by popular concessions the nobility, so that he fell an easy prey to Northumberland (q. v.), being sent to the Tower (October 1549), temporarily released, but again arrested and beheaded, January 22, 1552. Elizabeth in 1558 restored the titles Baron Beauchamp and Earl of Hertford to his eldest son by a second marriage, Edward S., who fell, however, into great disfavour with the queen through his union with Catherine, Lady Jane Grey's sister, and lay for nine years in the Tower. So, too, his grandson, Sir William S., awoke the jealousy of James I. by seeking to wed the Lady Arabella Stuart, and had to flee the country; but having played a gallant part in the Great Rebellion, he obtained a reversal of his ancestor's attainder, and on 13th September 1660 became second Duke of Somerset, only to die in five weeks' time. Charles, the fifth duke, commonly known as the 'Proud Duke of Somerset,' married the heiress of the house of Percy (q. v.), and died in 1748, having held high offices in the courts of Charles II., William III., and Anne; and his sole surviving son Algernon dying in 1750 without male issue, the dukedom reverted to Sir Edward S., eldest descendant of the Protector Somerset by his first marriage. Sir Edward's great-grandson, Edward Adolphus (born September 20, 1804), the twelfth and present duke, inherited the title in 1855, and having no male issue living, will be succeeded by his brother Archibald-Henry-Algernon (b. December 30, 1810), or failing him by his second brother Algernon-Percy (b. December 22, 1813).

Seymour, Hora'tio, an American politician, born at Pompey, Onondaga county, New York, May 31st, 1810. He was admitted to the bar in 1832, and in 1841 began his political career as a member of the State Assembly on the Democratic side. He was elected Governor of the State in 1853, and in 1854 vetoed a prohibitory liquor law, on which account he lost the Governorship in 1855, but was re-elected in 1862. In 1868 he was nominated for the Presidency, but was defeated, and has not since taken much part in politics.

Seyne, La, a town of France, department of Var, on the Mediterranean, 3 miles S.W. of Toulon. It has a large harbour and handsome wharves. Pop. (1876) 8152.

Sforza, the name of a powerful Italian family of the 15th and 16th centuries, which sprang from Giacomuzzo Attendolo, a peasant of the Romagna (born June 10, 1369), who as a *Condottiere* gained the surname S. ('the vanquisher,' lit. 'the forcer'), and played a prominent part in Naples under Joanna II., gaining great possessions, and becoming Grand Constable of Naples. He was drowned in the river Pescara, January 4, 1424.—His natural son, **Francesco Alessandro S.**, born at San Miniato, July 23, 1401, inherited the command of his father's mercenaries, and served as a *Condottiere* in several states, especially Venice and Milan. He married Bianca, illegitimate daughter of Filippo Maria Visconti, and after the death of the latter (1447) seized (1450) the duchy of Milan, which he ruled with prudence till his death (March 4, 1466). See P. Urquhart, *Life and Times of Francesco S.* (2 vols. Edin. 1852).—His cruel and dissolute son and successor, **Galeazzo Maria S.** (born at Fermo, January 14, 1444), was slain by conspirators, December 26, 1476.—**Giovanni Galeazzo Maria S.** (born in 1458), son and successor of the latter, was driven from the throne and probably poisoned (1494) by his father's brother, **Lodovico Maria S.**, surnamed **Il Moro** ('the Moor'), who, to confirm his usurpation, induced Charles VIII. of France to attack Naples (1494), to which the French house of Anjou laid claim. Soon foreseeing this policy fatal to his family, he joined (1495) the league against France, and was deposed (1499) by Louis XII., who claimed his lands as a descendant of a legitimate daughter of the Visconti family. In 1500 Lodovico returned with an army of Swiss, who betrayed him to the French, by whom he was kept in confinement till his death at Loches in Touraine, May 17, 1508.—His son, **Massimiliano S.** (born 1491), with the help of Swiss soldiers, gained possession of Milan in 1512, but after a defeat at Marignano (1515) was forced to resign it to François I., receiving a yearly pension. He died at Paris in June 1530.—**Francesco Maria S.** (born in 1492), brother of the preceding, became Duke of Milan in 1524, and in 1529 was acknowledged as such by the Emperor Karl V. The last of his line, he died at Milan, 24th October 1535, and Karl V. took possession of Milan as a lapsed

See Ratti, *Memorie della Famiglia S.* (2 vols., Rome, 1794-95), and Sismondi, *Histoire des Républiques Italiennes du Moyen-Age* (10 vols., Par. 1840).

Sforza'to (Ital. 'forced') in music. When a note is to be placed with greater emphasis than others, the sign *sf.* is placed above or below it.

Sgraffi'to (Ital. 'scratched'), a species of ornamentation in plaster wherein a design is scratched with a bodkin through a thin white coat, exposing a dark-coloured substratum, which serves as a shadow. After being used as a means of decorating pottery, S. was employed for mural decoration and carried to great perfection in Italy in 15th and 16th centuries. Old examples of it exist at Padua, Mantua, Pisa, and many other Italian towns. S. has been revived of late years in Italy, Germany, and England for the decoration of buildings. At the South Kensington Museum in London the method pursued is as follows:—On a rendered surface of Portland cement a coat of dark-red plaster $\frac{1}{2}$ inch thick is laid, and while still moist it is covered with a thin layer of light-coloured plaster 'floated' on evenly. The intended design is then traced with a style on the wet plaster, which is cut accordingly with a knife.

Shabb'athai Zewi, a Jew, born at Smyrna, 1641, was a convert to the fantasies of Isaac Luria, a great student of the Cabbala, who declared that he held intercourse with the prophet Elijah, and that he was the Messiah, the son of Joseph. The notion of two Messiahs occurs in the Talmud: a 'son of David,' and a 'son of Joseph,' the latter being the forerunner of the former, and destined to suffer death in the struggle with the enemies of the kingdom of God. S. Z. himself came forward first as a prophet, and then gave himself out for the Messiah, and, notwithstanding that he was repudiated by the Rabbis, gained a large number of followers among his co-religionists. Although S. Z. was converted to Mohammedanism (1667), the sect survived, and still acknowledged him as the Messiah. This they were enabled to do by justifying his apostasy, which they did on the ground that 'the form of religion which he proclaimed stood as far above Judaism as it did above Christianity and Mohammedanism, was destined to absorb all the three, and consequently was indifferent to each one's particular usages.' One of the principal tenets of the sect was that the Talmud was full of errors and promoted immorality. From the great veneration they paid to the Cabbala, and especially the book Zohar, they received the name of Cabbalists or Zoharites. They acknowledged a Trinity in the Godhead, regarding Adam as an incarnation of the divine nature and the second Person, and their Messiah as the third. There are said to be some remnants of the sect still lingering in Poland and Turkey. See Franck, *La Kabbale* (Par. 1843), and Worman's *Historic Studies*, in Dickinson's *Homiletic Monthly*, July and August 1878.

Shad (*Alosa*), a genus of *Teleostean* fishes, belonging to the Herring family (*Clupeide*). It is found in the river-estuaries of Britain, France, and other parts of Europe, as well as of America and Canada. The common or Aliche S. (*Alosa vulgaris*), and Twaite S. (*A. furla*), are the two best-known species. The S. inhabits the sea, but haunts the estuaries of rivers, which it ascends for the purpose of spawning in spring. It resembles the herring in shape. The common S. may measure even 2 feet in length, and is named in Scotland the 'Herring King'; it is more abundant in the Severn than in any British river. The Twaite S., common in the Thames, attains a length of from 12 to 15 inches, and may not be captured after June in the Thames.

Shadd'ock (*Citrus decumana*) is a tree of 12 to 18 feet high, with large, wing-stalked leaves, a native of China, whence it was introduced by Captain Shaddock into the W. Indies. It is also grown in the orange districts of S. Europe. The fruit is of a handsome light-yellow colour; the rind thick, white, and spongy within, and very bitter; the pulp watery and sub-acid. S. is brought to table more as an ornament than for use, but both pulp and rind are made into preserves. In certain varieties the fruit sometimes attains a weight of 20 lbs. These large fruits are known as Pompelmooses (q. v.), and the small kinds are the Forbidden Fruit (q. v.) of the fruit market.

Shad'ow of a body is the portion of space from which that body cuts off the light of a luminous source. If the luminous source were a mere point, the S. would be sharply defined.

Practically, however, this is impossible. Our luminous sources are usually of definite dimensions, and since each point of the source casts a S. of the body, the S. which is really seen is made up of a numerous number of shadows. Where these component shadows overlap, the compound S. is darkest, while towards its borders it passes by insensible gradations from this darkest tint to light. The central portion of such a S. is called the *umbra*, the lighter portion the *penumbra*.

Shadwell, Thomas, an English dramatist, belonged to a good Staffordshire family, and was born at Stanton Hall, Norfolk, in 1640. Educated at Caius College, Cambridge, he studied law in the Middle Temple, and after some foreign travel, settled in London as an author. His first effort for the stage was a tragedy, entitled *The Royal Shepherdess* (1669). Of his subsequent productions, the chief are the comedies of *The Sullen Lovers* and *The Humourists* (1669-70), *The Miser* (1671) from Molière, the tragedies of *Psyche* (1675) and *The Libertine* (1676), and the comedies of *Epsom Wells* (1678), *The Lancashire Witches* (1682), *Bury Fair* (1689), and *The Scourers* (1690). S. became Poet Laureate in 1688, and died November 19, 1692. He was a reckless, inartistic, licentious writer, whose talent never found adequate expression through his pen. 'His plays,' says Robert Bell, 'sealed up by their indecencies from the present generation, exhibit fertility of invention and considerable capacity of observation.' The Earl of Rochester said of S.: 'If he had burnt all he wrote and printed all he spoke, he would have had more wit and humour than any other poet.' Unhappily for his memory, he provoked the enmity of Dryden, who in his *Mac Flecknoe* has inflicted on S. everlasting punishment.

Shafarik, Paul Joseph, a great Slavic philologist, born 13th May 1795 at Kobelyarovo in N. Hungary, was educated at Kásmark Lyceum (1810-15) and the University of Jena (1815-17). In 1819 he was appointed director and professor of *Humaniora* at the Serbian gymnasium at Neusatz. He resigned the directorship in 1825, holding the other post till 1833, when he removed to Prag. Here in 1848 he became librarian of the Public and University Libraries. He died at Vienna, 26th June 1861. His chief works are *Geschichte der Slav. Sprache und Literatur nach allen Mundarten* (Ofen 1826); *Ueber die Abkunft der Sklaven* (1828); *Serb. Lesekörner* (Pest. 1833); *Slovanské Starozitnosti* (Prag 1837; Ger. trans. 2 vols. Leip. 1842-44); *Die ältesten Denkmäler der böhmischen Sprache* (1840); *Slovanský Narodopis* (1842); 3d ed. 1850; *Denkmäler der glagolitischen Literatur* (1853); *Glagolitische Fragmente* (1856); *Ueber Ursprung und Heimat des Glagolitismus* (1858).

Shaftesbury, a decayed market town of Dorsetshire, England, stands on a hill, 22 miles W.S.W. of Salisbury, and 3 S.W. of Semley station. Out of twelve churches but three remain—St. Peter's, a Norman structure; Holy Trinity (rebuilt 1842); and St. James' (rebuilt 1867), other buildings being the town-hall, market-house (270 feet in length), literary institute (1852), the Westminster Schools (1871), and Westminster Cottage Hospital (1874). Glovemaking, the chief industry, employed 156 women in 1871. S. returns one member to Parliament, and publishes one weekly newspaper. Pop. (1871) 2472. At S. (the *Caer Palladur* of the Britons) Eadward the Martyr was buried (979), and here Cnut died (1035).

Shaftesbury, Anthony Ashley Cooper, First Earl of, was born at Wimborne St. Giles, in Dorsetshire, 22d July 1621, and left an orphan by the death of the knight his father (1620), himself defended his property from an uncle's greed. In his seventeenth year he went up to Exeter College, Oxford; in his eighteenth married; and in his nineteenth sat for Tewkesbury in the Short Parliament. When the Civil War broke out he was with the king at Nottingham, 'as a spectator, not having as yet adhered to the Parliament;' but in 1643 he accepted the governorship of Weymouth, and raised a regiment for the royal service. Presently, 'following the dictates of a good conscience' (i.e., foreseeing the king's defeat), he took himself over to the Parliament, fought for it valiantly in the south-western counties till the Self-Denying Ordinance cut short his career of arms (1654), and after some quiet years of country life became a Parliamentary Commissioner (1652), a Wiltshire member in Barebones Parliament (1653), and one of the thirty composing Cromwell's council. From pique or policy he broke with the Protector (1655), reviled his memory in Richard's Parlia-

ment, and next to Monk was the chief promoter of the Restoration. As Baron Ashley and Chancellor of the Exchequer (1661) he made the court the field of his ambition, toleration his passport to popularity; and, Clarendon's intolerance got rid of (1667), he leagued himself with Catholic Clifford and Arlington in the Cabal. The Deist champion of the Presbyterians, the temperate sharer in his king's debaucheries, the clean-handed judge who sat in judgment on regicides, his old allies, and winked at the closing of the Exchequer, at last he purchased toleration by consenting to war with Holland (1670), and for this same consent was made Lord Chancellor and Earl of S. (1672). From Arlington he learnt how the Treaty of Dover contained a secret clause, known but to two in the Cabal, by which Charles bound himself to re-establish Popery, Louis to back him with men and subsidies; and the change in his policy was swift and absolute—from Declarations of Indulgence to Test Acts, from war with Holland to intrigues with the Prince of Orange, from a seat in the Cabal to the leadership of the 'Country Party.' Deprived of the Seals in 1673, he worked the cries 'No Popery' and 'Liberty,' successfully opposed the passive-obedience principles of Danby's Bill (1676), but for his daring protest against a pro-rogation of fifteen months endured a year's imprisonment in the Tower (1677-78). The frenzy of the Popish Plot brought S. back to power; as President of the Council (1679) he carried the Habeas Corpus Act, and in the Lower House a bill excluding James; but by the recognition of Monmouth's pretensions divided his party and earned his own dismissal. The 'Meal-Tub Plot' was swamped by a reaction, 'abhorers' outnumbered the 'petitioners,' the Duke's presentment as a recusant miscarried, as also did the desperate Divorce Bill, and on 2d July 1681 S. was again committed to the Tower. A Middlesex grand-jury ignored his bill of indictment; but hopelessly committed against the Court, and failing to rouse his 'City boys' to insurrection, he fled disguised to Amsterdam, where, two months later, the 'fiery spirit' quitted the 'puny body fretted to decay,' 21st January 1683. All know the 'Achitophel' of Dryden's satire, the 'abhorred statesman' of whom Macaulay says that 'every part of his life reflected infamy on the other;' let them remember also that this was he whom Locke esteemed and loved, whom even Dryden acknowledged incorruptible, whose perfect charity Lady Russell bore witness to—'the great faulty human being in whom the faults are indissolubly blended with the greatness,' and to whose Habeas Corpus we owe the keystone of our liberties. See his *Life*, with its fragment of *Autobiography*, by W. D. Christie (2 vols. Lond. and New York, 1871).—**Anthony Ashley Cooper, Third Earl of S.**, and grandson of the above, was born in London, 26th February 1671, and sent to Winchester at the age of twelve. Having made the grand tour (1686-89), he sat for Poole in Parliament (1694-98), succeeded his father in the title (1699), and in the Upper House was a staunch adherent of William III. On Anne's accession he withdrew from politics, and visiting Italy in search of health, died at Naples, 15th February 1713. The 'moral realist,' who like most prophets has had least renown in his own country, was author of an *Inquiry Concerning Virtue* (1699), *Letter on Enthusiasm* (1708), *Moralists*; a *Philosophical Rhapsody* (1709), *Essay upon the Freedom of Wit and Humour* (1709), and *Advice to an Author* (1710), all but the first collected in *Characteristics of Men, Manners, Opinions, and Times* (3 vols. 1711; ed. by the Rev. W. M. Hatch, vol. i. Lond. 1870). In an elaborate and tedious style he here maintains that everything is for the best, that ridicule is the touchstone of truth, and that man possesses a 'moral sense,' though whence derived he does not profess to ask. See Gizycki's *Philosophie S.'s* (Leip. 1876).—**Anthony Ashley Cooper, Seventh Earl of S.**, 28th April, 1801, and passed from Harrow to Christ Church College, Oxford. He took a first class in classics (1822), and four years later entered Parliament as a Tory, sitting for Woodstock (1826-30), for Dorsetshire (1831-46), and for Bath as a Liberal Conservative (1847-51). Under Wellington he was Commissioner of the Board of Control (1828-30), under Peel a Lord of the Admiralty (1834-35) and an Ecclesiastical Commissioner (1841-47). He succeeded to the earldom (1851), and since 1856 has been Lord-Lieutenant of Dorsetshire. His honours fade, however, before the honour of having spent his talents—rank, wealth, and eloquence—on bettering the condition of the poor. In the teeth of strong opposition he carried the Ten Hours' Bill for shortening the daily toil of children in mines and factories,

at the cost of a seat supported Peel in his free-trade policy, and with voice, and pen, and purse has forwarded a hundred educational and philanthropic schemes. An Evangelical, he is President of the Bible Society, the Pastoral Aid Society, and that for the Conversion of the Jews; and to him was ascribed the exclusive creation of Low-Church bishops during the premiership of Palmerston, his connexion by his marriage (1830) with Earl Cowper's daughter. She died 15th October 1872, having borne him four daughters and six sons, the eldest of whom, Anthony Lord Ashley (born 27th June 1831), has issue.

Shag. See CORMORANT.

Shagreen (Fr. *chagrin*; Turk. *sagri*, the crupper skin of a mule or ass), a kind of parchment covered with raised granulations prepared in the East from the skins of horses and wild asses. It comes chiefly from Astrakhan. A strip of skin from the neck to the crupper only is used, and after being steeped cleaned, and scraped, the small seeds of a species of *chenopodium* are embedded by pressure into the grain side of the soft skin. When the skin is dry the seeds are shaken off, and the pits or depressions left by them are almost obliterated by shaving the skin. It is then placed in boiling water, which swells the former depressions, and causes them to rise above the surface. After steeping in lye, the skin is dyed, green being a prevailing colour. S. was formerly much used for covering spectacle, fan, and bijouterie cases.

Shah (Pers. 'king'), the abbreviation of the full title *S.-in-S.* ('king of kings') of the sovereigns of Persia and Afghanistan. The title of a king's son is *Shahzada*.

Shahabad, a district in Bengal, British India, which lies S. of the Ganges and borders on the N.W. Provinces. Area, 4385 sq. miles; pop. (1872) 1,723,974. Away from the river forest-clad hills rise abruptly to the plateau of Central India. The inhabitants are largely Rajputs, who formerly enlisted in the Bengal native army and rose against the British in 1857. Arrah, the chief town of the district, was the scene of an heroic defence and final relief by Major Vincent Eyre. The stronghold of the Rajput ringleader at Jugdespore was razed to the ground. Other places are Sasseram and the hill fort of Rohtasguri. In S. district are the head-works of the Sone Canal (q. v.). In 1876-77 the registered exports, chiefly sugar, indigo, food-grains, and oil-seeds, were valued at £329,000; the imports, which included cotton goods and salt, at £414,000. The district is traversed throughout its entire length by the E. Indian Railway.

Shah Alum ('king of the universe'), the last of the Mogul emperors of Delhi who exercised even a nominal independence, reigned from 1759 to 1806. For twelve years he was an exile, chiefly at Allahabad, where on 12th August 1765 he granted to the E. India Company the Dewanny of Bengal, Behar, and Orissa. In 1771 he put himself under the power of the Mahrattas, but in 1788 a Mahomedan rebel, Gulam Kadir, seized Delhi and with his own dagger struck out the emperor's eyes. The Mahratta chief Scindiah avenged this crime; and Lord Lake in 1803, after defeating the Mahrattas outside Delhi, placed S. A. in a position of comparative affluence during the three last years of his long and miserable life.

Shah Jehan ('king of the world'), the fifth Mogul emperor of Delhi, was the son of Jehangir and father of Aurangzib, reigned from 1628-58. Though the third son, he was at first his father's favourite. He led the army which finally crushed the Rajputs in 1614, but afterwards rebelled against Jehangir, and maintained himself for a time in independence in Bengal. On his father's death in 1628, he established himself on the throne by putting to death all of the line of Baber, except his own children. The Mogul Empire now reached its zenith. The Deccan was subdued, and also the Mahomedan kingdom of Golconda; Afghanistan was for a time in his possession, and neither the Mahratta nor Sikh power had yet arisen. The Portuguese were exterminated at Hooghly. The Mogul architecture was also at its height. Delhi was rebuilt, and renamed Jehanabad; the peacock throne worth £6,500,000 sterling was constructed; and the world-renowned Taj Mehal was erected at Agra as the mausoleum of the empress, Mumtaz Mehal. But the unfilial conduct of S.-J. was revenged upon

himself. His third son Aurangzib had determined to be his successor. Taking advantage of a sudden illness of his father, he defeated his three brothers and threw S.-J. into prison at Agra (1658), where he died in December 1666. He left a treasure of £24,000,000 in coin, besides wrought gold and silver, and jewels.

Shahjahanpore, the chief town of the district of the same name, in the N.W. Provinces, British India, on the Gurrar river, a tributary of the Ganges, 102 miles N.W. of Lucknow by rail, and 43 S.E. of Bareilly. It is a large town, with considerable trade, and contains several stately old mosques and a fort. In 1857, the sepoy regiment stationed here mutinied. The gaoi was opened, and the treasury plundered; some of the Europeans were killed, and the rest escaped to be destroyed yet more miserably at Mohumdee, in Oudh. Pop. (1872) 72,136.—The district of S., which lies between the foot of the Himalayas and the Ganges, has an area of 1723 sq. miles; pop. (1872) 949,579. The crops are rice, maize, wheat, cotton, and sugar-cane. This tract was formerly part of Rohilkund, and was ceded to the British in 1801.

Shake (*trillo*, Ital.), a musical embellishment consisting of the rapid alternation *ad libitum* of two notes, a tone or a semitone apart. It is an effective device much used by instrumental and vocal soloists, chiefly towards the close of a theme. The S. often begins slowly, increasing in rapidity as it proceeds, thus—
When preceded by an appoggiatura it usually ends with a turn. A succession of shakes is called a chain (*catena*).

Shakers, (1) the popular name of the oldest communistic religious sect in America, which formally designates itself 'the Millennial Church or United Society of Believers, commonly called S.' Its founder, Ann Lee, a blacksmith's daughter, was born at Manchester, England, 29th February 1736. A religious agitation having broken out in the Quaker body to which Ann belonged, she placed herself at the head of the movement, with pretensions to divine authority. Being imprisoned in 1773 for obstructing the thoroughfare, she received a vision telling her to go to America, whither she sailed with eight followers in 1774, settling at Watervliet, 7 miles N.W. of Albany, in 1775. She gained few converts till 1780, when she reaped a rich crop during a revival among the Baptists. Her death occurred at Watervliet, 8th September 1784, and she was succeeded by Elder James Whittaker, under whose régime the first chapel was built (1785). In 1792 the first society of S. was constituted at New Lebanon. The sect spread with some rapidity, and by 1830 comprised eighteen societies, distributed over seven states. No new societies have been founded since 1830, though their membership has been pretty well maintained. In 1874, 18 societies comprised 58 families or separate communities containing 695 adult males, 1189 adult females, 192 boys, and 339 girls, in all 2418 souls. Their farms amounted to 49,335 acres, and as much more land owned by them was let to the 'Gentiles.'

The chief doctrines of the S. creed are:—I. God is a dual person. II. Christ is a spirit. Jesus represents his male, Ann Lee his female element. III. The religious history of man is divided into four cycles, the last commencing with Ann Lee. IV. The Society is the true church of the last dispensation. V. Its members have the five great principles of the Pentecostal Church—viz., community of goods, a life of celibacy, non-resistance, separate government, and power over physical disease. VI. They reject the Trinity, the resurrection of the body, and the Atonement. VII. They are spiritualists. The S. are chiefly engaged in agriculture; their homes are spotlessly clean, though they will not admit anything beautiful. Men and women are on a footing of absolute equality; every one is compelled to share in some manual labour. The strictest celibacy is maintained. The sexes occupy different parts of the houses, and at the meals, which are taken in silence, sit on opposite sides of the table. Their religious service consists largely of singing some of their grotesque hymns, and of the peculiar shuffling dance which

gained for them their name. They are governed by elders and ministers who appoint their own successors. They are divided into two orders—a church order and a novitiate order, which newcomers must pass through.

The S. draw their converts from all classes—clergymen, lawyers, doctors, farmers, students, mechanics, sea-captains, soldiers, and merchants, but most largely from clergymen of the Baptist, Methodist, Presbyterian, and Adventist persuasions. Revivals are their chief sources of recruitment. Fred. W. Evans (Brother Frederick) calls them 'the hotbeds of Shakerism.' The S. have many quaint customs. They do not shake hands, wear a plain dress, 'have no scandal, no tea-parties, no gossip.' A monthly magazine is issued called *Shaker and Shakeress*. See *The Kentucky Revival*, &c., by M'Nemar, Turtle Hill, Ohio (1807), *Testimony of Christ's Second Appearing*, Albany (1856), *S.'s Compendium of the Origin, History, &c., with Biographies of Ann Lee, &c.*, by F. W. Evans (1859), *Selection of Hymns and Poems for the Use of Believers*, Watervliet, Ohio (1833), *New America*, by Hepworth Dixon (Lond. 1867), and a very complete and interesting account in *The Communistic Societies of the United States*, by Charles Nordoff (Lond. 1875).—(2) S. is also the popular name of a small Society calling themselves Bible Christians, founded in 1869 by Mrs. Girling, wife of a farmer in Suffolk, England. She started a 'family' in London in 1871, on the basis of celibacy and community of goods, and in eighteen months moved to New Forest Lodge, near Lymington; but the only wealthy member having been transferred to a lunatic asylum, the 'family' got into debt and were ejected, 15th December 1874. After this they lived in a barn, and then in a field till August 1878, when they were again ejected. They indulge much in dancing, and live huddled together in a hovel. Their numbers have fallen from 130 to 80, including 38 women, 23 men, and 19 children.

Shakespeare, William, was born at Stratford-upon-Avon in the year 1564. It has been the fashion to quote the saying of George Steevens, that all we know of his life is that he married and had children in Stratford, 'went to London, where he commenced actor, and wrote poems and plays; returned to Stratford, made his will, died, and was buried.' This famous dictum represented unfairly even the knowledge which had been acquired in the end of last century, when Steevens wrote. Within the present century it has been entirely falsified by the labours of a host of scholars and antiquaries, who have provided us with a solid framework of unquestionable facts on which to arrange our conceptions of the most important life in the history of culture. In many cases, too, the facts afford a touchstone, enabling us confidently to accept or reject the traditions which at one time formed the staple matter of Shakespearian biography.

Facts.—The Shakespeares were an old Warwickshire family of the middle class. Dr. Ingleby enumerates nearly 70 different ways in which the name is spelt in legal and other documents. The poet himself, in four out of the six signatures which we possess, spells it 'Shaksperc,' while the remaining two are doubtful; but his contemporaries so invariably adopt the longer spelling that it has as a rule been preferred, the more so as he himself sanctions it by permitting it to stand upon the title-pages of the only two of his works (*Venus and Adonis* and *Lucrèce*) which are known to have been published under his own supervision. John S., the poet's father, was almost certainly the son of a Richard S., who resided at Snitterfield, a village near Stratford, where he rented some land from Robert Arden or Ardern, a yeoman of Willmecote, whose daughter, Mary, John S. afterwards married. The Ardens had been prosperous yeomen in the parish of Aston Cantlow since 1438. Robert Arden died in 1556, leaving to his daughter Mary a portion of his land, including the farm of Asbyes, and the reversion of a considerably more valuable property. Probably in the next year Mary married John S., who had settled in Henley Street, Stratford, as early as 1552. In 1556 he acquired copyhold property in Greenhill Street and Henley Street, and in the same year he is mentioned in a legal document as a *glover*. His daughter Jone was baptized September 15, 1558, and on December 2, 1562, his daughter Margaret, who died in the next year. In these years John S. had passed through various grades of municipal dignity, being successively ale-taster, one of the four constables, and one of the four 'affeerors,' appointed to determine fines for offences punished arbitrarily. On the 26th of April 1564 his son WILLIAM was baptized. Next year

(1565) John S. became an Alderman, and in 1568-69 he attained the summit of municipal distinction in Stratford, becoming High Bailiff. In 1571-72 he was Chief Alderman, and in 1575 he purchased the Henley Street property. From this point his fortunes seem to have gone down hill. From 1577 to 1586 his attendance at the corporation meetings was very irregular, and in the latter year he was deprived of his alderman's gown. In a document of 1579 he is described as a *yoman*. The following are the dates of the births of his remaining children as gathered from the register of baptism:—Gilbert 1566; a second daughter, Jane, in 1569 (the death of the first Jane is not recorded); Anna 1571 (died 1579); Richard 1573 (died 1612); Edmund 1580. In 1578 John S. mortgages for £40 his wife's farm of Asbyes, and in this and the next year he appears as unable to pay certain minor municipal taxes. He is returned in 1586 as having nothing upon which a writ of *distingas* can be executed, and three writs of personal seizure are issued against him. In the next year he produces a writ of *habeas corpus*, thus proving that he had been imprisoned. Even so late as 1592 he appears in a list of nine persons who 'coom not to church for feare of processe for debtt.' After this date, however, as we shall see, incidentally, his circumstances seem to have improved again, probably through the assistance of his son William.

The first absolutely authentic event in the life of William S. is his marriage with Anne Hathaway, daughter of Richard Hathaway, a substantial yeoman of Shottery, near Stratford, and a family friend of the Shakespeares. The marriage bond is still extant, dated November 28, 1582, at which date S. was only eighteen, while his wife was nearly eight years older. Their daughter Susanna was baptized on the 26th May 1583, and their twin children Hamnet and Judith on the 2d February 1585. Then occurs a hiatus of no less than seven years, during which no indubitable reference to S. can be found. The certificate of 1589 in the Ellesmere papers, in which he appears as a sharer in the Blackfriars Theatre, London, is now regarded as a fabrication, and it is only by the most ingenious manipulation of facts, dates, and probabilities that Spenser's line in the 'Teares of the Muses' (1591), 'Our pleasant Willy, ah! is dead, of late,' can be taken as referring to S. In 1592, however, we find an unquestionable allusion which exhibits S. as a dramatist in London well enough known to be hated and envied. Robert Greene the dramatist died on the 3d September 1592, and immediately after his death his friend Henry Chettle published his 'Groatworth of Wit bought with a Million of Repentance,' in which Greene speaks of a rival playwright as 'an upstart crow beautified with our feathers, that with his *Tygres heart, wrapt in a player's hyde*, supposes hee is as well able to bombast out a blank verse as the best of you; and being an absolute *Johannes fac totum*, is, in his owne conceyt, the onely Shake-scene in a countrey.' That this diatribe alludes to S. it would be absurd to doubt; nor is the application dubious of the passage in Chettle's 'Kind-Hart's Dreame,' published a few months afterwards, in which he apologises for his friend's virulence against his rival 'because myselfe have seene his demeanor no lesse civill than he exelent in the qualitie he professes: besides, divers of worship have reported his uprightness of dealing, which argues his honesty, and his facetious grace in writting, which approoves his art.' In 1593 *Venus and Adonis* was published, with a dedication to Henry Wriothesley, Earl of Southampton, in which it is described by S. as 'the first heir of his invention.' In 1594 appeared *The Contention of York and Lancaster* (now 2 *Henry VI.*), as well as *Lucrece*, which also was dedicated to Southampton, and was in the same year alluded to with praise by Drayton in his 'Matilda,' and by an anonymous poet in a book called 'Willobie his Avis.' In 1595 *The True Tragedy of Richard, Duke of York* (now 3 *Henry VI.*) was published. *Lucrece* is praised in a book called 'Polimanteia' of this year, in which, too, was published Spenser's 'Colin Clout's come Home Again,' containing a verse which may possibly allude to S. Two interesting documents in which S.'s name occurs are dated 1596, but unfortunately both are now looked upon as spurious. On August 11, 1596, Hamnet, his only son, was buried at Stratford. In this year, too, John S., the poet's father, applied to the Herald's College for a grant of arms, which was conceded in the following year. In 1597 were published a pirated copy of *Romeo and Juliet*, as well as *Richard II.* and *Richard III.*; and in this year S. bought New Place, one of the best houses in Stratford, of William Underhill, for £60; while we also find John S. and his wife engaging in a Chancery suit ancient the mort-

gage on the farm of Asbyes. The year 1598 is peculiarly rich in facts and allusions. 1 *Henry IV.* and *Love's Labour's Lost* (the first play with S.'s name attached) were published. S. is mentioned in a Stratford return of grain and malt as holding 10 quarters: he sells a load of stone to the Stratford corporation for 10d.: he is assessed 13s. 4d. on property of £5 value in the parish of St. Helen's, Bishopsgate. A letter is extant, dated January, in which Abraham Sturley of Stratford recommends a correspondent in London to encourage S. to buy some land at Shottery; and in another letter, dated November, the same Sturley again alludes to S. On October 25th Richard Quiney, whose son Thomas afterwards married Judith S., wrote to S. requesting a loan of £30. He is known to have been one of the principal actors in Ben Jonson's 'Every Man in his Humour,' produced at the Globe in this year. But 1598 is above all notable as the date of publication of Francis Meres' 'Palladis Tamia' ('Wits Treasury'), in which the author alludes in terms of euphuistic eulogy to 'mellifluous and honey-tongued S.,' mentioning 'his *Venus and Adonis*, his *Lucrece*, his *Sugred Sonnets* among his private friends,' as well as 'his *Gentlemen of Verona*, his *Errors*, his *Love Labours Lost*, his *Love Labours Wonnes* [which has been by different critics identified with *The Taming of the Shrew*, *All's Well that Ends Well*, and *Much Ado*], his *Midsummer Night's Dreame*, his *Merchant of Venice*,' and 'Richard II., Richard III., Henry IV., King John, Titus Andronicus, and his *Romeo and Juliet*.' In this year, too, were published Richard Barnefield's 'Poems in Divers Humours,' containing a eulogium of S. *The Passionate Pilgrim* (with S.'s name, but only partly his) and a perfect *Romeo and Juliet* were published in 1599, to which year also belongs the publication of Weever's 'Epigrams,' with a laudatory allusion to S. In 1600 were published 2 *Henry IV.*, two editions of the *Midsummer Night's Dreame*, two editions of the *Merchant of Venice*, *Much Ado About Nothing*, *Titus Andronicus*, and an imperfect copy of *Henry V.*, S.'s name being attached to all but the last two. Extracts from S. occur in two poetical anthologies published in this year. The poet's father died at Stratford in 1601. In 1602 an imperfect *Merry Wives of Windsor* was published, and *Othello* was acted before Queen Elizabeth. S. made large purchases of property in this year, buying 107 acres of arable land in the parish of Old Stratford for £320, a cottage in Dead Lane near New Place, and other land and house property to the value of £60. An imperfect *Hamlet* was published in 1603, and two allusions are made to S. in contemporary verse, one of them by Chettle, chiding him for not having written an elegy on Queen Elizabeth. On May 7th a warrant was issued constituting the former Lord Chamberlain's players, S. being one of them, 'the King's players.' In this year he took a leading part in Jonson's 'Sejanus.' *Hamlet* in its perfect form was published in 1604, and in the same year S. brought an action against Philip Rogers in the court of Stratford for £1, 15s. 10d. due to him for malt. S.'s largest pecuniary transaction of which we have record occurred in 1605, when he paid £440 for the unexpired term of a moiety of a lease of the tithes of Stratford, Old Stratford, Bishopston, and Welcombe, granted in 1544 for ninety-two years. It is inferred from a document of 1606 that S. was not at that date resident in Stratford. In the next year (1607) his eldest daughter, Susanna, married Mr. John Hall, a physician of Stratford, and his youngest brother, Edmund, an actor in London, died. To this year belongs the eulogium addressed to S. by John Davies in his 'Scourge of Folly.' Two editions of *King Lear* were published in 1608, in which year S.'s mother died at Stratford. Two more or less apocryphal documents in the Ellesmere collection bear this date, the one purporting to be a letter of the Earl of Southampton showing that S. had left the stage, the other a valuation of the Blackfriars Theatre, in which his property in the building and wardrobe is stated at £1433, 6s. 8d. In 1609 were published the *Sonnets*, *Pericles*, and two editions of *Troilus and Cressida* (bearing S.'s name, as do all the plays mentioned since 1600). In this year S. sues at Stratford a certain Thomas Horneby for a debt due by John Addenbrooke, for whom Horneby had become bail. To 1610 belongs another of the dubious Ellesmere documents, in which S. is appointed, along with three others, to preside over the children of the Queen's Revels. In 1611 we find him subscribing towards the expenses of a Stratford road-hill in Parliament. Two years afterwards he buys for £140 a house in Blackfriars, London. In the same year (1613) the Globe Theatre was burnt down during the first performance of

Henry VIII., and S. was engaged in a Chancery suit with reference to his Stratford tithes. In 1614 a project for the enclosure of some common lands near Stratford was warmly opposed by S., and in this year we find the last mention of his being in London. Eulogies by Thomas Freeman, and by the anonymous author of a poem called 'The Ghost of Richard the Third,' belong to the same date. On the 10th of February 1616, S.'s youngest daughter Judith married Thomas Quiney, a vintner of Stratford. On the 25th of March S. executed his will, leaving the bulk of his property to his daughter Susanna and her heirs, money bequests to a considerable amount to his daughter Judith, remembrances in money, plate, &c., to his sister Jone Hart, his 'fellows,' Hemmynges, Burbage, and Cundell, and other acquaintances, and to his wife his 'second best bed, with the furniture.' On the 23d of April he died, and was buried two days afterwards in the old church at Stratford.

Traditions and Conjectures.—The sources of Shakespearean tradition can be numbered on the five fingers. Davenant (1605-1668), a Restoration dramatist whose general credibility may be judged from the fact that he claimed S. as his father on the strength of an old jest-book witticism; Aubrey (1626-1700), an antiquarian gossip; Betterton (1635-1710), a great actor but a poor sifter of evidence; Rowe (1673-1718), a third-rate dramatist of the Grub Street era: to one or other of these four can be traced almost all the well-worn traditions with which we have now to deal; and as the authority of each is about equally good or bad, it is useless here to refer every rumour to its first retailer. It is not improbable that the date of S.'s death (April 23) was also that of his birth. His father is variously represented as a wool-merchant and a butcher. We have seen that he is described in contemporary documents as a glover and a yeoman. The truth may be that he was by trade a glover, but acquiring land with his wife, became a butcher and wool-merchant, as is every farmer who kills his own meat and shears his own sheep. It is only natural to suppose that S. assisted his father, which may explain the tradition that he was apprenticed to a butcher, and that when he killed a calf he would 'doe it in a high stile and make a speech.' That S. attended the Free Grammar-School of Stratford cannot be doubted, and it is also not improbable that he was removed from it earlier than he would otherwise have been on account of pecuniary embarrassments at home. Ben Jonson's statement as to his 'small Latin and lesse Greeke,' has been interpreted as meaning that he was devoid of scholastic culture; but it is almost indisputable that however meagre might be S.'s learning in comparison with Ben's, it was not in itself contemptible. It is even said that he became a country school-master; and it is conjectured, from a contemporary allusion to playwrights who had deserted their original trade of *Noverint*, that he was at one time apprenticed to a lawyer. At eighteen, as we know, he married. From many circumstances—the age of his wife, the short time which elapsed between the marriage ceremony and the birth of the first child, the fact of his migrating, apparently alone, to London, and only visiting his home at intervals of not less than a year, the trifling bequest made to his wife in his will, and other minor indications—it has been inferred that S. was entrapped by youthful passion into an ill-considered and ill-assorted union, and that his domestic life was unhappy. For such a theory there is no real ground. To say that Anne Hathaway was not intellectually a fit mate for him is a sheer nullity in criticism. Nothing in the life or character of S. requires us to believe, or even to imagine, that he wanted an 'intellectual' mate. The undeniable fact that among the yeoman class of Elizabethan England, as in some Lutheran countries at the present day, the formal betrothal or troth-plight was considered as *the* really essential element of marriage, to be followed by the legal formalities at convenience, takes away from the union the appearance of a tardy reparation for an error inconsistent with mutual respect. Mr. Knight, too, has pointed out that the jointure secured to the widow by law amply provided for her, so that the inference drawn from the will also falls to the ground. On the other side of the case, we may mention the tolerably authenticated tradition that at her death in 1623, Anne earnestly desired to be buried beside her husband, a wish which would surely not have occurred to her had their domestic life been one of contention or estrangement. The date of S.'s settlement in London has never been ascertained. It must have taken place from three to six years after his marriage—i.e., between 1585 and

1588. We need not retail the famous deer-stealing legend, which has formed the subject of so much idle controversy, and which is first mentioned in a scurrilous ballad of no value. The declining fortunes of his father had probably more to do with S.'s departure than the persecutions of Sir Thomas Lucy. Whether the visit to Stratford of Burbage's company of players in 1587 formed the final motive with S. for adopting the stage as a profession, it is impossible to say. In any case he is said to have commenced as a 'servitor'—perhaps what we would call a 'super;' or lower still, if we can believe the not impossible tradition that he held horses at the playhouse door, and afterwards, finding his business growing on his hands, organised a company of boys for the purpose, who were known as 'S.'s boys.' It is clear that he advanced rapidly from a 'servitor' to a player, then to an adaptor of plays, and then to a sharer in the theatres (the 'Globe' summer theatre, and the 'Blackfriars' winter theatre). This is not the place to discuss the chronology of his works, but it may be accepted as certain that his authorship commenced as early as 1590, though perhaps he may not have written any complete original play until two or three years later. As a player he was never very distinguished, taking inferior parts not only to Burbage and Kempe, but to several others in the company. The traditions which tell that the Ghost in *Hamlet* was 'the top of his performance,' and that he was successful as Adam in *As You Like It*, are not of a nature to excite scepticism. After 1595 we find his fame and fortune alike growing with great rapidity. Of the eulogistic contemporary allusions we have already spoken, as well as of the cautious and prudent investments in which the solid results of his popularity were embarked. After 1595, if not from the commencement of his London career, he longed for the quiet life of an English country gentleman, and with the calm power and self-containment which are never wanting in the very greatest minds, he worked towards and attained this deliberately-chosen goal of his earthly hopes. Fanciful interpretations of his sonnets have led to conjectures of stormy and passionate episodes in his earlier London life, but these are too unsubstantial to deserve more than passing mention. Nor do the scandalous Joe-Miller tales of Manningham and Davenant require notice, though the former has the merit of being contemporary. More important are the traditions which exhibit S. as the favourite dramatist of Elizabeth and James. Ben Jonson's allusion to 'those flights upon the bankes of Thames' which 'so did take Eliza and our James,' places the matter beyond dispute, and gives a probability to the traditions: that the *Merry Wives* was written at the request of Elizabeth to show Falstaff in love; that an impromptu compliment introduced by S. in playing the part of a king in some play before Elizabeth greatly delighted the Queen; and that James on one occasion addressed an autograph letter of compliment to the poet. The date at which S. returned to Stratford and took up his residence in New Place, is as doubtful as the date of his migration to London, but it may safely be placed between 1606 and 1610. Here he remained until his death, leading outwardly the life of a plain country gentleman, except in those marvellous hours in his study when he was penning the calmest and loftiest of his works. It is almost certain that he still possessed a pecuniary interest in the theatres at which his plays were represented—an interest which perhaps descended to his wife at his death. Tradition speaks of him as a public-spirited citizen, and a good, companionable, and even jovial neighbour. The jests and so-called 'epigrams' which have been fathered upon him are for the most part palpably spurious, yet the fact that they should have been attributed to him at all is significant. The most important tradition of this period is that connected with his death, which asserts that 'S., Drayton, and Ben Jonson had a merrie meeting, and itt seemes drank too hard, for S. died of a feavour there contracted.' Perhaps the fact of the 'merrie meeting' may be genuine, however little weight we may attach to the inference. The tradition that he 'died a Papist' has not a scrap of intrinsic probability or extrinsic corroboration. His wife and his two daughters survived him. Anne S. died in 1623; Susannah Hall in 1649, leaving a daughter, Elizabeth, who, after being twice married, died childless in 1670; and Judith Quiney died childless in 1662. With Elizabeth Hall (Lady Barnard) perished the last lineal descendant of the poet.

Biographers and critics have expended much ingenuity in dividing the life of S. into separate periods of intellectual and

artistic development. Each new critic has a new classification of the plays, and a new mode of mapping out the mental growth of the poet. These fancies are pleasant, and even useful, though any projection of such a 'round and perfect' mind can only represent it conventionally, as Mercator's chart represents the globe. They are so numerous, and so much dependent on the vexed question of the chronology of the plays, which it is impossible here to discuss, that we can only refer the reader to some of their original sources. The monumental 'Life of S.' by Halliwell-Phillipps (Lond. 1848), remains the great storehouse of data and documents, though it might with advantage be revised so as to embody the results of more recent investigations. Charles Knight's 'S., a Biography' (Lond. 1843), ranging further for its materials, forms a rich collection of antiquarian information of all sorts bearing upon S.'s life. Excellent lives of the poet are also prefixed to many of the editions of his works enumerated below, especially to those of Collier, Singer, Dyce, Staunton, and Grant-White. Neil's 'S., a Critical Biography' (Lond. 1861), is an accurate and handy compendium of facts. Wise's 'S.: his Birthplace and its Neighbourhood' (Lond. 1861), and Smith's 'Rural Life of S.' (Lond. 1870), will also be found useful. Among the foremost members of the 'second Victorian school of Shakespeareans,' to whom chiefly we are indebted for theories of S.'s mental growth and development, the most prominent are Messrs. Dowden, Furnivall, and Fleay, whose works, along with that of Gervinus in Germany, will be referred to afterwards. Professor Ward in his 'History of English Dramatic Literature' (Lond. 1875) gives a short life of S., as well as a valuable sketch of the history of Shakespearean criticism. Among other meritorious works bearing upon the biography may be mentioned Drake's 'S. and his Times' (Lond. 1817); Skottowe's 'Life of S.' (Lond. 1824), specially valuable for the sources of his plays; Guizot's 'S. and his Times' (Lond. 1841), instructive though antiquated, having been written as early as 1821; Delius's 'Der Mythos von W. S.' (Bonn, 1851); Ingleby's 'Complete View of the S. Controversy' (Lond. 1861); Grant-White's 'Life and Genius of S.' (Boston, U.S. 1865); French's 'Shakspeareana Genealogica' (Lond. 1869); Ingleby's 'S.: the Man and the Book' (Lond. 1877), a collection of interesting details; the same author's 'Centurie of Prayse' (Lond. 1874), an exhaustive list of contemporary allusions.

Bibliography.*—During S.'s lifetime, as we have seen, eighteen of his plays had been printed in quarto form, some having even gone through several editions. Of these quartos, none is known to have been published with S.'s consent, and many are mere garbled versions, from stolen manuscripts or shorthand notes taken in the theatre. The first authorised edition was that known as 'the first folio,' published by John Heminge and Henry Condell in 1623. This is the date of Anne Hathaway's death, and it has been conjectured that an interest held by her in the stage-right of the plays may have prevented their publication earlier. The full title is 'Mr. William Shakespeare's Comedies, Histories, and Tragedies. Published according to the True Originall Copies.' The volume contains eighteen plays which had not before been printed, viz., the *Tempest*, *The Two Gentlemen of Verona*, *Measure for Measure*, the *Comedy of Errors*, *As You Like It*, *The Taming of the Shrew*, *All's Well that Ends Well*, *Twelfth Night*, *The Winter's Tale*, *King John*, 1 *Henry VI.*, *Henry VIII.*, *Macbeth*, *Timon*, *Cymbeline*, *Coriolanus*, *Julius Caesar*, *Antony and Cleopatra*. *Pericles* was omitted, and *Othello*, which had been published in quarto in 1622, was included, thus making 36 plays in all. The editors professed to print from the poet's MSS., but it is evident that several of the plays were merely printed from the quartos. Still this edition, corrupt as it is, has on the whole the greatest authority of all the old editions. Only a few copies are now extant—the last which came into the market was bought by the Baroness Burdett-Coutts for £714—but it has been reproduced in photographic facsimile by Staunton (1866), and in a reduced form by Messrs. Chatto & Windus (1876); while there is also a useful literatim reprint by Booth (1863). A second folio edition in 1632 was only a careless reprint of the first. The third (1664) contained *Pericles* and six other plays, of which only the *Two Noble Kinsmen* and *Edward III.* seem to have any claim to be regarded as even in part the work of S.

The fourth (1685) was a reproduction of the third. The first critical edition was that of Rowe (1709), in which some of the more glaring errors of the folios were corrected, while there was a praiseworthy abstention from purely conjectural emendation. The same cannot be said of Pope's edition (1725). Pope claims to have 'discharged the dull duty of an editor with a religious abhorrence of all innovation, and without any indulgence to his private sense and conjecture.' This, it has been well said, is a very fair description of what he did *not* do, as he gave the rein to every conjectural whim that occurred to him. Theobald, whose edition appeared in 1733, was a much more industrious and conscientious editor than Pope, and did something to free S. both from the errors of his Elizabethan printer and the 'improvements' of his Augustan editor. Sir Thomas Hanmer (Oxf. 1744) and Warburton (1747) edited after the fashion of Pope, though in some respects they improved upon him. Johnson's edition appeared in 1765. In it the acumen of the great critic was plainly visible, though, owing to his lack of sympathy with the subject, not to mention his want of the necessary Elizabethan erudition, it was largely thrown away. What Johnson lacked was in some measure supplied by Stevens, who, after publishing a reprint of twenty of the quarto plays, collaborated with Johnson in an edition published in 1773. Capell's edition (1768) contained some valuable matters hidden under the veil of an involved and difficult style. Malone, the last of the 18th c. editors, was on the whole the best—learned, laborious, conscientious, and not devoid of sympathy with his subject. His edition of 1790 forms the basis of Reed's (1803 and 1813) and of Boswell's great 'Variorum' (1821), in which his labours are combined with those of Johnson and Stevens. This, it may be said, closes the record of 18th c. Shakespearean editing, though Singer's Chiswick Press edition of 1826 was little more than an abridgment of the 'Variorum.' With the Victorian period a new era of study commenced. Editors came to their work with a wider Elizabethan erudition, deeper philological theories, juster views of the duties they undertook; and, above all, a better appreciation of the poet's genius and spirit. Theoretically, all have agreed in the principle of adherence to the first folio text wherever it is at all defensible, but the variations in practice have been considerable. The strongest partisans of the folio text are Knight (1838-43), Grant-White (Boston, U.S. 1857-60), and Clarke and Wright (Cambridge 1863-66). In the Cambridge text the adherence to the folio readings is perhaps too strict, but the fault is a good one, and the single-volume 'Globe' edition (1864, and frequently republished), in which it is reproduced, is perhaps the best popular issue; though the 'Leopold' edition (1877), which gives the plays in approximate chronological order, with the text of Professor Delius (Elberfeld, 1854), is also to be recommended. Collier, in his edition of 1841, is an enthusiast for the first folio, but his belief in the MS. annotations in a copy of the second folio discovered by him in 1849, led him to the opposite extreme of wild emendation in his edition of 1852. The MS. annotations are now generally considered to be of recent date, and of little value; though they found warm defenders in a controversy of unusual virulence. Among the remaining editions of most note are those of Hudson (Boston, U.S. 1851-57), Singer and Lloyd (1856), Dyce (1857, 2d ed. 1866-68), and Mary Cowden Clarke (1860). About two-thirds of Halliwell-Phillipps' great folio edition, begun in 1853, have now been issued; and an elaborate *Variorum* edition, under the care of Mr. Furness, is also in course of publication in the United States (Philadelphia, 1871). Several 'family' editions have been published, that by Bowdler (1818) having attained sufficient currency to render the term 'Bowdlerised' a cant word for expurgated literature in general. Many separate plays have of recent years been issued for school use. Hunter's editions (1869-73) are among the best, but the more recent Clarendon Press series (edited by Messrs. Clarke and Wright), and the series published by Messrs. Collins of Glasgow (edited by Mr. Neil and others), also form admirable introductions to Shakespearean study.

Study and Criticism.—The S. Memorial Library at Birmingham now contains over 6000 volumes, and is still admittedly incomplete. This fact may help us to form some conception of the extent to which Shakespearean study has been prosecuted in Germany and America as well as in England. The great mass of this literature dates from the present century. We can-

* All books mentioned in the remainder of this article are to be understood as published in London, unless the contrary is stated.

not see the mountain near at hand, says Emerson, speaking of S.; and it was not until nearly two centuries after his death that the world at large became alive to his true greatness. Among his contemporaries he was popular and no more. Despite Jonson's splendid eulogies, there is little doubt that Ben considered himself the better poet of the two. His 'mellifluousness' is the quality chiefly dwelt upon in contemporary allusions; and it is to be noted that the two greatest men of his time—Bacon and Raleigh—do not even mention his name. In the succeeding generation Milton nobly characterises him as the 'dear son of Memory, great heir of Fame,' but the line (*L'Allegro*) in which he describes him as 'warbling his native wood-notes wild,' seems to show that he looked upon him as nothing more than an untutored genius. Fuller's allusion to the wit-combats between S. and Ben Jonson proves that he heartily admired, if he did not adequately appreciate, the colossal genius of the former; and Charles I. is known to have been a student of S., a copy of the second folio with his autograph being preserved in the Royal Library at Windsor. Driven from the stage during the Puritan ascendancy, his plays were revived in garbled and almost unrecognisable forms by Dryden, Davenant, and Betterton after the Restoration. *The Tempest* became a sort of pantomime under the title of *The Enchanted Island*. *The Taming of the Shrew* was rechristened *Sauny the Scot*. Mr. Pepys considered the *Midsummer Night's Dream* 'the most insipid and ridiculous play that ever he saw.' Rymer dubbed *Othello* 'a senseless trifling tale,' and Nahum Tate rewrote an obscure old tragedy called *Lear* without knowing who was its author. Dryden alone seems now and then to have had a glimpse of true insight into the poet's greatness. The history of 18th c. editions and editors affords an index to the estimation in which S. was held in that supremely self-satisfied age. He was a barbarous genius to be patronised, corrected, and trimmed to fit the Procrustes-bed of 'cultivated taste.' Johnson preferred some lines of Congreve to anything in S., and gravely remarks that 'he has speeches, perhaps sometimes scenes, which have all the delicacy of Rowe without his effeminacy.' Goldsmith censures his 'antiquated dialect, obsolete humour, and overcharged characters,' and Collins gives the palm to Fletcher, as compared with S., for the portrayal of female character. Still he was popular on the stage, where Booth, Wilks, Cibber, Macklin, and above all Garrick (q. v.), gained their greatest triumphs in characters from his dramas. The critical labours, too, of Johnson, Steevens, Capell, and Malone only formed part of a general Shakespearean revival, of which Farmer's 'Essay on the Learning of S.' (Cambridge, 1767), and Mrs. Montagu's 'Essay on the Genius of S.' (1769)—the latter an answer to Voltaire's criticisms—may be regarded as the precursors. The Ireland forgeries, an imposture which culminated in the production at Drury Lane of the 'solemn mockery' of 'Vortigern' (1799), and which finally collapsed with the publication of the 'Confessions of W. H. Ireland' (1805), gave an indirect impetus to Shakespearean study. A new revival was, however, at hand. In 1811 Coleridge gave his lectures on S. in London (see his 'Seven Lectures on S. and Milton,' with a preface by Collier, 1856). In them he propounded the theory, now so universally recognised if not always acted upon, that we must come to the study of S. as disciples, not as critics—reverently, not self-sufficiently. Some of his comments are even yet unsurpassed for delicacy and depth of insight. Charles Lamb, in his 'Essays on the Tragedies of S.' (1808), and Hazlitt in his 'Characters of S.'s Plays' (1817), and his 'Lectures on the Dramatic Literature of the Age of Elizabeth' (1820), advanced the cause of a more reverent criticism, as did De Quincey in his 'Britannica' paper (see vol. xv. of his 'Works,' Edinb. 1863). This new æsthetic theory struck the keynote for the textual criticism and archaeological study of the first Victorian school of Shakespeareans, whose labours have been described above. The 'S. Society,' founded in 1841, published during the ten or twelve years of its existence many very valuable reprints of literature bearing upon the elucidation of the poet's text. To this period of study belong such books as Courtenay's 'Commentaries on the Historical Plays' (1840); Mary Cowden Clarke's 'Concordance to S.' (1845; 2d ed. 1860); Collier's 'S.'s Library' (1843; 2d ed. 1875)—along with which may be mentioned Steevens' reprint of 'Six Old Plays,' on which S. founded some of his dramas (1779); W. Sidney Walker's valuable 'S.'s Versification Explained' (1854); the same author's 'Examination of the Text

of S.' (1860). Perhaps the most notable æsthetic work of the period is Mrs. Jameson's profoundly sympathetic 'Characteristics of S.'s Women' (1846), along with which may be mentioned Bucknill's 'Psychology of S.' (1859); 'Medical Knowledge of S.' (1860), and 'Mad Folk of S.' (1867). Here, too, may be noted the strange 'Philosophy of the Plays of S. unfolded' (1857; with a preface by Nathaniel Hawthorne), in which an American lady, Miss Delia Bacon, strives to prove that S.'s works were in reality written by Bacon, Raleigh, and other distinguished Elizabethans, who merely borrowed the name of S., an obscure player, so as to avoid the difficulties in which they would have been involved had they been known as the authors of the plays. This is only a specimen of the thousand 'curiosities of literature' which have grown up around the name of S. The splendid expositions of S.'s genius in Carlyle's 'Heroes and Hero-Worship,' and in Emerson's 'Representative Men,' are too well known to require more than a passing mention. One of the most luminous of the minor essays on S. is that in Lowell's 'Among my Books' (1870). Within the last twenty years—we might almost say within the last ten—a new school of Shakespearean scholars has grown up, whose æsthetic tenets are chiefly founded upon German suggestions, while their textual criticism is largely concerned with the application of 'metrical tests' to decide the genuineness of plays and passages of plays, as well as their chronological order. Messrs. Spedding, Fleay, and Ingram may be called the joint-discoverers and applicators of this new form of criticism, which is best expounded in Fleay's 'S. Manual' (1877), and his 'Introduction to Shakespearean Study' (1877); in Dowden's 'S. Primer' (1877), an admirably compendious introduction to a study of the poet; and in Furnivall's excellent Introduction to the 'Leopold S.' To the æsthetic works of this period belong Dowden's 'S., his Mind and Art' (1876), H. Brown's 'Sonnets of S. solved' (1870), Simpson's 'Philosophy of S.'s Sonnets' (1868), Massey's 'Secret Drama of the Sonnets' (1872), Ingleby's 'The Soule Arrayed' (1872), Hudson's 'S., his Life, Art, and Characters' (Boston, U.S. 1872), Swinburne's 'Three Stages of S.' (in the 'Fortnightly Review,' 1877 and 1876). Among more strictly scientific works, on the other hand, may be mentioned Craik's 'English of S.' (5th ed. 1877), Abbot's 'Shakespearean Grammar' (1876), Ellis's 'Early English Pronunciation' (1869), Stokes' 'Chronological Order of S.'s Plays' (1878), Ingleby's 'S. Hermeneutics' (1875), Mrs. Furness's 'Concordance to the Minor Poems' (Philadelphia 1872). In 1873 the 'New S. Society' was founded, Mr. F. J. Furnivall being appointed its director. Under its auspices many diligent workers are engaged in applying the new tests, collecting, editing, and reproducing 'allusion books,' arranging parallel text editions, and doing active and useful work of all kinds in the great field to which they have devoted themselves. A new Memorial Theatre, Museum, and Library are at present in course of erection at Stratford-on-Avon, and it is expected that the Theatre, at least, will be opened in 1879 on the traditional anniversary of the poet's birth.

Up to the middle of last century S. may be said to have been unknown on the Continent. There are slight traces of him in France before Voltaire 'introduced' him to his countrymen, but they are very slight indeed. Voltaire's views on S. are well known. He characterised him as a *grand fou*, a *sauvage ivre, sans la moindre étincelle de bon goût*, but graciously admitted that he had now and then *des morceaux admirables*—a judgment which was almost literally endorsed by Chateaubriand. A translation by De la Place was published in Paris (1745-48), and upon this Ducis founded his famous adaptation of *Hamlet* (1769), whose general spirit may be judged from the fact that *Hamlet*, left alive at the end, concludes the drama with the reflection, *Mes malheurs sont comblés: mais ma vertu me reste!* A new prose translation by Pierre Letourneur was published in Paris between 1776 and 1782, and of this translation a new edition was published in 1821, with an introduction by Guizot. More recently S. has attracted the attention of many leading French critics, who have attacked or defended him according as they leaned towards classicism or romanticism. See the cautious estimate of Villemain in his 'Mélanges Historiques et Littéraires' (Par. 1827); the brilliant and imaginative essay of Ph. Chasles, 'Études sur W. S., Marie Stuart, et l'Arélin' (Par. 1851); Mézières' valuable 'S., ses Œuvres et ses Critiques' (Par. 1860); Lacroix's 'Histoire de l'influence de S. sur le Théâtre Français' (Bruxelles 1856); and Raymond's 'Corneille, S., et Goethe'

(Par. 1864). A complete translation by F. V. Hugo (Par. 1859-64) was introduced by a singular, striking, if somewhat fantastic rhapsody by Victor Hugo himself, entitled 'William S.' (Par. 1864; translated by Baillot, 1864). Lastly, M. Taine has drawn a highly-coloured and excessively French portrait of S. in his 'History of English Literature' (Edin. 1873-74), in which he speaks of him as 'a nature poetical, immoral, inspired, superior to reason, by the sudden revelations of its seer's madness,' and remarks that 'the "sweet abandonment of love" was the great occupation of his life.'

In German literature, on the other hand, S. has been naturalised as no other writer ever has been in the literature of a foreign country. He was to some extent known even before the time of Lessing (see Cohn's 'S. in Germany,' 1865), but that great critic was really the first to recognise and proclaim his true value. In the 'Literaturbriefe' (1759 and onwards) he, along with Moses Mendelssohn, powerfully upheld S. and the romantic drama against the prevailing French taste of the age, whose critical dictator was Gottsched. In the 'Hamburgische Dramaturgie' (1767-69) Lessing, aided by Schröder on the stage, still further expounded the new doctrines, which were taken up by Herder in an essay on S. (1772); while in the previous year we find Goethe, at a students' celebration at Strassburg, uttering an eloquent panegyric upon the newly-discovered genius. Meanwhile Wieland had translated twenty-two of the dramas (1762-66), and his translation was completed by Eschenburg (1775). Goethe wrote his 'Götz' (1773) 'in the Shakespearean manner,' and struck the keynote of modern Shakespearean criticism in his analysis of *Hamlet* in 'Wilhelm Meister' (1795), though he afterwards modified his views in his essay, 'S. und kein Ende' (1813). Schiller throughout his whole career was profoundly influenced by S., and the minor poets of the 'Sturm-und-Drang' period—Lenz, Klinger, &c.—idolised, copied, and caricatured S. to an extravagant degree. With A. W. Schlegel and F. L. Tieck, however, lies the true credit of having introduced S. to the great German public. Their translation, commenced as early as 1797 and continued slowly until it was published in its complete form at Berlin between 1825 and 1833, is so admirable in every point that it remains the standard German rendering in spite of many able attempts by such men as the Vosses, Simrock, Freiligrath, Bodenstedt, Heyse, Böttger, and Böding to supersede it. (See Bernays' 'Zur Entstehungsgeschichte des Schlegel'schen S.,' Leip. 1872.) Schlegel's 'Lectures on Dramatic Art and Literature,' delivered at Vienna in 1808 (translated by Black, 2d ed. 1846), so much resemble those of Coleridge in the general tone of criticism that the latter has been accused of plagiarism, though the accusation has been thoroughly refuted. The chief merit which they had in common was that of regarding S.'s dramas as masterly not only in matter but also in form, and shaking off entirely the trammels of the French quasi-Aristotelian prejudices. Tieck also published some suggestive, though unequal, criticisms. (See Delius' 'Die Tieck'sche S.-kritik beleuchtet' (Bonn 1846). Since then the range of Shakespearean study has widened and deepened in Germany, until a few years ago her scholars were able justly to claim that they had done more for the elucidation of our great poet than we had ourselves, though now, perhaps, such a claim could scarcely be maintained. Ulrich, in his 'S.'s Dramatic Art' (1846; 3d ed. translated by L. D. Schmitz, 1876), seeks to find a central ethical idea in each drama. A less transcendental æsthetic is applied by Gervinus, whose 'S. Commentaries' (1849, Miss Bunnell's translation, with introduction by Fuornivall, 2d ed. 1877), are elaborate, and, from his own point of view, exhaustive. The fault of this school of criticism is a strained desire to bring S. as a whole into harmony with some particular ethical or æsthetic theory. 'Il devient,' says Mézières, 'panthéiste avec les uns [Rosencranz and Fischer] spiritualiste avec les autres [Ulrich], politique avec un troisième [Gervinus], et avec tous philosophe.' Kreyssig, perhaps more than any other critic of his class, avoids this error. In his 'Vorlesungen über S.' (2d ed. Berl. 1874) he expressly disclaims all wish *an S. ästhetisirende Geistesgymnastik zu treiben*, and yet is eminently suggestive and thorough. See also his 'S. Fragen' (Berl. 1877), as well as Hebler's 'Aufsätze über S.' (2d ed. Bern 1874), and Tschischwitz's 'S.-Forschungen' (Halle 1868). The idolatry of S. in a certain school has called forth an able counter-criticism in Rümelin's 'S.-Studien' (Stuttg. 1866), and Benedix's 'Die Shakespearemanie' (Stuttg.

1873). The *Deutsche S.-Gesellschaft*, which has its headquarters at Weimar, is doing work very similar to that of our own S. Society. Its 'Jahrbuch,' first published in Berlin in 1865, is now under the editorship of Dr. Karl Elze, whose 'Essays on S.' have been translated by L. D. Schmitz (1874), and who has recently published another collection of essays entitled 'William S.' (Halle 1876). Professor Hertzberg is also doing valuable work under the auspices of the Society. To Delius' admirable edition of S.'s works (English text with German notes) we have already referred. His 'Abhandlungen zu S.' (Elberfeld 1878) are also to be noted. In 'Die Quellen des S.' (Bonn 1873), Professor Simrock treats the sources of S.'s plots, &c., from the point of view of a comparative mythologist; and, among the most valuable of recent German contributions to Shakespearean study, we must note Dr. Schmidt's 'S.-Lexicon' (Berl. 1874-76).

Shale, the rock resulting from stratified and hardened mud and clay. It consists in great part of alumina and silica, often highly coloured by oxide of iron; this produces a reddish-brown colour; bituminous shales are black, while the ordinary varieties are usually grey. It is of very common occurrence in various geological formations, typically so in the Carboniferous, where it is known to the colliers as 'bind' or 'blaes'; it very generally contains remains of lepidodendroid plants, ferns, &c., and is frequently so highly charged with carbonaceous matter as to pass by insensible gradations into coal. The Torbanehill mineral, which occurred near Bathgate, in Linlithgowshire, but is now exhausted, so shared in its character the appearance both of coal and slate, that a long and famous lawsuit was needed to decide the question. Immense quantities of S. are now raised in the coalfields of Scotland, and also in certain English localities, for the production of paraffin, &c., the yield varying in good samples from 20 to 50, and in exceptional cases even 70, gallons of crude oil per ton. Certain shales in the Liassic formation can be made to yield similar products, and in all probability many of the anthracite shales of the Silurian system will soon be in like manner utilised. Alum can also be profitably obtained from many shales, but although a few large works have already sprung up for its manufacture, the process is still capable of very great extension. Some of the softer shales are often ground down separately or along with clay in the manufacture of bricks, drain-pipes, &c., and the finer qualities of slate-pencil consist of sticks of soft grey S. In the United Kingdom, in 1874, 362,747 tons of S. were produced, chiefly oil-S. See PARAFFIN.

Shalloon, a kind of worsted stuff, originally manufactured at Chalons, in France, of which the name is a corruption.

Shall'op (Fr. *schaloupe*), a broad, open, schooner-rigged boat, with two masts.

Shall'ot (Fr. *eschalotte*, from Lat. *Ascalonitis*), the *Allium Ascalonium* of botanists, is a native of Palestine; particularly, it is said, the coast districts about Askalon. The bulbs are compound, separating like garlic into 'cloves.' These are used in the same way as onions in soups and stews; in a raw state are cut small as a sauce, and also make an excellent pickle.

Shamanism, the name applied to the religion of the Turanian races inhabiting Siberia and N.E. Europe, whose cultus and mythology are wholly influenced by a belief in magic, and consequently animistic in their character. All the spirits to whom they offer homage, chief among them Ukko the Heaven-God, are nature-beings, less eminent for moral gifts than magic powers, whose dreaded force, however, may be averted or even turned to advantage by means of the spells of 'shamans' or sorcerers. Concerning the title *shaman*, Max Müller observes in *Chips from a German Workshop*, vol. i. p. 190:—'The only trace of the influence of Buddhism among the Kudic races, the Fins, Lapps, &c., is found in the name of their priests, *Shaman* being supposed to be a corruption of *Sramana*, a name applied to Buddha and to Buddhist priests in general.' And concerning the Shamans themselves Castrén says that they 'are practised in all sorts of conjuring-tricks, by which they know how to dazzle the simple crowd, and inspire greater trust in themselves.' One of their commonest tricks, described by him in *Reiseberichte*, p. 173, resembles closely the performance of the Davenport Brothers. The shaman sits bound in the midst of a darkened chamber,

when suddenly bears growl and serpents hiss, and lo! the door opens, and the wizard, unbound, enters from without. See Tylor's *Primitive Culture* (2 vols. Lond. 1871).

Sham'li, a town in the district of Mozuffernuggur, N.W. Provinces, British India, on the E. Jumna Canal, 24 miles W. of Mozuffernuggur. There is some trade and manufacture, but the people suffer from malaria caused by bad drainage. Pop. (1872) 9177. During the mutiny of 1857 S. was captured by the mutineers, and 113 of its brave native defenders were killed.

Shamm'ai was the colleague of Hillel I. (q. v.) during part of his presidency of the Jewish Sanhedrim (B.C. 30-A.D. 10). Of his personal history very little is known. He is said to have been of a stern, forbidding temper; in which respect, as well as in his decisions on many rabbinical questions, he was the antithesis of his colleague. The disciples of the two—the school of Hillel and the school of S.—formed two irreconcilable parties, whose mutual antipathy showed itself not merely in words but sometimes in blows and bloodshed.

Sham'oy, or **Shamm'y**. See CHAMOIS.

Sha'mo. See GORI.

Sham'rock (Ir. Gael. *seamarag*, compounded of *seamar*, 'trefoil,' and *og*, 'little,' *Prior*) is the national badge of Ireland—worn by many Irish on St. Patrick's Day. In the Dublin and Covent Garden markets both the black nonsuch (*Medicago lupulina*) and the white clover (*Trifolium repens*) are sold and accepted as the emblem. According to Dr. Moore of Glasnevin, the first of these has for many years been recognised in Ireland as the true S.

Shamyl or **Schamyl** (Eng. 'Samuel'), was born at Himri in Northern Daghestan, in 1797. He was a member of a family of high descent, and soon became a leader among the Circassians. Perceiving that the tribes, if disunited, would inevitably succumb to the aggressive force of Russia, he zealously seconded the efforts of Kasi Mollah, a Mohammedan reformer, to produce unity among them. In 1832, when Himri was besieged by the Russians, he fought with great gallantry, and after the fall of the place, he miraculously escaped, though pierced by two balls. In 1834, Kasi Mollah having been slain, S. was chosen chief. He at once set about organising the tribes, and defeated the Russians in 1837. In 1839, however, they captured the fortress of Akulgo, into which he had thrown himself, and, lest he should escape, put to the sword every being in the place. Yet the hero managed to escape, and recommenced the war with greater zeal and daring than ever. By 1844 he had established a regular government, with Dargo as capital. He contrived to keep his enemy at bay till 1852. In that year Bariatinsky succeeded in detaching several tribes from S., and cowed others by systematic devastation. After a brief respite during the Crimean war, S. was again hard pressed in 1858, when the Russians destroyed upwards of 100 villages. In 1859 his last fortress fell, and after wandering for some months among the mountains, he was captured at Gounib. Taken to St. Petersburg, he received a pension, and was chivalrously treated by the Czar. He died at Medina when returning from Mecca in March 1871.

Shanghai, the chief commercial city in China, in the province of Kiang-su, on the left bank of the Wusung, 14 miles from the Yang-tse-kiang, is built on a level tract of alluvial soil, intersected by navigable water channels. It stretches for 2 miles along the river, and is surrounded by a wall 3 miles long, outside of which are populous suburbs. The houses are built of brick and the streets are narrow, dirty, and overcrowded. S. contains numerous temples, chief among which are the *Ching-hwang*, or temple of the city gods, and the temples of the god of war and the god of riches. It has a Roman Catholic cathedral and several mission churches. To the N. of the town is the foreign settlement, consisting of three quarters—the French, English, and American or Hongkew. These colonies occupy territorial concessions, and are self-governing. The French municipality is called the 'Conseil de l'Administration Municipale Française,' the English and American joint executive is the 'Council for the Foreign Community of S.' There are also consular courts, an English Imperial court, and a mixed court. The working of these courts has been a subject of much perplexity. By the 'China and Japan Order in Council,

1878,' published on 23d August of that year, a supreme British court for all China has been established. S. was opened to foreign traders in 1842. In 1853 the Taeping rebels seized it, and held it till 1855. They laid waste the surrounding country and much hindered the commercial progress of S. Although tranquillity has long since been restored, much of the neighbourhood is still scantily peopled. The foreign quarter, now inhabited by large numbers of Chinese, has many fine residences, warehouses, factories, dockyards, &c. But the Chinese still manifest much opposition to engineering works. The mouth of the Wusung is obstructed by a bar, and the Wusung Railway, 9½ miles long, was opened by an English company as far as Kangwan, in June 1876. The working of the line, interfered with by native officials for a time, was resumed in December 1876, and the number of passengers during that month amounted to 17,527, of whom 15,873 were third class. A Polytechnic Institute and Museum have been opened to educate the natives. The numerous canals will long prevent the extension of railways, while in regard to steamships the Chinese are becoming our serious rivals. A native company under government protection conducts the local traffic in the Yang-tse-kiang, and a large native iron foundry has been started at Hongkow. S. has some manufactures of silks, glass, paper, coarse cotton goods, and gold, silver, and ivory wares, but is chiefly important for commerce. The district itself does not consume much, but it forms a centre for communication with all N. China, above 7000 junks being employed in transit traffic. In 1876 S. imported foreign goods to the value of £12,556,134, as follows:—Of opium (chiefly Malwa), £4,848,738; cotton piece-goods, £4,706,856; woollen piece-goods, £1,096,606; iron, £154,462; lead, £175,399; timber, £228,627; coal (121,029 tons), £175,000; also much ginseng, isinglass, seaweed, &c. In addition to the above, £1,435,246 worth of foreign goods were imported indirectly from Hong-Kong and other ports. As £463,736 were re-exported to foreign countries, and £9,735,544 to other ports of China, the net value of the imports of foreign goods to S. was £3,792,110. Great Britain sent nearly half the gross quantity, viz., £6,063,974. Of native produce (chiefly silk, tea, cotton, straw-bags, bamboos, bean-cake, buttons, chinaware, fans, fish, flower-seeds, fruit, fungus, ginseng, grass-cloth, hats, hemp, hides, deer-horns, matting, oil, opium, paper, rhubarb, rice, skins, sugar, tallow, tobacco, &c.), S. imported from other Chinese ports £11,191,873, and from Hong-Kong £299,629; and re-exported to other Chinese ports, £3,765,762; to foreign countries and Hong-Kong, £4,901,154 (of which £2,981,419 went to Great Britain). Thus the net imports of native produce at S. amounted to £2,734,586. The exports of native produce from S. was to foreign countries, £7,500,717; to Hong-Kong, £240,506; to other Chinese ports, £3,167,528; total, £10,908,751. Adding to this the value of the re-exports of native produce as given above, the gross value of the export trade was £19,665,667. The chief exports (besides re-exports) were silk, tea, raw cotton, nankeens, earthenware, wheat, vegetables, &c. During 1876 there entered 1407 steamers of 1,158,219 tons (of which 517 of 463,469 tons were British), and 549 sailing ships of 144,062 tons (of which 204 of 81,560 tons were British); and there cleared 1395 steamers of 1,143,625 tons (of which 512 of 455,326 tons were British); and 572 sailing ships of 156,624 tons (of which 210 of 87,250 tons were British). Of the other vessels that entered the port in 1876, 504 of 348,234 tons were American, 461 of 223,202 Chinese, 94 of 54,258 German, 39 of 57,462 French, and 47 of 51,456 Japanese. In 1876 the foreign settlements contained 160 firms and 1951 whites, besides 151,000 Chinese (including boat population). Total pop. of S. (1876) 278,000.

Shank'lin Sand, a name commonly applied to the Lower Greensand of geologists. It occupies a position between the Wealden strata and the Gault, and is typically represented in the Isle of Wight and on the coast of Kent. Its greatest thickness is about 800 feet, made up of calcareous sandstones, sands, and clays. The latter are in many cases used as fuller's earth. The fossils are numerous and chiefly marine, though remains of reptiles, such as *Iguanodon mantelli*, are occasionally found.

Shann'on (the *Senos* of Ptolemy; Irish Gael. the 'Old River,' probably meaning that from time immemorial people had lived on its banks or fished in its waters), the largest river of Ireland, rises at the S. base of Cuilcagh Mountain in the county of Cavan,

at a height of 280 feet above the sea, flows first S.W. and then S. through Loughs Allen, Forbes, Ree, and Derg to near Limerick, where it turns W. and joins the Atlantic by an estuary 43 miles long, and 7 miles wide at its entrance. Its total length is 220 miles, and its drainage area is 6946 sq. miles. It receives from the W. the Boyle, Suck, and Fergus; from the E. and S. the Inny, Brosna, Mulkear, and Maigue. The navigation of the river was formerly much impeded by shallows and sandbanks, but upwards of £500,000 having been spent upon improvements by the commissioners who were appointed in 1837, navigation is now clear from the upper extremity of Lough Allen to Limerick, a distance of 143 miles, forming, with the Boyle and Strokestown branches, a river and canal communication of 158 miles, for large vessels 129 miles. The S. is connected with Dublin by the Grand Canal from S. harbour near Banagher, and by the Royal Canal, which joins it at Tarnonbarry, near Longford.

Shan-se', a province in the N. of China (q. v.), W. of Pe-chi-li. Area, 65,969 sq. miles; pop. (1852) 20,166,072. The surface is mountainous, and coal, iron, and copper are found. Though the land is fertile, the supply of water is irregular, and from 1875 to 1878 this province, along with Shen-se, Ho-nan, and part of Pe-chi-li, has been desolated by famine. Five million persons have perished in S. alone, and in the district of Tse-yuen, the capital of S., the population, according to the Roman Catholic bishop, has been reduced from 1,000,000 to 160,000.

Shap'inshay, one of the Orkney Islands (q. v.) off the coast of Pomona, about 5 miles N. of Kirkwall, is of irregular shape. Its extreme length is 6 miles, its breadth $4\frac{1}{2}$; pop. (1871) 949. The island is flat and well cultivated.

Sha'ri ('river'), a large Central African river which enters Lake Tchad (q. v.) at its southern extremity after a course probably exceeding 600 miles in length. Previous to dividing into the several mouths by which it enters the lake, the breadth of the S. is fully 600 yards.

Shark, the name given to the larger fishes belonging to the division *Selachii* of the order *Elasmobranchii* (q. v.). Included in this group is the Dog-Fish (q. v.), which resembles the S. in most points of structure. The body of the S. is long and tapering. The tail is unequally lobed. The mouth is placed on the under surface of the head, thus compelling the animal to turn on its back in order to bite freely. The nostrils are on the under surface of the snout, and the gill-openings or branchial slits are numerous—five being common. The dorsal fins number one or two; the ventral fins, as in all elasmobranchiate fishes, occurring towards the rear of the body. The gills are in the form of pockets, lined by a vascular membrane, thus differing from the ordinary comb-like gills of common fishes; the *operculum* or gill-cover in the latter being wanting. Water passes into the gills by the mouth, and is ejected by the gill-slits, but it may also pass into the gills by two apertures named *spiracles*, on the head, which open into the mouth-cavity, as in the skates and rays. The scales of the S. are *placoid*. The eggs are contained in capsules or cases of horny matter resembling seaweed. These egg-cases are popularly named 'Mermaids' Purses,' and are frequently met with on the sea-coasts. As far as development is concerned, the S. is notable for a structure which in some degree resembles the Placenta (q. v.) of higher animals. This *placenta*, however, though aiding in the development of the young, is not strictly homologous with the structure of that name occurring in Mammalia (q. v.). The skeleton of the S. is cartilaginous; its rudimentary nature contrasting with the high organisation of the brain and other soft parts.

Of sharks a large number of genera and species exist. One of the best known is the White S. (*Carcharias vulgaris*), found in the Mediterranean and other seas, and sometimes attaining a length of 25 or 30 feet. It is a ferocious creature; its teeth are similar and have notched edges, and its liver affords oil. It is captured by means of a strong line and hook. The Blue S. (*Squalus glaucus*) also occurs in the Mediterranean Sea, and is found occasionally on the S. coasts of Britain. Its average length is 7 or 8 feet; it is destructive to food-fishes, and is frequently captured in fishermen's nets. The Fox-S. or Thresher, also named the Sea-Ape (*Alopias vulpes*), attains a length of from 10 to 12 or 15 feet. It is notable for the great development of the upper lobe of the tail. The Fox-S. is sometimes captured off the British coasts, but is more frequently met with

in the Atlantic Ocean. One of the most singular members of this group is the Hammerheaded S. (*Zygana malleus*), the head of which is lengthened laterally to form two prominent processes on which the eyes are placed. The hammerhead is common in the Mediterranean, but is also found in the S. coasts of Britain. The Porbeagle S. (*Isurus cornubicus*) and the Beaumaris S. (*I. Monensis*) are two notable British species of S., the former measuring from 4 to 6 feet. The huge Basking S. (*Selache* or *Cetorhinus maximus*) attains an occasional length of from 35 to 40 feet. It is common round both the northern and southern coasts of Britain, and despite its huge proportions does not appear to be of a ferocious disposition. The Greenland S. (*Scymna borealis*) attains a length of from 12 to 14 feet, and is said to attack whales and allied mammals of the N. Seas. The Spinous S. (*Echinorhinus spinosus*) derives its name from the fact that its placoid scales are provided with spines. It attains a length of 7 or 8 feet, and is northern in its distribution. The fishery for S. is prosecuted chiefly on the N. coasts of Europe. The liver is valued for its oil, but the flesh of several species is not unpalatable.

Sharp (#), a musical sign, which, when used as a prefix, raises a note one semitone above its normal position on the scale. The sign for double S., raising a note two semitones, is x.

Sharp, William, a line engraver, was born in London, January 29, 1749. He served an apprenticeship to a bright engraver, and after much rough humble work, acquired some skill as a writing engraver. On the publication of the *Novelist's Library* he gained a high reputation by his treatment of Stothard's graceful drawings, but his full power was only shown later in his execution of large plates, such as Guido's 'Doctors of the Church Disputing,' West's 'King Lear in the Storm,' Carlo Dolci's 'Virgin and Child,' and Copley's 'Siege of Gibraltar' and 'The Parting of Charles I. from his Family.' He was elected an honorary member of the Imperial Academy of Vienna, and of the Royal Academy of Munich in 1814, and died at Chiswick, July 25, 1824. S. was one of the ablest of English engravers, his style being at once manly and nervous.

Sharpe, James, was the son of the sheriff-clerk of Banffshire, and was born in Banff Castle, May 1618. By the mother's side he was connected with the Earls of Rothes. He studied at Marischal College, Aberdeen. When the Solemn League and Covenant was framed, he brought odium upon himself by discountenancing it, and retired for some time to England, where he made the acquaintance of some of the great English divines, such as Saunderson and Taylor. At the commencement of the civil wars he returned home, and shortly afterwards was appointed professor of philosophy at St. Andrews. In 1648 he became minister of Crail, and resigned his chair. At this time he had the reputation of being a warm Presbyterian. Cromwell rather admired his abilities and tact. S. was secretly but actively engaged in the schemes of Monk for Charles's restoration, and was sent to Breda to seek that monarch's adhesion to the Presbyterian form of worship. He came back with a letter from the King expressing a resolution to preserve the government of the Church of Scotland as 'settled by law.' To Charles (and perhaps by this time to S.) the phrase meant Episcopacy; to the Scotch ministers it meant Presbyterianism. In 1661 he was consecrated Archbishop of St. Andrews, and was credited with a full share of those cruel and oppressive measures by which the government sought to destroy the national form of religion. His life was first attempted by a fanatical preacher named Mitchell (July 19, 1668), and finally taken by a band of persecuted Presbyterian desperadoes at Magus Moor, near St. Andrews, 3d May 1679, under circumstances that might awaken sympathy even among those who detest his policy and do not admire his character. See *A True and Impartial Account of the Most Reverend Father in God, Dr. James Sharp, Archbishop of St. Andrews* (1719), and Burton's *History of Scotland*.

Sharpshooters were soldiers skilled in the use of the musket or rifle who in warfare acted independently of the mass of troops, their special function being to shoot down particular individuals. The name fell into disuse after the formation of corps of riflemen and the improvement of army organisation.

Shat-el-Arab. See EUPHRATES.

Shave-Grass. See Equisetum.

Shawl (Pers. and Hind. *shāl*), an outer garment for covering the shoulders, worn particularly by women, and also by men in the East; the plaid, a kind of S., likewise forms a part of the distinctive costume of the Scottish Highlanders. Shawls are made of wool, silk, cotton, or other textile material. The costly shawls produced in the valley of Kashmir and in the Punjab with the soft inner wool (*pashmina*) of the Thibet goat have acknowledged pre-eminence; in fact, for texture, beauty of design, and harmony of colour, no finer fabric is produced at the loom. The wool retains colours of the most brilliant and delicate hue. The Indian loom is vertical and very rude, and it carries many skewers or spindles wound with the various dyed wools necessary for the pattern; no shuttle is employed. Figured Kashmir shawls are of two kinds—1. those in which the pattern is woven with the ground at the loom, and 2. those wherein the foundation of plain pashmina cloth is alone loom-woven, the pattern being afterwards wrought in by elaborate needlework. The former, 'Tilikar' or 'Kāni Kār,' are more valuable than the latter, 'Amli Kār;' £300 not being an uncommon price in Kashmir for one of the first quality weighing 7 lbs. Export duties, cost of carriage, and risk of damage in transit greatly enhance the sum demanded for such a S. by an English or French broker. The loom-woven shawls are seldom executed in one piece, but in several strips which are darned together with marvellous neatness. For both kinds of Kashmir shawls borders having a silk warp are separately woven and sewn on. Amritsar is the great emporium of the Indian S. trade. In 1851 the total yearly value of the exports was about £85,000, and it increased annually till 1862, in which year nearly £300,000 were reached. Since then European competition with imitation Indian shawls has led to a decline in the exports.

The first attempt in Europe to manufacture shawls in the Indian style was made at Norwich in 1784; the earliest were woven in pieces and joined together, but in 1805, with improved appliances, shawls were executed in one piece. In Paisley and Edinburgh the manufacture was established in 1802. The products of the former place have gained considerable celebrity for beauty and cheapness; and while the trade still languishes there, in Edinburgh it has been extinct for thirty years. Paris began the manufacture early in this century, and the invention of the Jacquard loom soon after greatly advanced it. Increased economy in the production was effected about 1834 by the introduction of a process called *epoulind*. The imitation Indian S. industry finds its greatest development and perfection at the present time in Lyon and Vienna, where imported Thibet goat wool, and also the finest Electoral wool-fleeces, are used; but in these places, as elsewhere, the industry is decaying. The manufacture of common plain and chequered woollen shawls of large and small sizes is briskly carried on in Scotland, at Tillicoultry, Alva, Alloa, and other towns on the Forth, and also at Paisley. Huddersfield, Rochdale, Chipping-Norton, and other English towns are also important seats for the production of figured shawls, plaids, and maids in wool and mohair. In America, Massachusetts has won considerable reputation for the lightness and softness of its all-wool plaid shawls—formerly known as the Bay State S., after the mill which originated it—of which there is an immense production. Silk shawls embrace the crapes, in imitation of Chinese work, made at Norwich and Lyon, and the genadines, chemilles, &c., chiefly of French manufacture.

She'a. See BASSIA.

Shearing-Machine, the name given to a machine used in the manufacture of woollen cloth, for shortening the nap and smoothing the surface, and also to one employed in cutting iron plates, bars, &c.

Shears (from the Old Eng. *scēran*, 'to cut'), an instrument resembling scissors of a large and heavy make, having two bevelled cutting edges, and loops or wooden handles varying much in shape. S. take the form best adapted for the use they are to be put to, whether for cutting cloth, grass-borders or hedges, metal plates or pipes, or clipping sheep.

Shearwater (*Puffinus*), a genus of *Natatorial* birds allied to the Petrel (q. v.), and represented by the Greater S. (*P. major* or *cinereus*), and the Manx S. (*P. anglorum*). The wings are long and pointed, and the hinder toe is rudimentary. The bill is long, and the upper mandible is curved or hooked at its tip. The Greater S., also named the Cinereous S., attains a length of 17 or 18 inches, and is of a sooty brown hue above and grey below.

It occurs on the S. W. coasts of Britain; the Manx S., found on the N. coasts, has a wider distribution than the other species. The Manx S. is of smaller size, and is greyish black above and white below. The name S. is also applied to the *Rhynops nigra*, also specifically named the Crimson S. or Scissor Bill.

Sheath-Bill (*Chionis*), a peculiar genus of *Rasorial* birds, of which the *C. alba* or White S.-B., occurring in the Australian and New Zealand coasts and on the islands of the South Seas, is a good example. The bill is short and stoutly made, its base being covered by a horny sheath, which the bird can erect or depress at will. The colour of the bird is pure white, and its length averages 15 inches. The hinder toe is short and elevated on the tarsus; the front toes long and united at the base. The food consists of molluscs and crustaceans.

Sheathing, in shipbuilding, is a covering of plates of copper or an alloy of that metal applied to the bottom of a wooden ship, to protect it from the ravages and attachment of marine animals and weeds. Muntz's metal, composed of 60 parts of copper and 40 of zinc, is very generally employed. Sheets of various sizes and thicknesses are used, and they are nailed to the ships' bottom with nails composed of copper and tin, each sheet slightly overlapping its neighbour. Copper S. was introduced into the British navy in 1783. Its efficacy lies in oxidation by the seawater, but this change proceeds so rapidly that the copper requires renewal every five years or thereby. Muntz's S. was patented in 1832; it resists oxidation, and is very durable and cleanly.

Sheave is the grooved wheel in a block or pulley over which the rope or chain runs.

She'ba. See SABÆANS.

Sheboygan, a town of Wisconsin, U.S., on Lake Michigan, at the mouth of the S. river, 60 miles N. of Milwaukee. It has a fine harbour, where 500,000 bushels of wheat are annually shipped, 10 churches, 3 newspapers, and numerous manufactories, while there are many mills at the S. Falls, on the river, 6 miles above S. Pop. (1875) 6828.

Shechem. See NABLUS.

Shechi'nah (late Heb. 'habitation,' from Heb. *shachan*, 'to dwell') is a term which is not found in the Bible, but which was used by the later Jews, and borrowed from them by Christians, to express the Divine Presence. It is first used in the Targums as a periphrasis for God, with special reference to his presence in the Tabernacle and Solomon's Temple, although not in Zerubbabel's, for the absence of the S. from the latter was among the points in which it differed from the former. Its return, however, was expected in the time of the Messiah. The visible symbol of the S. was a most brilliant light or glory enveloped in a cloud, so that in general only the cloud was visible, but sometimes appearing out of the cloud (cf. Exod. xiii. 21, xiv. 24, xix. 9, 16, 18, xxiv. 16, 17, xl. 34, 35; Num. vii. 89, ix. 15, 16, xiv. 10, xvi. 19, 42). It is distinctly to be understood that the name S. is never applied in the Targums either to the cloud or the glory, but only to the presence which is indicated by these things. Allusions to the S. are supposed to occur in the New Testament (cf. Luke ii. 9; John i. 14; Acts vii. 2, 55; Rom. ix. 4; 2 Cor. xii. 9; Rev. xxi. 3).

Sheep (*ovis*), a genus of *Ruminant* (q. v.) quadrupeds, belonging to the family *Bovide*. Both sexes as a rule have horns, but in some S. horns are wanting in the female. The forehead is flat or concave. No special odoriferous secretion is exhaled from the male S. as from the goat. The domestic S. (*O. aries*) is the typical species, but there are very numerous varieties of it. The various 'wild' S. seem to differ materially from existing domestic breeds, but it is quite possible that the process of domestication and breeding by man may have generated these differences. Wild S. are inhabitants of mountainous regions. Timid in the domesticated state, the ram will nevertheless occasionally defend itself and its flock with fortitude and pugnacity, and may pit itself with success even against the bull; butting with great force and agility, and even throwing its antagonist. The wool of wild S. is short, and there is an outer covering of long hair; domestication and breeding have, however, the effect of increasing the wool and diminishing the hair. In certain breeds of S. which have been neglected, the hairy outer coat becomes better developed than in ordinary breeds, and a *reversion* to the natural state of the fleece is thus seen. Of foreign breeds one

of the most remarkable is the Fat-tailed S. of Tartary and Syria. It is remarkable for the development of fat on the tail and hinder-quarters—a development weighing from 40 to 80 lbs. The Cretan or Wallachian S. has large horns and soft wool. The Moufflon (q. v.) is represented by the Argali (q. v.) of Siberia and Central Asia. The Bearded Argali, or Aoudad (q. v.), is the *Ammotragus Tragelaphus* of N. Africa. The Rocky Mountain S., or Bighorn (q. v.), is famous alike for its flesh and wool.

Of the breeds of S. which have become extinct, one of the most curious was the Ancon or Otter S., the ancestor of which was bred from an ordinary ewe and ram by Seth Wright, a Massachusetts farmer during last century. It had a long body and very short legs, and a whole flock was bred from it, the progeny always being either a pure Ancon or an ordinary S. The Ancon breed was neglected after the introduction of the Merino (q. v.), perhaps the most famous of all the breeds of S. The Merino S. is difficult to fatten, and its flesh is not of high quality. The horns of the males are spirally twisted; the females are usually hornless. The merinoes are kept in large flocks in Spain, the flocks being driven to the mountains in summer, and the winter spent chiefly in Andalusia. The chief shepherd, or *mayoral*, has charge of a large number of flocks, in each of which 10,000 S. may be included. S.-shearing begins in Spain on May 1st, and is performed under cover, the S. being kept closely confined together, the perspiration causing the fleece to separate readily. In Germany the merino breed is highly valued, and at Stolpen in Saxony the most famous breed is cultivated. The merinos were first regularly brought to Britain in 1787, but the native varieties are more valuable to the British S.-breeder. One of the most famous breeds is the Blackfaced S. (q. v.) of the N. of Scotland, which presents close resemblance in many points to the wild S. The Welsh S. has also both sexes horned, and allied to the latter are the Shetland S. and that breed found in the N. islands of Scotland. The Forest S. was so named from its being bred in the ancient forest-lands. It is almost extinct, but wherever bred, the mutton is in demand. The Dorset S. is a breed with small horns in both sexes. The Cheviot S. (q. v.) is a well-known breed in Scotland and in many parts of England, its characteristics being the absence of horns in both sexes, and its adaptation to high lands. The Leicester breed is also hornless; its wool is long, and it fattens readily on flat lands. The Cotswold or Gloucester S. was celebrated in the Middle Ages. It is now, however, crossed with other breeds, and specially with the Leicester S. The famous Southdown S. is hornless, generally white-coloured, has a short curly fleece, and will breed with facility when crossed by most other varieties. The Iceland S. is notable for the number of its horns. The wool is long and fine, and the flesh is of excellent quality. S.-breeding has become an art on which the highest skill of the breeder and agriculturist is brought to bear. The young are born in spring, and one, two, or three lambs may be produced at a birth. The lambs are suckled for about three months, the annual S.-shearing taking place in May. The milk of the S. was used in ancient times, but even in the most primitive districts it is rarely drunk at the present time. The food consists of grasses, supplemented by turnips, mangold-wurzel, beans, oil-cake, and other fodder. The diseases of S. (see ROT) are numerous, and have been made the subject of special study by veterinarians.

The *Stealing of S.* is by statute felony, the penalty ranging from two years' imprisonment to fourteen years' penal servitude.

Sheep Bot-Fly. See BOT-FLY.

Sheep's-Head Fish (*Sargus*), a genus of *Teleostean* fishes belonging to the family *Sparidae*. *S. ovis* is common in summer on the N. American coasts, and may attain a weight of from 12 to 15 lbs. It is caught by lines and nets, and is palatable. The teeth are sharp in front, and rounded in the back of the mouth. Another species is *S. Rondelii* of the Mediterranean.

Sheep-tick, or Sheep-louse, the name given to a species of flies, or *Dipterous* insects, belonging to the family *Hippoboscidae*, or *Forest Flies*. The S. is the *Melophagus ovinus* of Linnaeus. The body is horny and flattened, the antennæ are rudimentary, and the proboscis is formed by the labium and maxillæ. The head is wider than the chest, and the proboscis is long. The limbs are short and thick, and the abdomen is unjointed. The larvæ appear to be hatched within the body of the female. The S. fixes itself in the skin of the sheep by means of its proboscis. The larvæ become pupæ immediately after birth.

Sheerness, a seaport and royal dockyard in Kent, 52 miles E. of London by rail, occupies the N.W. angle of the Isle of Sheppey (q. v.), and thus commands the mouths of the Thames and Medway. It consists of the four suburbs of Blue Town, Mile Town, Ranks Town, and Marina, the last of which is growing to be a favourite watering-place, while the first contains the dockyard, and is strongly fortified. S. has two churches, a Roman Catholic chapel (1864), designed by E. W. Pugin in Second Pointed style, large naval and military barracks, a pier 3000 feet long, and a sea-water bath, with an area of 11,259 sq. feet. The dockyard, covering 60 acres, and employing some 2000 men, comprises a wet-dock of $3\frac{1}{2}$ acres, two others of smaller size, three dry-docks, each 248 feet long by 88 feet wide, &c. In July 1878 ten vessels of the Royal Navy were stationed here, besides four steam tugs. S. publishes two weekly newspapers, and had a pop. (1871) of 13,956. Captured by the Dutch under De Ruyter in 1667, S. was shortly after fortified, but the dockyard was not commenced until 1814, since which time nearly £3,000,000 has been expended on its construction.

Sheers, a kind of hoisting apparatus used in masting or dismasting ships, putting in or taking out boilers, &c. They consist of two long spars or *legs* in an inclined position, so that the upper ends meet and are secured together. The legs are steadied by guys, and from the top depends the necessary tackle for hoisting. S. are usually erected on a wharf in dockyards, but formerly were mounted on an old ship termed a *sheer-hulk*.

Sheet (Old Eng. *sceat*, from *scaban*, 'to shoot,' 'extend,' comp. Ger. *schote*), the rope fastened to the after or leeward corner or 'clew' of a sail, *extending* it to the wind. The rope attached to the weathermost clew is called a 'tack,' except in the square sails above the 'courses.' The *S.-Anchor* (older form *shoot-anchor*) is the largest anchor of a ship, *shot* out in extreme danger.

Sheet'ing, a term applied to linen or cotton cloth, bleached or unbleached, used chiefly for bed-sheets; also in hydraulic engineering, a continuous wall of timber or metal for protection of a river bank.

Sheff'ield ('the field on the Sheaf'), a town in the W. Riding of Yorkshire, and the home of the steel trade, is picturesquely situated on a succession of hills, amid whose dells and dingles the Don makes a mighty bend, receiving here the Sheaf, Kivelin, and two other streams. It is 162 miles N.N.W. of London by rail, 53 S.S.W. of York, and 41 E. of Manchester. Ancient in origin but modern in its growth, the population having sextupled within the present century, S. has few historic relics, though almost all its buildings are old enough to have grown black with the overhanging smoke that has gained it the title of the 'City of Soot.' Its 13th c. Castle, in which Mary Queen of Scots was a prisoner (1570-84), was demolished by the Parliament in 1648; but a part of the Manor House of the Earls of Shrewsbury, where Wolsey rested on his last journey (1530), is still standing, and in 1873 was restored by the Duke of Norfolk. The one old church, St. Peter's, a perpendicular structure of the 16th c., with a crocketed spire 180 feet high, a fine organ just rebuilt, and the Shrewsbury Chapel containing some stately monuments, is now (1878) being enlarged by the addition of two bays to the arcades, a S. porch, and N. and S. transepts, and when completed will measure 165 feet long by 98 feet wide. Of the 32 other Anglican churches need only be noticed St. Paul's (1720); St. James' (1788; restored 1876), St. George's (1825), with a tower of 139 feet; All Saints' (1867), with a spire of 190 feet; St. John the Baptist (1874); and the Sale Memorial Church (1876-78), with a tower of 130 feet, this last the first of nine new churches to be erected in the next five years. Nor are any of the 93 non-established places of worship especially remarkable, except the Roman Catholic Church of St. Marie (1850), decorated in style, and having the loftiest spire in S. (195½ feet). The public buildings include the Townhall (1808-67); Corn Exchange (1830); County Court Hall (1855); Police Buildings (1867); Post Office (1870); the Cutlers' Hall (1832-67), with a Corinthian façade; Masonic Hall (1877); Norfolk Market Hall, 296 feet long by 113 wide, erected (1851) in Tuscan style at a cost of £40,000; Theatre Royal (1773; enlarged 1855); and the Albert Music Hall (1870-73), which, built in Italian style at a cost of £26,000, has a magnificent organ and can seat 3000 persons. Wesley College (1838), connected with the London University, in October 1878 has 19

masters and 256 students; and there are also a free grammar-school (1609), and a collegiate proprietary school (1835). Mr. Mark Firth is (1878) erecting large buildings for the accommodation of the classes connected with the Cambridge University Extension; and close by a spacious central school is being built, designed to furnish higher education to the most promising pupils of the fourteen Board schools. Besides four free libraries, S. has an Athenæum (1824), a Literary and Philosophical Society (1822), Public Library (1771), and St. George's Museum, founded for working men by Mr. Ruskin (1875); while among its charitable institutions are the General Infirmary (1797-1872), Public Hospital (1835-78), the Jessop Hospital for Women (1878), Shrewsbury Hospital (1673), and Firth Almshouses (1869). A fever hospital is about to be erected, and on the 16th September 1878 the foundation-stone was laid of a new workhouse at Fir Vale, which is to accommodate 1662 inmates, have a façade of 1100 feet, broken by a clock-tower 120 feet high, and cost £180,000. In 1836 were opened the Botanical Gardens (18 acres); in 1874 the Weston Park (12 acres), containing a free museum; in 1875 the Firth Park (35 acres); and the Duke of Norfolk further set apart three pieces of land (25 acres in all) as recreation grounds, 9th October 1878. Of monuments there are bronze statues of James Montgomery, and Ebenezer Elliot the Corn-Law Rhymers, a Crimean Memorial (1858) 60 feet high, a stone cross marking the spot where 339 victims of the cholera were buried in 1832, and a monument to the late Mr. G. Sykes, a distinguished art student of S. The Town Council has obtained extensive powers for making street improvements, involving an outlay of nearly £600,000, and these are now (1878) being carried out. S.'s most typical sights, however, are its numberless iron and steel works, which, while almost monopolising the older cementation process, include 18 out of the 110 Bessemer converters in Great Britain, and a large proportion of the furnaces for the Siemens-Martin processes. With 51 collieries working or sinking in the district, and firms so widely known as Firth's, Cammell's, Mappin's, or Brown's ceaselessly turning out huge armour plates, 81-ton guns, and every variety of cutlery, Britannia-metal, and electro-plating, S. does not seem to have turned the tide of its prosperity, in spite of home and foreign competition. The census returns (1871) of the employment of adults in the S. district furnish the surest insight into the extent and relative importance of S. industries:—Cutlery, 6003 persons; engaged in iron manufacture, 4003; file-makers, 2497; engaged in steel manufacture 1619; coalminers, 1619; engine and machine makers, 1060; scissor-makers, 729; tool-makers, 691; saw-smiths, 550; wire-makers, 231; brassfounders, 229; bricklayers 228, &c. S. publishes three daily and one bi-weekly newspaper, and returns two members to Parliament. The borough, extending over 19,651 acres, contained (1871) 48,496 inhabited houses (amongst them 1501 beer and public houses), and in June 1877 had a pop. of 274,914. The ancient manor of Hallamshire, of which S. is the capital, has for over five centuries been famous for its cutlery, and Chaucer's Miller bore a S. whittle in his hose. But during the 300 years that followed Chaucer's day the manufacture languished, and under James I. S. was a 'singularly miserable place,' with barely 2000 inhabitants, a third of whom were half-starved and half-naked beggars, besides a great number of deformed wretches. The charter granted to the Cutlery Company in 1624, only enumerates the ruder kinds of cutlery, and surgical instruments were first produced in the reign of George I. The modern history of S. is closely, and often unhappily, connected with that of Trades Unions (q. v.). The town narrowly escaped being burnt by Chartists, 12th January 1840; and was drowned by the bursting of the Bradfield Reservoir, 12th March 1864, when 276 lives were lost and property destroyed to the value of £500,000. The Social Science Congress met at S. (1865), the British Archaeological Association (1873), the Trades Unions Congress (1874), the British Medical Association (1877), the Church Congress and Associated Chambers of Commerce (1878). See Hunter's *History of Hallamshire* (1819; new and enlarged ed. by Dr. A. Gatty, 1869), the Rev. A. Gatty's *S. Past and Present* (Sheff. 1873), and R. E. Leader's *Reminiscences of Old S.* (Sheff. 1876).

Sheffield, John, Duke of Buckinghamshire, was born in 1649, and in his tenth year succeeded his father as Earl of

Mulgrave. By the time he was twenty-five he had served in two naval wars against the Dutch, obtained the Garter and a colonelcy, and been appointed Gentleman of the Bedchamber; in 1680 he successfully commanded an expedition sent to the relief of Tangiers; and in the reigns of James, William, and Anne he held office in Tory administrations as Lord Chamberlain, Lord Privy Seal, Lord Steward, and Lord President of the Council. Created Marquis of Normanby by William (1694) and Duke of Buckinghamshire by Anne (1705), S., from the accession of George I., and consequent rise of the Whigs to power, continued the opponent of the court party down to his death, 24th February 1721. A brilliant orator, a sharp-judging politician, and a free-thinker, the Duke of Buckinghamshire, like him of Buckingham, was also—to follow Dryden's phrase—'the Muse's friend, himself a Muse.' At least, he published anonymously insipid Essays on Satire (1679) and Poetry (1682), besides some occasional pieces in prose collected in his *Works* (2 vols., 1723); and he numbered among an admiring clientage of poets, Pope, Prior, and 'Glorious John.' See the account of him in Johnson's *Lives of the Most Eminent English Poets*.

Sheil, Richard Lalor, born at Drumdowney, Waterford, 17th August 1791, and educated at Stoneyhurst (1804-07), graduated at Trinity College, Dublin (1811), and was called to the Irish bar (1814). During the years 1816-22 he wrote six dramas, in 1822 contributed to the *New Monthly* his brilliant *Sketches of the Irish Bar* (2 vols. 1855), and becoming in the same year a member of the Catholic Association, devoted himself with O'Connell to the cause of Catholic Emancipation. In 1829 he received his silk gown, in 1830 entered Parliament, and having there proved himself one of the greatest orators of the day, became a commissioner of Greenwich Hospital (1838), Vice-President of the Board of Trade (1839), Judge-Advocate-General (1841), Master of the Mint (1846), and British Minister at Florence (1850), where he died 23d May 1851. See his *Memoirs* by W. T. M'Cullagh (2 vols. 1855).

Sheik (Arab. 'elder'), the name originally of the chief or head of an Arab tribe, but now widely used among Moslems as a title of respect or reverence. The chief Mufti (q. v.) of Constantinople is the *S. al-Islam*, and the title S. is common to the heads of Mohammedan monasteries, and to the higher order of priests who preach in the mosque. It is gradually becoming the mere equivalent of Mr., Herr, &c., before names.

Shekel (Heb. 'weight') was a definite weight of gold or silver, which passed as current money among the ancient Hebrews (Gen. xlii. 15, 16; Exod. xxi. 32, &c.). There is no evidence of coined money having been used by them before the time of Ezra, when the Persian daric was in circulation (Ezra ii. 69; Neh. vii. 72 diam). Three different kinds of S. seem to be mentioned—the ordinary S., the S. 'of the sanctuary' (Exod. xxx. 13), and the S. 'after the king's weight' (2 Sam. xiv. 26), but there is no evidence that these were actually different weights. The S. of gold, however, was double that of silver. Silver coins of the weight of a S. were struck by Simon Maccabæus (B.C. 140), who received that privilege from Antiochus VII. (1. Macc. xv. 6). The average weight of the best extant specimens of these is 220 grains; and the standard S. before the Captivity was probably a little more, say 240 grs. or $\frac{1}{2}$ oz. Valuing silver at 5s. per oz., and gold at £4, the old S. of silver would be worth about 2s. 6d., of gold about £4; the silver S. (coin) about 2s. 3d.; the gold, which, according to Josephus (*Ant.* in. 8, 10), was the same as the daric, or 129 grs., about £1, 1s. 6d.

Shelburne, William Petty, Earl of, son of the first earl, and great-grandson of Sir William Petty (q. v.), was born in Dublin, 20th May 1737. After a neglected youth he went up to Oxford in his seventeenth year; there studied law, history, the classics, and 'a good deal of religion'; and in 1757 joined the 20th regiment under Wolfe. His services at Minden and Kloster Kempen were rewarded by a colonelcy and the post of aide-de-camp to the King, much to the Whigs' annoyance. In 1761 he entered Parliament as member for Wycombe, but within a few weeks was raised to the Upper House by his father's death, and in the same year negotiated the coalition between Fox and Bute. He defended the Government in the peace debate, and on Bute's transference of the premiership to Grenville (1763) accepted the presidency of the Board of Trade, but owing to

differences with the Secretary of State soon resigned, and attached himself to Pitt, his estimate of whom had changed about this period. With Pitt, now Earl of Chatham, he returned to office in 1766 as Secretary of State for the southern or colonial department. Staunchly opposing the faineant foreign and arbitrary domestic policy of the Bedford faction, he found the post no easy one—his Irish measures thwarted, his protest against the French annexation of Corsica unheeded, himself the single assailant of coercion towards the American colonists. Close on his own resignation (19th October 1768) succeeded Chatham's, and from the troubles and disputes of the Grafton and North administrations S., having lately become a widower, withdrew for a time to the Continent (1771). At Paris, in Mme. Geoffrin's *salon*, he met, amidst a host of notabilities, Morellet, the Adam Smith of France, to whom he owed his conversion to Free-trade principles, and whom, with Franklin, Garrick, and Priestley, he afterwards entertained at Bowood. Lexington, Saratoga, and France's alliance with the Colonies had brought Lord North upon his knees, the nation clamoured for Chatham's recall, when the 'Great Commoner' died (1778), and left in S. his recognised successor. During the brief and discordant Rockingham administration S. shared with Charles Fox (q. v.) the secretaryship of state; its dissolution was followed by his own scarce longer ministry (July 1782-February 1783). Short as this was, it witnessed the triumphant close of the siege of Gibraltar, the concession of independence to the United States, the conclusion of separate treaties with France and Spain; and with such results achieved S. could afford, at the bidding of the Fox and North coalition, to resign the Treasury and bid farewell to ministerial life, in 1785 being raised to the Marquisate of Lansdowne (q. v.). Thenceforth, though he opposed the war with revolutionary France and warmly upheld the Irish Union, he rarely emerged from his retirement at Bowood, Wiltshire, where he died, 7th May 1805. History has dealt but scant justice to S., whose very failures were due to a far sightedness that made him overlook the petty wants of the moment. The taunt of duplicity, launched against him, is confuted by his consistent Liberalism; a later generation has justified his most Utopian schemes—of free-trade, reform, and Catholic emancipation. For his great-grandson, Lord Edmund Fitzmaurice, was reserved the honour of vindicating an illustrious ancestor, in the *Life of William, Earl of S.* (3 vols. Lond. 1875-76), the first volume of which contains a fragment of S.'s autobiography.

Shelif, or Chelif, the principal river of Algeria. It rises in the Jebel Amour, flows successively N. and W., and enters the Mediterranean between Algiers and Oran, after a course of 370 miles.

Shell, the name given generally to the hard structures secreted by various *Invertebrate* animals, but distinctively to the exoskeleton of *Mollusca* (q. v.), which consists of a limy or calcareous investment formed by the *pallium* or *mantle*. All structures not formed by the mantle, however similar in appearance to shells, are not to be regarded as such. For example, the *argonaut* or paper nautilus, a delicate papery cover, which is not, however, a true S., inasmuch as it is not secreted by the mantle, but by two of the *arms* or *feet* of the animal modified for this purpose. On the other hand, the two-gilled cuttlefish, which has no outer S., has a horny or limy structure utterly unlike a S. imbedded in the mantle or investing skin, and formed by it. Hence this structure, despite its unlikeness to a S., is to be considered a true S. The name *test* is given to structures which are of the nature of shells, but which are formed by other animals than molluscs. Thus among the lowest animals or *Protozoa* (q. v.) we find the *Foraminifera* (q. v.) and *Radiolaria* (q. v.) making *tests* of lime and flint, some of which imitate exactly the shape of the S. of mollusca. The *Echinodermata*, including the *Echini* or 'sea urchins,' secrete a complicated S. or test formed of hexagonal limy plates disposed in meridional series; and among the *Crustacea* are found 'shells' of hardened or limy epidermis which may be annually cast off and renewed. The S. of the barnacles consists of a regular series of limy pieces articulated together, and closely resembling in some respects the true or molluscan S.

True shells, as found in molluscs, are divisible according to form into *univalve*, *bivalve*, and *multivalve*. The first of these is fully described in the article *Gasteropoda* (q. v.), the second under *Brachiopoda* (q. v.) and *Lamellibranchiata* (q. v.), and

the third under *Chiton* (q. v.). The S. is usually formed of lime; with a proportion of organic matter. The lime exists in the atomic proportions of *calcite*, although in some groups (e.g. the *Pholadidae*, a boring mollusca) the S. may be composed of *aragonite*—a much harder substance, and an allotropic form of calcic carbonate. Freshwater shells in particular (e.g. Freshwater mussels) have a *periostracum*, or outer covering of horny matter, which is believed to prevent the injurious action on the S. of the carbonic acid of the water. As to composition, three chief varieties of S. are distinguished. These are (1) the *pucellaneous*, in which three layers are to be discerned, each layer consisting of delicate limy plates set on edge, and occasionally varying in their direction; (2) the *fibrous* S. consists of layers of prismatic cells; and the (3) *nacreous* S. are formed of limy matter into the composition of which *nacre* or *Mother-of-Pearl* (q. v.) enters.

Shell, in artillery, a hollow projectile containing a bursting charge of gunpowder, which is exploded either by a 'time' or a 'percussion' fuze. It is the offspring of the *olle* or 'firepots' of the ancients, which held the celebrated Greek fire. The use of explosive projectiles has been known to the Chinese from a very remote period. Small shells (grenades) were thrown by hand, slings, or other means, before they were used with mortars. The earliest recorded employment of mortar and S. is at Jadra in 1376 by the Venetians. Horizontal fire of shells from howitzers, and afterwards from guns, was first attempted in the 18th c.

Spherical shells are fired from smooth-bore ordnance, and elongated shells from rifled guns. British Service smooth-bore are classed as *common* and *Shrapnel*. The former include *common*, *mortar*, *naval*, and *hand-grenade* shells, which are simply spheres filled with heavy charges of gunpowder. The *personnel* of an enemy suffers from a common S. bursting during flight, but if it explodes when at rest it acts like a mine in destroying parapets, *materiel*, &c. Shrapnel S. takes its name from Colonel Shrapnel, R.A., who about 1781 conceived the idea of filling S. with bullets to take effect at ranges beyond grape- or case-shot. Such a S. was first employed at Roliça and Vimiera in 1808. The fundamental principles of the Shrapnel S. are (1) a small bursting charge sufficient to open the S. and release the bullets with a minimum dispersive effect, and (2) a maximum firing charge to impart high velocity to the S. The Diaphragm Shrapnel S. for smooth-bore ordnance, introduced by Colonel Boxer in 1852, and now in general use, is shown in section with fuze complete in fig. 1.

Fig. 1. Section of Boxer Diaphragm Shrapnel Shell with fuze.

The bursting charge is better disposed than in the original, for the rupture of the S. without scattering the balls, and it is also completely separated from them by a diaphragm. The musket and carbine bullets are surrounded by coal-dust. Shrapnel is fired from guns, howitzers, and carronades against masses of troops, the explosion being timed to occur at a short distance in front. This, as well as the common smooth-bore S., is fitted with a wood bottom which serves to keep it in the proper position (with the fuze outwards) during discharge.

An elongated S. for use with rifled ordnance is fitted on the circumference with gun-metal studs, or on the base with a copper *sabot*, to take the grooves. Figs. 2, 3, and 4 show sections of the principal muzzle-loading rifled shells of the British Service. Fig. 2 illustrates the 8-inch Boxer-Shrapnel S. (weight 170 lbs., bursting charge 1 lb.). The bullets are embedded in resin and separated by an iron diaphragm from the bursting charge placed in the base of the S., and a tube passing down the centre connects the fuze in the apex with the powder-chamber. On explosion the bullets receive a forward impetus which to some extent counteracts the tendency to lateral dispersion arising from rotary motion of the S. The head is only lightly attached to the body, and 'lines of least resistance' are formed in the S. by grooving it internally. Fig. 3 shows a 12-inch Palliser S. of chilled iron with ogival head (weight 700 lbs.). The charge (9½ lbs.) held in a serge bag is placed in the hollow, and on impact it explodes, no fuze being required. A 10-inch 'common' S. of cast iron (average weight 398 lbs., bursting

charge 20½ oz.) is represented in fig. 4. It is burst by means of a fuze fitted in its apex. Martin's S. is a cast-iron globe filled with molten iron, and is employed to set ships, stores, &c., on fire.

Rifled Muzzle-loading Shells.

Other noteworthy British inventions are the Armstrong, Whitworth, and Lancaster shells. Among American inventions the most important are the Parrott, Dyer, Hotchkiss, Schenckle, Reed, and Blakely projectiles. These are all on the 'expansive' or 'American system,' as opposed to the Prussian 'compressive system.' They are used without respect to the rifling, and by the action of the gases of discharge on a peculiar device are forced to 'take the grooves.' The objection to expansive projectiles, that they cannot sustain heavy charges, has been met by recent improvements, as seen in the United States cored-shot.

Shell-drake, Shel-drake, or Sheil-drake (*Tadorna vulpanser*), a species of duck, inhabiting Britain, in winter especially, and attaining a length of 7 feet. The plumage is green on the head, chestnut over the forehead of the back, and white behind. The name 'Burrow Duck' is given to the bird, from its habit of laying its eggs in the disused burrows of rabbits. The Ruddy S. (*Casarka rutila*) is occasionally found in Britain, but is more common on the Continent. The S. has a peculiar modification of the lower larynx or organ of voice, rendering its voice harsh and loud.

Shelley, Percy Bysshe, grandson of Sir Bysshe Shelley, was born 4th August 1792, at Field Place, Sussex. At the village school of Warnham, at Sion House School in Brentford, and at Eton, the sensitive and delicate boy grew towards a premature manhood which asserted itself in pronounced atheism and wild romances. Two of these romances, interesting only for the amazing breadth of their extravagance, were actually printed, *Zastrozzi* in 1809, and *St. Irvyne, or the Rosicrucian*, in 1818. For *Zastrozzi* the publisher paid £40. S. likewise contributed the greater part of a volume entitled *Original Poetry, by Victor and Cazire* (1810). Of this book he had 1480 copies printed, but all were destroyed, on the discovery that a pirated poem of Monk Lewis was contained in the collection. In the autumn of 1810 S. went to University College, Oxford, where, along with a fellow-student named Hogg, he published some burlesques, as *Posthumous Fragments of Margaret Nicolson*, edited by John Fitzvictor. But the circulation of a pamphlet (consisting of one sheet) on *The Necessity of Atheism* led to his expulsion by the college authorities. On March 1811 S. left Oxford, and in September of the same year he eloped to Edinburgh with Harriet Westbrook, daughter of a London hotel-keeper. In spite of his theory regarding the relation of the sexes, the poet married the girl in Edinburgh; but he never found in her the companion he

600

sought. She was beautiful but small-minded; and when, in London, S. met Mary, the daughter of William Godwin, Harriet was deserted. The unfortunate woman then gained from other men a protection that added guilt to her misery, and ere long she drowned herself in the Serpentine (November 10, 1816). In July of 1814 S. went to the Continent with Mary Godwin, whom he married on the death of his first wife. If his relations towards Harriet involved him in pain and obloquy, his connection with Mary Wollstonecraft's daughter brought him only the purest happiness. In 1813 he had printed *Queen Mab*, a poem with which he hoped to sweep the world clear of religion. Afterwards he despised this juvenile effort; and, indeed, it contains nothing that can satisfy the reader either in form or substance. For a time he settled at Bishopsgate, near Windsor Forest, and there he composed his first great poem, *Alastor* (1816). Then followed *The Revolt of Islam* (1818), after the publication of which S. migrated to Italy, never to return. In 1818 he completed *Rosalind and Helen*, and the same year brought out *Julian and Maddalo*, a fine poem recording some of his intercourse with Byron. In the next year were composed S.'s grandest works, *Prometheus Unbound* (not published till 1821) and the *Cenci*. In the *Prometheus* he utters the cry of modern spiritual unrest, while he worships nature like a Greek. The poem is ethereal, cold, majestic—beautiful as a sea of ice in the moonlight. In the *Cenci* he creates a character for the first and last time, and in hard, firm lines moulds revolting crimes into passionate and pitiful tragedy. So far does he command our sympathy in the play, that we are compelled to assent to the justice of a parricide. After these immortal works came the grotesque *Peter Bell the Third* (1819), *The Witch of Atlas* (1820), and *Edipus Tyrannus, or Swellfoot the Tyrant* (1820), the latter suppressed at the instance of the Society for the Suppression of Vice. *Epipsychidion* (1821) lamented the death of the author's friend Emilia Viviani, and *Adonais* (1821), perhaps the greatest elegy in all literature, deplored the loss of Keats. *Hellas* (1821) was the result of the Greek Revolution, and is fired with glorious hopes. His enthusiasm culminates in lyric raptures of unsurpassable loveliness. On the 8th of July 1822, the poet was sailing from Leghorn with some friends on his way to Lerici, when a squall overturned the schooner which carried the party. S. was drowned, with Keats's poems in his pocket.

S.'s soul was the very spirit of freedom, and in his imaginary world he legislated for all men like himself. His teaching was not understood, and could have done no good to any bold enough to follow it. In his lifetime he was regarded as a beautiful demon; nowadays, biographers speak of him as a maligned saint. He was sometimes very selfish, but habitually generous; is known to have told absolute falsehoods, yet in the tenor of his life and his works inculcated the purest reverence for truth. Right or wrong, he always thought intensely, and spoke vehemently. His life was restless, unhappy, but pure and beneficent. He was irreligious on principle, but a Christian in practice. As a poet he has not the masculine vigour of Byron, or Keats's quaint luxury of language, but he is more finely intellectual than either, and his verse has a subtle and thrilling melody that no English poet has ever equalled.

Mrs. S. wrote several books during her husband's lifetime, the best known being the novel of *Frankenstein*. She edited her husband's poems, with preface and biographical notes, in 1839. The most complete critical editions of S. are those of Rossetti (3 vols. 1878), and Forman (4 vols. 1876-77). See Medwin's *Life of S.* (1849); *Recollections of the Last Days of S. and Byron*, by Trevelyan (new ed. 2 vols. 1878); Hogg's *Life of S.* (2 vols. 1858); Middleton's *S. and his Writings* (2 vols. 1858); *S. Memorials*, by Lady Shelley, with essay by S. on Christianity, 1859; Garnett's *Relics of S.* (1862); Barnett Smith's *S., a Critical Biography* (1877); and Rossetti's *Lives of the Poets* (1878).
